Source: POWER 2013a, 2013b.
[1] Some cultural resources described in the survey report (POWER 2013a, 2013b) are not included in this table because the sites are no longer within the APE as a result of changes in Project design.

Native American and Agency Coordination

In the course of developing information about the archaeological and historic resources that could be affected by the Project, contacts were made with Native American tribes and relevant public agencies, including representatives of the Agua Caliente Band of Cahuilla Indians, Augustine Band of Cahuilla Indians, Cabazon Band of Mission Indians, Cahuilla Band of Mission Indians, Chemehuevi Indian Tribe, Cocopah Indian Tribe, Colorado River Indian Tribes, Fort Mojave Indian Tribe, Fort Yuma Quechan Tribe, Morongo Band of Mission Indians, Ramona Band of Mission Indians, San Manuel Band of Mission Indians, Soboba Band of Luiseño Indians, Torres-Martinez Desert Cahuilla Indians, and Twenty-Nine Palms Band of Mission Indians. Contacts also included the cultural resource representatives of relevant public agencies including the Native American Heritage Commission (NAHC), State Historic Preservation Officer (SHPO), the Advisory Council on Historic Preservation (ACHP) and the County of Riverside. Please refer to Chapter 6 of this Draft EIR/EA for more information about this coordination.

Regulatory Setting

Federal

Regulations Relating to Archaeological and Architectural Resources

NEPA (42 U.S.C. §§ 4321-4346) establishes national policy for the protection and enhancement of the environment. Part of the function of the federal government in protecting the environment is to “preserve important historic, cultural, and natural aspects of our national heritage.” The act is implemented by the Council on Environmental Quality (CEQ) regulations at 40 CFR Parts 1500-1508. Refer to Sections 1.3 and 1.4 for more information regarding NEPA as it relates to this Project.

National Historic Preservation Act

The National Historic Preservation Act (NHPA), as amended (16 U.S.C. § 470f), is the principal federal law in the United States protecting cultural resources. Section 106 of the NHPA directs all federal agencies to take into account the effects of their undertakings (i.e., actions, financial support, and authorizations) on properties included in or eligible for inclusion in the NRHP and to allow the ACHP an opportunity to comment. ACHP regulations at 36 CFR Part 800 implement Section 106 of the NHPA. These regulations establish the NRHP as a planning tool to help federal agencies evaluate cultural resources in consultation with the SHPO, Native American tribes, and other interested parties. The criteria for determining whether cultural resources are eligible for listing in the NRHP is provided in 36 CFR Part 60.4. These criteria are:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and:

A) Are associated with events that have made a significant contribution to the broad patterns of our history;
B) Are associated with the lives of persons significant in our past;
C) Embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; possess high artistic value, or represent a significant and distinguishable entity whose components may lack individual distinction; or
D) Have yielded, or may be likely to yield, information important in prehistory or history.

A cultural resource that is eligible for the NRHP is called a historic property regardless of the time period to which it dates. To be listed in, or determined eligible for, the NRHP a cultural resource must meet one or more of the above criteria and possess integrity. Integrity is defined as the authenticity of a resource's historic identity as evidenced by the survival of physical characteristics that existed during the prehistoric or historic period of use. The NRHP recognizes seven aspects, which in various combinations define integrity: location, design, setting, materials, workmanship, feeling, and association. Integrity of location means that the resource has not been moved from its historic location. Integrity of design, materials, and workmanship mean that the resource's original building materials, plan, shape, and design elements remain intact. Integrity of setting means that the surrounding landscape has changed very little since the period of importance for the resource. Integrity of feeling and association means the resource retains a link to an earlier time and place and is able to evoke that era. Historic properties must generally be at least 50 years old; however, a younger resource may be considered eligible if it is of exceptional importance.

An undertaking results in adverse effects, or impacts, to a historic property (i.e., a cultural resource eligible to or listed in the NRHP) when it alters the resource's characteristics, including relevant features of its environment or use, that qualify it for inclusion in the NRHP. Potential effects could include (36 CFR Part 800.5(a) (2)):

- Physical destruction, damage, or alteration of all or part of the property;
- Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation and provision of handicapped access, that is not consistent with the Secretary's Standards for the Treatment of Historic Properties (36 CFR Part 68);
- Removal of the property from its historic location;
- Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- Introduction of visual, audible, or atmospheric elements that are out of character with the property or alter its setting;
- Neglect of a property resulting in its deterioration or destruction; and
- Transfer, lease, or sale of the property.

Compliance with Section 106 is required whenever a project has a federal nexus, meaning that the project is on federal land, uses federal funds, or is permitted by a federal agency. The BLM is reviewing an application for and will make a decision on issuing a new ROW grant for the proposed gen-tie line. This activity constitutes an undertaking as defined in 36 CFR Part 800.16(y) and requires compliance with Section 106.

The BLM considers the development of the proposed solar generation site to be a connected action, even though the solar facility would not be on federal land. The BLM's 8100 manual series on cultural resources explains BLM's Section 106 responsibility on non-federal lands. Factors taken into consideration include the degree of federal involvement; the nature and extent of potential effects on historic properties; the likely nature and the location of historic properties in the APE; and the views of the SHPO, Native American tribes, and interested public. However, the primary factor is the extent to which BLM's authorization (in this case of the proposed gen-tie line) could result in effects to historic properties, including properties within the proposed solar facility.

Antiquities Act

The Antiquities Act of 1906 (16 U.S.C. § 431-433) was the first law to protect and preserve cultural resources on federal lands. It makes it illegal to remove cultural resources from federal lands without a permit and establishes penalties for illegal excavation and looting. The Archaeological Resources Protection Act (see below) reinforces and replaces portions of the Antiquities Act as the authority for special use permits regarding archaeological investigations.

Federal Land Policy and Management Act

The FLPMA (43 U.S.C. § 1701) requires the BLM to manage its lands on the basis of multiple use in a manner that will "protect the quality of…historical…resources and archaeological values." FLPMA is a comprehensive law that provides for the periodic inventory of public lands and resources, for long-range, comprehensive land use planning, for permits to regulate the use of public lands, and for the enforcement of public land laws and regulations. FLPMA compels agencies to manage all cultural resources on public lands through the land management planning process.

Archaeological Resources Protection Act

The Archaeological Resources Protection Act of 1979 (16 U.S.C. § 470 aa-mm) establishes civil and criminal penalties for the unauthorized excavation, removal, damage, alteration, or defacement of archaeological resources; prohibits trafficking in resources from public lands; and directs federal agencies to establish educational programs on the importance of archaeology. The act also establishes permit requirements for removal or excavation of archaeological resources from federal lands. The law applies to archaeological resources more than 100 years old found on public lands. No distinction is made regarding NRHP eligibility.

American Indian Religious Freedom Act

The American Indian Religious Freedom Act of 1978 requires federal agencies to consult Native American groups when a proposed land use might conflict with traditional Indian religious beliefs or practices; to avoid interference with these beliefs to the extent possible; and to maintain access to religious or sacred areas whenever feasible.

Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 U.S.C. § 3001) provides a process for federal agencies to return certain Native American cultural items—human remains, funerary objects, sacred objects, or objects of cultural patrimony—to lineal descendants and culturally affiliated Indian tribes. NAGPRA includes provisions for unclaimed and culturally unidentifiable Native American cultural items, intentional excavation and unanticipated discovery of Native American cultural items on federal lands, and penalties for noncompliance and illegal trafficking. Permits for the excavation

or removal of cultural items protected by the act require Tribal consultation, as do discoveries of cultural items made during activities on federal lands. The Secretary of the Interior's implementing regulations are at 43 CFR Part 10.

Executive Order 11593, Protection and Enhancement of the Cultural Environment

Issued in 1971, Executive Order 11593 directs land-holding federal agencies to identify and nominate historic properties to the NRHP and requires that these agencies avoid damaging historic properties that might be eligible to the NRHP. It also directs agencies to treat resources eligible for listing in the NRHP as if they were already listed.

Executive Order 13007, Indian Sacred Sites

Executive Order 13007, issued in 1996, directs federal agencies responsible for managing federal lands to accommodate access to, and ceremonial use of, Indian sacred sites by Indian religious practitioners; avoid adversely affecting the physical integrity of such sacred sites; and maintain the confidentiality of sacred sites.

Executive Order 13175, Consultation and Coordination with Indian Tribal Governments

Executive Order 13175, issued in 2000, directs federal agencies to establish regular and meaningful consultation and collaboration with Tribal officials in the development of federal policies that have Tribal implications, to strengthen the United States government-to-government relationships with Indian tribes, and to reduce the imposition of unfunded mandates upon Indian tribes.

Executive Order 13287, Preserve America

This Executive Order, issued in 2003, encourages the federal government to take a leadership role in the protection, enhancement, and contemporary use of historic properties and establishes new accountability for agencies with regard to inventories and stewardship.

Memorandum for the Heads of Executive Departments and Agencies Regarding Government-to-Government Relations with Native American Tribal Governments

The Presidential memorandum, issued in 2009, directs each federal agency to operate within a government-to-government relationship with federally recognized Tribal governments; consult with Tribal governments; assess the impact of plans, projects, programs, and activities on Tribal trust resources; and ensure that Tribal rights are taken into account during consideration of such plans, projects, and activities.

State

The principal State law relevant to the protection of cultural resources within the solar generation site and gen-tie Alternatives is CEQA, with particular reference to California PRC 21083.2 to 21084.1, which addresses historical resources, unique archaeological resources, and Native American human remains.

Section 5097.5 of the PRC specifies that any unauthorized disturbance or removal of archaeological and historical resources located on public lands is a misdemeanor. This Section also prohibits the knowing destruction of objects of antiquity without a permit (expressed permission) on public lands, and provides for criminal sanctions. In addition, Section 30244 of the PRC requires reasonable mitigation for adverse impacts on archaeological resources as identified by the SHPO. Further, California Penal Code, Section 622.5, provides misdemeanor penalties for willfully injuring or destroying objects of historic or archaeological interest located on public or private lands, but specifically excludes the landowner.

Historical Resources

Lead agencies are required to identify historical resources that may be affected by any undertaking involving State or county lands, funds, or permitting. Also, the significance of such resources that may be affected by the undertaking must be evaluated using the criteria for listing in the CRHR (PRC §5024.1, Title 14 CCR, Section 4852). Under CEQA, a resource is considered historically significant if the resource satisfies any of the following criteria:

1) A resource listed in, or determined to be eligible by the State Historical Resources Commission for listing in, the CRHR (PRC §5024.1, Title 14 CCR, Section 4850 et seq.).

2) A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the PRC or identified as significant in an historical resource survey meeting the requirements section 5024.1(g) of the PRC, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
3) Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the CRHR (PRC §5024.1, Title 14 CCR, Section 4852) including the following:

   A) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
   B) Is associated with the lives of persons important in our past;
   C) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
   D) Has yielded, or may be likely to yield, information important in prehistory or history.

4) The fact that a resource is not listed in, or determined to be eligible for listing in, the CRHR, not included in a local register of historical resources (pursuant to section 5020.1(k) of the PRC), or identified in an historical resources survey (meeting the criteria in Section 5024.1(g) of the PRC) does not preclude a lead agency from determining that the resource may be an historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

Resources already listed or determined eligible for the NRHP and CHL (No. 770 and above) are by definition eligible for the CRHR. Historical resources included in resource inventories prepared according to California State Office of Historic Preservation (OHP) guidelines or designated under county or city historic landmark ordinances may be eligible.

For a resource to be eligible for the CRHR, it must satisfy each of the following three standards:

- A property must be significant at the local, state or national level, under one or more of the following criteria:

1) It is associated with events or patterns of events that have made a significant contribution to the broad patterns of the history and cultural heritage of California and the United States.
2) It is associated with the lives of persons important to the nation or California's past.
3) It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4) It has yielded, or may be likely to yield, information important to the prehistory or history of the state or the nation:

- A resource must retain enough of its historic character or appearance to be recognizable as a historic property, and to convey the reasons for its significance; and
- It must be fifty years old or older (except for rare cases of structures of exceptional significance).

Integrity is defined as the authenticity of a historical resource's physical identity, evidenced by the survival of characteristics that existed during the resource's period of significance. CRHR regulations specify that integrity is a quality that applies to historical resources in seven ways: location, design, setting, materials, workmanship, feeling, and association.

Unique Archaeological Resources

Lead agencies must also determine whether a proposed project will have a significant effect on unique archaeological resources. PRC 21083.2(g) states:

> "…a 'unique archaeological resource' means an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
>
> Contains information needed to answer important scientific research questions and that there is demonstrable public interest in that information.
> Has a special and particular quality such as being the oldest of its type or the best available example of its type.
> Is directly associated with a scientifically recognized important prehistoric or historic event or person."

A non-unique archaeological resource does not meet these criteria and does not need to be given further consideration other than simple recording, unless it happens to qualify as a historical resource.

Native American Human Remains

The CEQA Guidelines (Section 15064.5 (d)) provide that when an initial study identifies the existence of, or probable likelihood of, Native American human remains within the Project, a lead agency will work with the appropriate Native Americans as identified by the NAHC.

Native American Consultation

Pursuant to Senate Bill (SB) 18 (California Government Code §65352.3), local governments are required to consult with California Native American tribes identified by the NAHC for the purpose of protecting and/or mitigating impacts to cultural places. SB 18 requires formal consultation with Native American tribes as part of a project that enacts or amends a general plan or specific plan. The proposed Project would not require a general plan or specific plan amendment; therefore, SB 18 does do not apply to the proposed Project. However, as described above, Native American Coordination has been initiated with Native American groups with historic ties to, and interest in, the proposed Project area.

Local

Riverside County General Plan- Multipurpose Open Space Element

The Multipurpose Open Space Element of the Riverside County General Plan (amended March 22, 2011) outlines policies intended to promote the preservation of cultural resources in the County of Riverside, as follows:

OS 19.2 -The County of Riverside shall establish a cultural resources program in consultation with Tribes and the professional cultural resources consulting community. Such a program shall, at a minimum, address each of the following: application processing requirements; information database(s); confidentiality of site locations; content and review of technical studies; professional consultant

qualifications and requirements; site monitoring; examples of preservation and mitigation techniques and methods; and the descendant community consultation requirements of local, state, and federal law. (AI-A)

OS 19.3 - Review proposed development for the possibility of cultural resources and for compliance with the cultural resources program.

OS 19.4 - To the extent feasible designate as open space and allocate resources and/or tax credits to prioritize the protection of cultural resources preserved in place or left in an undisturbed state, (AI-B)

OS 19.5 - Exercise sensitivity and respect for human remains form both prehistoric and historic time periods and comply with all applicable laws concerning such remains.

City of Blythe General Plan

The City of Blythe General Plan Open Space and Conservation Element addresses archaeological, historic, and paleontological resources. The purpose of the Open Space and Conservation Element is to identify those areas located within the City's Planning Area boundary that merit recognition or preservation because of their location use and/or natural, topographic, or aesthetic features. The applicable policy related to archaeological and paleontological resources is provided below.

Open Space and Conservation Element

Policy 25. Protect archaeological, historic, and paleontological resources for their aesthetic, scientific, educational, and cultural value.

3.2.6 Geology and Soils

This section describes the existing regional and local geology, soil conditions, and mineral resources, as well as regulatory framework in regards to geology, soils, and mineral resources for the proposed Project and Alternatives. Though the impact of the existing environment on the Project or Alternatives is not an impact encompassed by CEQA or NEPA, this section also identifies seismic hazards that could potentially affect structures associated with the Project to assist decision-makers in addressing regulatory concerns. The study area relevant to geology, soils, and geologic hazards is the physical footprint of Project construction, operation and maintenance, and decommissioning. The study area relevant to faulting and seismic hazards includes the larger Southern California region, because distant faults can produce ground shaking and secondary seismic hazards at the Project area. The information in this section is based on the *Limited Geological Reconnaissance Evaluation: Blythe Mesa Solar Project, Blythe, California*, prepared by Ninyo & Moore Geotechnical and Environmental Sciences Consultants, 2012 (provided in Appendix E of this Draft EIR/EA).

Environmental Setting

Regional Geology and Seismicity

The Project and Alternatives would be located on the eastern edge of the Colorado Desert Geomorphic Province in Riverside County, California. Within California, this geomorphic province encompasses an area that extends from the Colorado River on the east, the eastern Transverse Ranges on the north, the Mexican border on the south, and the Peninsular Ranges on the west. The Colorado Desert province is generally characterized by broad alluvial valleys separated by steep, discontinuous, sub-parallel mountain ranges that generally trend northwest-southeast.

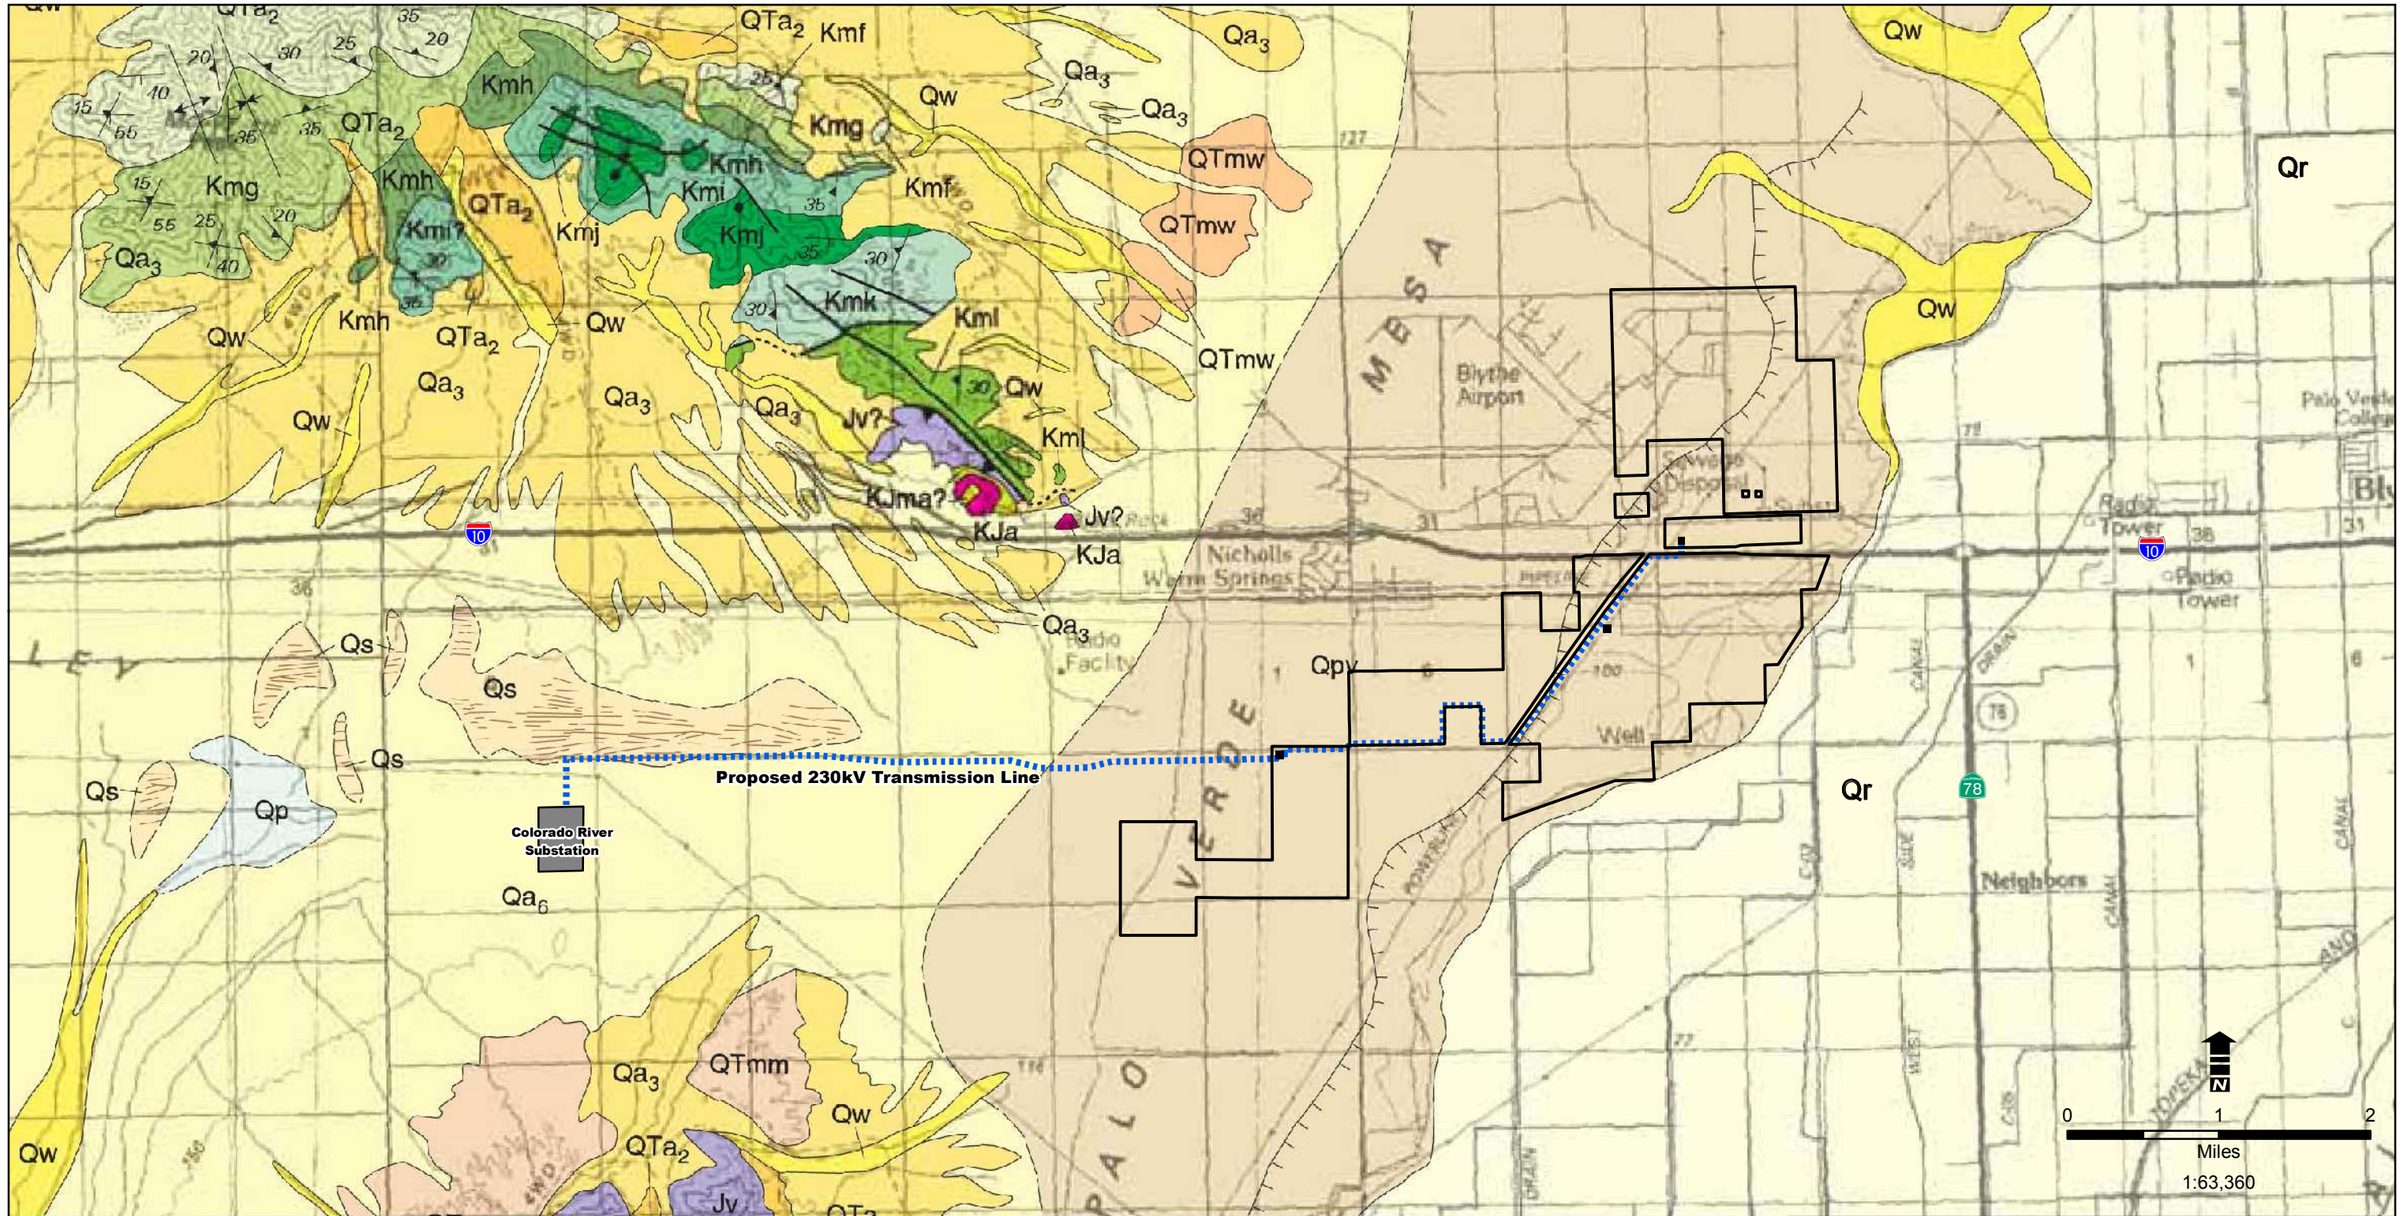
The Project and Alternatives would be located in a seismically active region of Southern California. Based on data compiled by the California Geological Survey, there are no known active faults that intersect the Project area, nor is the site located within a State of California Earthquake Fault Zone, formerly known as an Alquist-Priolo Special Studies Zone (Ninyo & Moore 2012). Specifically, the Project area is situated within the Sonoran zone, which is a relatively more stable tectonic region than areas further west. The

California Geological Survey defines an active fault as one that has had surface displacement during the Holocene age (roughly the last 11,000 years). Potentially active faults are those that show evidence of surface displacement during the Quaternary age (roughly the last 1.6 million years) but for which evidence of Holocene movement has not been established. An inactive fault is one that has not shown evidence of surface displacement during the Quaternary age. The nearest faults to the Project and Alternatives are inactive and located in the McCoy Mountains, approximately three miles east of the solar facility site and approximately two miles from the gen-tie line. The inactive faults are illustrated as bold black lines on Figure 3.2.6-1. Table 3.2.6-1 lists principal known active faults within 60 miles of the Project area, the approximate fault-to-site distances, and the maximum moment magnitudes[3] (Mmax).

TABLE 3.2.6-1 PRINCIPAL ACTIVE FAULTS

FAULT	APPROXIMATE FAULT-TO-SITE DISTANCE (MILES)	MAXIMUM MOMENT MAGNITUDE (MMAX)
Brawley Seismic Zone	57.9	6.4
Elmore Ranch	58.4	6.6
San Andreas (Coachella)	58.4	7.2

Source: Ninyo & Moore 2012.



Site Geology

Soils

According to the geotechnical study prepared for the proposed Project, the site is generally underlain by Quaternary age alluvium consisting of unconsolidated to weakly consolidated sand, silt, and gravel. Surficial deposits of aeolian sand (blow sand), gravels, and minor fill are also present across portions of the Project area. Generalized descriptions of the units encountered are described below. Generalized descriptions of the units encountered are described below and shown on Figure 3.2.6-1.

- Holocene age alluvium associated with modern washes (designated Qw) has been mapped near the northeastern portion of the Project area. These deposits are the result of erosion, transport, and deposition of sediments caused by winter storm systems or intense summer thunderstorms. The alluvial materials generally consist of fine to coarse sand with scattered to abundant gravel to cobble-size clasts.
- Holocene age alluvium of the modern Colorado River flood plain (designated Qr) has been mapped near the eastern boundary of the Project area. These deposits are associated with flood events associated with the Colorado River and are expected to consist of fine to coarse sand, silt, and clay.
- Holocene age aeolian sand (designated Qs) has been mapped near the western portion of the solar facility under the western portion of the Project's proposed gen-tie line, and consists of unconsolidated sand dunes and sheets. The dunes are partially stabilized by vegetation.
- Holocene age alluvial-fan and alluvial-valley deposits (designated Qa6) have been mapped under portions of the Project's proposed gen-tie line. This unit is characterized by sand, pebbly sand, sandy gravel, and occasional aeolian sand deposits. These sediments lack desert varnish, a dark coating on exposed rock surfaces in arid environments.

[3] The *moment magnitude scale* is used by seismologists to measure the size of earthquakes in terms of the energy released.

SITE GEOLOGY

BLYTHE MESA SOLAR PROJECT

POWER ENGINEERS | RENEWABLE RESOURCES GROUP

Source: Geologic map of the west half of the Blythe 30' by 60' quadrangle, Riverside County, California and La Paz County, Arizona, 2006.

THIS PAGE INTENTIONALLY LEFT BLANK

- Pleistocene age alluvial deposits in Palo Verde Mesa (designated Qpv) have been mapped across the majority of the solar facility. This unit consists of generally loose to very dense, silty, fine to medium sand with scattered interlayers of gravel.

Topsoil and alluvium (surficial soils) are also present in the Project vicinity; the boundaries of these soils are depicted on Figure 3.2.2-2 (see Section 3.2.2 above), with a legend that list regional and site-specific soils. Much of the site has been or is currently being utilized for agricultural purposes and it is expected that the upper one to two feet of soil have been disturbed as a result of agricultural activities.

Groundwater Conditions

According to the geotechnical report prepared for the proposed Project, the static groundwater table is anticipated to be below the depth of the proposed excavations. Based on previous borings performed by Ninyo & Moore at the Blythe Energy Center (located adjacent to the northern portion of the proposed solar facility), the static water table is in excess of 90 feet below the existing ground surface or at an elevation of approximately 245 feet amsl. Shallow perched groundwater or groundwater seepage may also be present at the Project area, particularly in or near areas of active citrus groves or other agricultural activities. Groundwater levels near the City of Blythe were reported at approximately 250 feet amsl (Ninyo & Moore 2012). It should be noted that groundwater levels are influenced by seasonal variations, variations in ground surface topography, precipitation, irrigation practices, soil/rock types, groundwater pumping, and other factors and are subject to fluctuations. For a more detailed description of hydrology and water resources, refer to Section 3.2.10, *Hydrology and Water Quality*.

Minerals

Riverside County contains diverse mineral resources, which include extensive deposits of clay, limestone, iron, sand, and aggregates. Geologic factors restrict mining operations to the relatively few locations where mineral deposits are feasible for extraction. MRZs (Mineral Resources Zones) within Riverside County are depicted on Figure OS-5, Mineral Resources, of the *Riverside County General Plan Multipurpose Open Space Element* (Riverside County 2003). The Project area is not used for mineral production, nor is it under claim, lease, or permit for the production of locatable, leasable, or salable minerals or mineral materials. However, the Project area is underlain by sand and gravel, which could potentially represent a source of saleable minerals or mineral materials if there is a sufficient local demand for construction aggregate. However, the Project area and vicinity have been classified as MRZ-4 for mineral resources (areas of unknown mineral resource significance) and is not designated as being of regional or state-wide importance (Ninyo & Moore 2012).

According to the geotechnical report prepared for the proposed Project, there are no past or present mines and no locatable mineral activity located on the Project area. Sand and gravel deposits are ubiquitous throughout the Quaternary geologic deposits in the vicinity of the Project area and the region. There are several past producers and one current producer of sand and gravel on the west side of the McCoy Wash, approximately five miles east of the Project area. In addition, there is one former producer of sand and gravel immediately to the east of the access road. None of the past or current producers of sand and gravel intersects the Project area.

According to review of the Mineral Resources Data System online database, metallic resources and occurrences (such as gold, silver, manganese, and copper) are restricted to the surrounding mountains, including the McCoy, Big Maria, and Mule Mountains, located outside of the Project area (USGS 2011). Numerous land sections within the mountainous areas have active mining claims, and there are two sites listed in the Mineral Resources Data System as mineral producers. However, none of these resources occurs within the vicinity of the Project area and they are unlikely to be found within the geologic units that underlie the Project area.

The California DOC, Division of Oil, Gas, and Geothermal Resources, indicates that there are no oil, gas, or geothermal resources present within or in the vicinity of the Project area (DOGGR 2013).

Regulatory Setting

Federal

International Building Code

The International Building Code (IBC) is published by the International Code Council (ICC) and is the national model building code. The 2012 IBC is the most recent edition of the International Building Code, and applies to all structures currently being constructed in California (ICC 2012). The national model codes are incorporated by reference into the building codes of local municipalities, such as the California Building Code (CBC) and County of Riverside Building Code as discussed below.

California Desert Conservation Area Plan

The CDCA Plan defines multiple-use classes for BLM-managed lands within the CDCA, which includes land area encompassing the Project area. With respect to mineral resources, the CDCA Plan aims to maintain the availability of mineral resources on public lands for exploration and development. A portion of the Project's gen-tie line extends through BLM-managed lands designated Class L, or limited use. Mineral exploration and development is allowed on Class L lands provided that NEPA requirements are met.

State

California Building Code

The CBC is promulgated under the CCR, Title 24, Parts 1 through 12 (also known as the California Building Standards Code), and is administered by the California Building Standards Commission. The Project is subject to the applicable sections of the CBC. The Riverside County Building Department is responsible for implementing the CBC for the Project. The Project would comply with applicable seismic design and construction criteria of the most recent CBC.

State Surface Mining and Reclamation Act of 1975

The Surface Mining and Reclamation Act of 1975 (PRC §2710 et seq.) mandated the initiation by the State Geologist of mineral land classification in order to help identify and protect mineral resources in areas within the State subject to urban expansion or other irreversible land uses that would preclude mineral extraction. The Surface Mining and Reclamation Act also allowed the State Mining and Geology Board, after receiving classification information from the State Geologist, to designate lands containing mineral deposits of regional or statewide significance. Mineral lands are mapped according to jurisdictional boundaries (i.e., counties), mapping all mineral commodities at one time in the area, using the California Mineral Land Classification System.

The objective of classification and designation processes is to ensure, through appropriate lead agency policies and procedures, that mineral deposits of statewide or of regional significance are available when needed. The State Mining and Geology Board, based on recommendations from the State Geologist and public input, prioritizes areas to be classified and/or designated. Areas that are generally given highest priority are those areas within the state that are subject to urban expansion or other irreversible land uses that would preclude mineral extraction.

Classification is completed by the State Geologist in accordance with the State Mining and Geology Board's priority list, into MRZs, as defined below. Classification of these areas is based on geologic and economic factors without regard to existing land use and land ownership. As stated above, the Project area and vicinity have been classified as MRZ-4 for mineral resources and are not designated as being of regional or state-wide importance (Ninyo & Moore 2012). The following MRZ categories are used by the State Geologist in classifying the state's lands:

***MRZ-1*:** Areas where adequate geologic information indicates that no significant mineral deposits are present, or where it is judged that little likelihood exists for their presence. This zone is applied where well developed lines of reasoning, based on economic-geologic principles and adequate data, indicate that the likelihood for occurrence of significant mineral deposits is nil or slight.

***MRZ-2a*:** Areas underlain by mineral deposits where geologic data show that significant measured or indicated resources are present. Areas classified MRZ-2a contain discovered mineral deposits that are either measured or indicated reserves as determined by such evidence as drilling records, sample analysis, surface exposure, and mine information. Land included in the MRZ-2a category is of prime importance because it contains known economic mineral deposits.

***MRZ-2b*:** Areas underlain by mineral deposits where geologic information indicates that significant inferred resources are present. Areas classified MRZ-2b contain discovered deposits that are either inferred reserves or deposits that are presently sub-economic as determined by limited sample analysis, exposure, and past mining history.

MRZ-3a: Areas containing known mineral deposits that may qualify as mineral resources. Further exploration work within these areas could result in the reclassification of specific localities into the MRZ-2a or MRZ-2b categories. MRZ-3a areas are considered to have a moderate potential for the discovery of economic mineral deposits.

***MRZ-3b*:** Areas containing inferred mineral deposits that may qualify as mineral resources. Land classified MRZ-3b represents areas in geologic settings that appear to be favorable environments for the occurrence of specific mineral deposits. MRZ-3b is applied to land where geologic evidence leads to the conclusion that it is plausible that economic mineral deposits are present.

***MRZ-4*:** Areas where geologic information does not rule out either the presence or absence of mineral resources. It must be emphasized that MRZ-4 classification does not imply that there is little likelihood for the presence of mineral resources, but rather there is a lack of knowledge regarding mineral occurrence.

Local

Riverside County General Plan – Palo Verde Valley Area Plan

Portions of the Palo Verde Valley planning area may be subject to seismic hazards. Threats from seismic events include ground shaking, fault rupture, liquefaction, and landslides. In the Palo Verde Valley planning area, liquefaction poses the most significant threat from a seismic event. Generally, the use of building techniques and practical avoidance measures help mitigate potentially dangerous seismic events. The PVVAP provides the policy related to seismic hazards below.

PVVAP 15.1. *Protect life and property from seismic related incidents through adherence to the Seismic Hazards section of the General Plan Safety Element.*

Riverside County contains diverse mineral resources, which include extensive deposits of clay, limestone, iron, sand, and aggregates. Geologic factors restrict mining operations to the relatively few locations where mineral deposits are feasible for extraction. MRZs within Riverside County are depicted on Figure OS-5, Mineral Resources, of the Riverside County General Plan Multipurpose Open Space Element (Riverside County 2003). The solar facility currently consists of undeveloped and agricultural land. A portion of the Project's gen-tie line extends through BLM-managed lands. The Project area appears to contain no mineral resources, and no mining activities occur in the vicinity of the Project.

City of Blythe General Plan

The City of Blythe General Plan Safety Element addresses hazards and disasters, and sets forth the policy basis for the City's response to potential seismic hazards. Applicable policies related to seismic hazards are included in the City of Blythe General Plan 2025 and are provided below.

Safety Element

Policy 5: *Maintain and enforce appropriate building standards and codes to avoid and/or reduce all risks associated with geologic constraints.*

Policy 6: *Ensure through available engineering solutions that buildings designed for human habitation will not be adversely impacted by geological hazards*.

Policy 7: *Educate the public about potential geologic hazards in Blythe and maintain emergency response policies*.

3.2.7 Greenhouse Gas Emissions

This section describes the environmental setting and regulatory framework in regards to greenhouse gas (GHG) emissions for the proposed Project and Alternatives. Emissions and impacts associated with criteria air pollutants were addressed in Section 3.2.3.

Environmental Setting

Characteristics and Definition

Global climate change refers to changes in average climatic conditions on Earth as a whole, including temperature, wind patterns, precipitation, and storms. Global temperatures are moderated by naturally occurring atmospheric gases, including water vapor, carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), which are known as GHGs. These gases allow solar radiation (sunlight) into the Earth's atmosphere, but prevent radiative heat from escaping, thus warming the Earth's atmosphere. Gases that trap heat in the atmosphere are often called greenhouse gases, analogous to a greenhouse, and are emitted by both natural processes and human activities. GHGs in the atmosphere influence regulation of the Earth's temperature. Emissions from human activities, such as burning fossil fuels for electricity production and vehicle use, have elevated the concentration of these gases in the atmosphere.

Scientific evidence indicates a trend of increasing global temperature over the past century, which a number of scientists attribute to an increase in GHG emissions from human activities. The climate change associated with this global warming is predicted to produce negative economic and social consequences across the globe.

Recent observed changes due to global warming include shrinking glaciers, thawing permafrost, a lengthened growing season, and shifts in plant and animal ranges (IPCC 2007). Generally accepted predictions of long-term environmental impacts due to global warming include sea level rise, changing weather patterns with increases in the severity of storms and droughts, changes to local and regional ecosystems, including the potential loss of species, and a significant reduction in winter snowpack.

The State of California has been at the forefront of developing solutions to address global climate change. Global climate change refers to any significant change in measures of climate, such as average temperature, precipitation, or wind patterns over a period of time. Global climate change may result from natural factors, natural processes, and/or human activities that change the composition of the atmosphere and alter the surface and features of land.

The United Nations Intergovernmental Panel on Climate Change (IPCC) developed several emission trajectories of GHGs needed to stabilize global temperatures and climate change impacts. The IPCC concluded that a stabilization of GHGs at 400 to 450 ppm CO_2 equivalent concentration is required to keep global mean warming below 3.6ºF (2º Celsius [2ºC]), which is assumed to be necessary to avoid dangerous climate change (AEP 2007).

The State of California has been at the forefront of developing solutions to address global climate change. State law defines greenhouse gases as any of the following compounds: CO_2, CH_4, N_2O,

hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6) (California Health and Safety Code Section 38505(g)). CO_2, CH_4, and N_2O are the most common GHGs that result from human activity.

GHG Inventory

The State of California GHG Inventory performed by the CARB, compiled statewide anthropogenic GHG emissions and sinks. It includes estimates for CO2, CH4, N2O, SF6, HFCs, and PFCs. The current inventory covers the years 1990 to 2009, and is summarized in Table 3.2.7-1. Data sources used to calculate this GHG inventory include California and federal agencies, international organizations, and industry associations. The calculation methodologies are consistent with guidance from the IPCC. The 1990 emissions level is the sum total of sources and sinks from all sectors and categories in the inventory. The inventory is divided into seven broad sectors and categories in the inventory. These sectors include: Agriculture; Commercial; Electricity Generation; Forestry; Industrial; Residential; and Transportation.

Total GHG emissions from a source are often reported as a CO2 equivalent (CO2e). The CO2e is calculated by multiplying the emission of each GHG by its global warming potential and adding the results together to produce a single, combined emission rate representing all GHGs. GHG emissions are typically quantified in metric tons (MT) or millions of metric tons (MMT).

TABLE 3.2.7-1 STATE OF CALIFORNIA GHG EMISSIONS BY SECTOR

SECTOR	TOTAL 1990 EMISSIONS (MMT CO_2E)	PERCENT OF TOTAL 1990 EMISSIONS	TOTAL 2009 EMISSIONS (MMT CO_2E)	PERCENT OF TOTAL 2009 EMISSIONS
Agriculture	23.4	5%	32.13	7%
Commercial	14.4	3%	13.41	3%
Electricity Generation	110.6	26%	103.68	23%
Forestry (excluding sinks)	0.2	<1%	0.19	<1%
Industrial	103.0	24%	81.38	18%
Residential	29.7	7%	28.61	6%
Transportation	150.7	35%	172.92	38%
Recycling and Waste			7.32	2%
High Global Warming Potential Gases			16.32	4%
Forestry Sinks	(6.7)		(3.80)	

Source: CARB 2011a.

GHGs have varying global warming potential. The global warming potential is the potential of a gas or aerosol to trap heat in the atmosphere; it is the "cumulative radiative forcing effect of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to a reference gas" (EPA 2006). The global warming potential rating system is standardized to CO2, which has a value of one. For example, CH4 has a global warming potential of 21, which means that it has a global warming effect 21 times greater than CO2 on an equal-mass basis. Table 3.2.7-2 presents the global warming potential and atmospheric lifetimes of common GHGs.

TABLE 3.2.7-2 GLOBAL WARMING POTENTIALS AND ATMOSPHERIC LIFETIMES OF GHGS

GHG	FORMULA	100-YEAR GLOBAL WARMING POTENTIAL	ATMOSPHERIC LIFETIME (YEARS)
Carbon Dioxide	CO_2	1	Variable
Methane	CH_4	21	12 ± 3
Nitrous Oxide	N_2O	310	120
Sulfur Hexafluoride	SF_6	23,900	3,200

Source: EPA 2006.

Human-caused sources of CO2 include combustion of fossil fuels (coal, oil, natural gas, gasoline, and wood). Data from ice cores indicate that CO2 concentrations remained steady prior to the current period for approximately 10,000 years. Concentrations of CO2 have increased in the atmosphere since the industrial revolution.

CH4 is the main component of natural gas and also arises naturally from anaerobic decay of organic matter. Human-caused sources of natural gas include landfills, fermentation of manure, and cattle farming. Human-caused sources of N2O include combustion of fossil fuels and industrial processes such as production of nylon or nitric acid.

Other GHGs are present in trace amounts in the atmosphere and are generated from various industrial or other uses.

Regulatory Setting

On a national scale, federal agencies are addressing emissions of GHGs by reductions mandated in federal laws and Executive Orders; most recently, Executive Order 13423 Strengthening Federal Environmental, Energy, and Transportation Management (January 24, 2007) was enacted. Several states have promulgated laws as a means to reduce statewide levels of GHG emissions. In particular, the California Global Warming Solutions Act of 2006 directs the State of California to reduce statewide GHG emissions to 1990 levels by the year 2020.

Federal

Recent actions by the EPA have allowed for the regulation of GHGs. On April 17, 2009, the EPA issued its proposed endangerment finding for GHG emissions. On December 7, 2009, the EPA Administrator signed and finalized two distinct findings regarding greenhouse gases under Section 202(a) of the Clean Air Act:

> **Endangerment Finding:** The Administrator finds that the current and projected concentrations of the six key well-mixed greenhouse gases—carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6)—in the atmosphere threaten the public health and welfare of current and future generations.
>
> **Cause or Contribute Finding:** The Administrator finds that the combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution which threatens public health and welfare.

These findings do not themselves impose any requirements on industry or other entities. However, this action was a prerequisite to finalizing the EPA's proposed GHG emission standards for light-duty vehicles, which were jointly proposed by the EPA and the Department of Transportation's National Highway Safety Administration on September 15, 2009 and adopted on April 1, 2010. As finalized in April 2010, the emissions standards rule for vehicles will improve average fuel economy standards to 35.5 miles per gallon by 2016. In addition, the rule will require model year 2016 vehicles to meet an estimated combined average emission level of 250 grams of CO_2 per mile.

On March 10, 2009, in response to the FY2008 Consolidated Appropriations Act (H.R. 2764; Public Law 110–161), the EPA proposed a rule that requires mandatory reporting of GHG emissions from large sources in the United States. On September 22, 2009, the Final Mandatory Reporting of Greenhouse Gases Rule was signed, and it was published in the Federal Register on October 30, 2009. The rule became effective on December 29, 2009. The rule will collect accurate and comprehensive emissions data to inform future policy decisions.

The EPA is requiring suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to

the EPA. The gases covered by the proposed rule are CO_2, CH_4, N_2O, HFCs, PFCs, SF_6, and other fluorinated gases, including nitrogen trifluoride (NF_3) and hydrofluorinated ethers (HFE).

State

The State of California enacted some of the first legislation in the United States to regulate GHGs. The following subsections describe regulations and standards that have been adopted by the State of California to address GHG emissions.

Assembly Bill 32, the California Global Warming Solutions Act of 2006

In September 2006, Governor Schwarzenegger signed Assembly Bill (AB) 32 into law. AB 32 required that, by January 1, 2008, the CARB determine what the statewide GHG emissions level was in 1990, and approve a statewide GHG emissions limit that is equivalent to that level, to be achieved by 2020. The CARB adopted its Scoping Plan, which provided estimates of the 1990 GHG emissions level and identified sectors for the reduction of GHG emissions, in December 2008. The CARB has estimated that the 1990 GHG emissions level was 427 MMT net CO_2e (CARB 2007). The CARB estimates that a reduction of 173 MMT net CO_2e emissions below business-as-usual would be required by 2020 to meet the 1990 levels (CARB 2007). This amounts to roughly a 30 percent reduction from projected business-as-usual levels in 2020 (CARB 2008).

Senate Bill 97

Senate Bill (SB) 97, enacted in 2007, amends the CEQA statute to clearly establish that GHG emissions and the effects of GHG emissions are appropriate subjects for CEQA analysis. SB 97 directed the Governor's Office of Planning and Research to develop draft CEQA guidelines "for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions" by July 1, 2009, and directed the California Natural Resources Agency to certify and adopt the CEQA guidelines by January 1, 2010.

The Office of Planning and Research published a technical advisory on CEQA and climate change on June 19, 2008. The guidance did not include a suggested threshold, but stated that the Office of Planning and Research had asked the CARB to "recommend a method for setting thresholds which will encourage consistency and uniformity in the CEQA analysis of greenhouse gas emissions throughout the state." The Office of Planning and Research technical advisory does recommend that CEQA analyses include the following components:

- identification of greenhouse gas emissions;
- determination of significance; and
- mitigation of impacts, as needed and as feasible.

On December 31, 2009, the California Natural Resources Agency adopted the proposed amendments to the CEQA Guidelines. These amendments became effective on March 18, 2010.

Executive Order S-3-05

Executive Order S-3-05, signed by Governor Schwarzenegger on June 1, 2005, calls for a reduction in GHG emissions to 1990 levels by 2020 and for an 80 percent reduction in GHG emissions below 1990 levels by 2050. Executive Order S-3-05 also calls for the California EPA to prepare biennial science reports on the potential impact of continued global climate change on certain sectors of the California economy. The first of these reports, "Our Changing Climate: Assessing Risks to California," and its supporting document, "Scenarios of Climate Change in California: An Overview," were published by the California Climate Change Center in 2006.

Executive Order S-21-09

Executive Order S-21-09 was enacted by the Governor on September 15, 2009. Executive Order S-21-09 requires that the CARB, under its AB 32 authority, adopt a regulation by July 31, 2010 that sets a 33 percent renewable energy target. Under Executive Order S-21-09, the CARB will work with the Public Utilities Commission and California Energy Commission to encourage the creation and use of renewable energy sources, and will regulate all California utilities. The CARB will also consult with the Independent System Operator and other load balancing authorities on the impacts on reliability, renewable integration requirements, and interactions with wholesale power markets in carrying out the provisions of the Executive Order. The order requires the CARB to establish highest priority for those resources that provide the greatest environmental benefits with the least environmental costs and impacts on public health.

California Code of Regulations Title 24

Although not originally intended to reduce GHG emissions, Title 24 of the California Code of Regulations, Part 6: California's Energy Efficiency Standards for Residential and Nonresidential Buildings, was first established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow for the consideration and possible incorporation of new energy efficiency technologies and methods. Energy efficient buildings require less electricity, natural gas, and other fuels. Electricity production from fossil fuels and on-site fuel combustion (typically for water heating) results in GHG emissions. Therefore, increased energy efficiency results in decreased GHG emissions.

The GHG emission inventory was based on Title 24 standards as of October 2005; however, Title 24 has been updated as of 2008 and standards are currently being phased in.

Senate Bill 1078, Senate Bill 107, and Executive Order S-14-08

SB 1078 initially set a target of 20 percent of energy to be sold from renewable sources by the year 2017. The schedule for implementation of the renewable portfolio standard (RPS) was accelerated in 2006 with the Governor's signing of SB 107, which accelerated the 20 percent RPS goal from 2017 to 2010. On November 17, 2008, the Governor signed Executive Order S-14-08, which establishes a goal of having all retail sellers of electricity to serve 33 percent of their load with renewable energy by 2020. The Governor signed Executive Order S-21-09 on September 15, 2009, which directs the CARB to implement a regulation consistent with the 2020 33 percent renewable energy target by July 31, 2010.

State Standards Addressing Vehicular Emissions

California Assembly Bill 1493 (Pavley), enacted on July 22, 2002, required the CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Regulations adopted by the CARB would apply to 2009 and later model year vehicles. The CARB estimated that the regulation would reduce climate change emissions from light duty passenger vehicle fleet by an estimated 18 percent in 2020 and by 27 percent in 2030 (AEP 2007). Overall within the state of California, implementation of the Pavley standards are anticipated to reduce GHG emissions by 17.23 percent (CARB 2011).

The CARB has adopted amendments to the Pavley regulations that reduce GHG emissions in new passenger vehicles from 2009 through 2016. The amendments, approved by the CARB Board on September 24, 2009, are part of California's commitment toward a nationwide program to reduce new passenger vehicle GHGs from 2012 through 2016, and prepare California to harmonize its rules with the federal rules for passenger vehicles.

Executive Order S-01-07

Executive Order S-01-07 was enacted by the Governor on January 18, 2007, and mandates that: 1) a statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least

AR062469

10 percent by 2020; and 2) a Low Carbon Fuel Standard for transportation fuels be established for California. On April 23, 2009, the CARB adopted regulations to implement the Low Carbon Fuel Standard.

Senate Bill 375

SB 375 finds that GHG from autos and light trucks can be substantially reduced by new vehicle technology, but even so, "…it will be necessary to achieve significant additional greenhouse gas reductions from changed land use patterns and improved transportation. Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32." Therefore, SB 375 requires that regions with metropolitan planning organizations adopt sustainable community strategies, as part of their regional transportation plans, which are designed to achieve certain goals for the reduction of GHG emissions from mobile sources.

Local

To date, the MDAQMD has not enacted regulations governing GHGs. Likewise, Riverside County and the City of Blythe have not adopted policies or regulations addressing greenhouse gas emissions or climate change.

3.2.8 Hazards and Hazardous Materials

This section describes the environmental setting and regulatory framework in regards to hazards and hazardous materials for the proposed Project and Alternatives. The affected environment for public health and safety includes evaluation of several program areas, including aircraft operations, hazardous materials, public health, and electric and magnetic field exposure (EMF). The affected environment related to flooding or seismic hazards is discussed in Section 3.2.7, *Geology and Soils* and Section 3.2.10, *Hydrology and Water Quality*.

Environmental Setting

A consideration for hazardous materials analyses is the proximity of residential and other sensitive receptors, such as schools, daycare centers, emergency response facilities, and long-term care facilities. The Project's solar array field and gen-tie line would be located within Riverside County and portions of the proposed site would be located within the City of Blythe.

There are 369 residences within one mile of the solar facility site. The three existing residences (two residences on APN 863060015 and one residence on APN 863100016) on the solar facility site would be removed as part of the Project and therefore would not be considered sensitive receptors of the Project. Seven individual residences are located within 1,000 feet of the solar facility site. The closest residence (APN 824110004) is approximately 260 feet away from the property boundary and adjacent to an area of the Project that is proposed to contain solar arrays. In addition, the Project is approximately 0.4 mile (2,200 feet) from the Mesa Verde Park and approximately 0.8 mile (4,400 feet) from the Roy Wilson Community and Child Center. Outside the solar facility site boundary, the closest occupied residence to the Project's proposed gen-tie line is approximately 0.7 mile (3,670 feet); the closest unoccupied mobile home is approximately 0.4 mile (1,960 feet). No schools, hospitals, or long-term care facilities are located within one mile of the proposed Project.

Environmental Site Assessment

Environmental Data Resources, Inc. (EDR) prepared the EDR DataMap™ Area Study, which contains a summary of environmentally affected sites and other sites that are within a one-mile radius surrounding the Project area (refer to Appendix F). The EDR report includes descriptions of each agency database, site names and addresses, and status, with some repetition existing among the different databases. Figure 3.2.8-1 illustrates the location of hazardous sites.

Federal Database Records

The following provides discussion of the federal databases reviewed in the EDR.

Comprehensive Environmental Response Compensation Liability Information System (CERCLIS) and No Further Remedial Action Planned Report (CERC-NFRAP)

CERC-NFRAP contains information on archived sites that have been removed from the inventory of CERCLIS sites. CERCLIS contains information on sites identified by the EPA as abandoned, inactive, or uncontrolled hazardous waste sites that may require cleanup. CERCLIS sites are in the evaluation stage to determine whether these sites are to be included on the federal NPL (priority for clean up under the Superfund program). Archived status indicates that, to the best of the EPA's knowledge, assessment has been completed and the EPA has determined no further steps will be taken to list the site on the NPL, unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time.

The EDR database indicates no sites are listed within the Project area; however, two sites within the one-mile search radius of the Project area do appear on the CERC-NFRAP list:

- Farmer Air Service, 17500 W. Hobson Way, Blythe.
- West Coast Flying Service, 13-400 W. 14th Save, Blythe.

Resource Conservation and Recovery Act (RCRA) and Corrective Action (CORRACTS) List

The CORRACTS list contains information concerning RCRA facilities that have conducted or are currently conducting corrective action. The EDR database indicates that no sites are listed within the Project area; however, two sites appear on the RCRA and the CORRACTS list as located within one mile of the solar facility site:

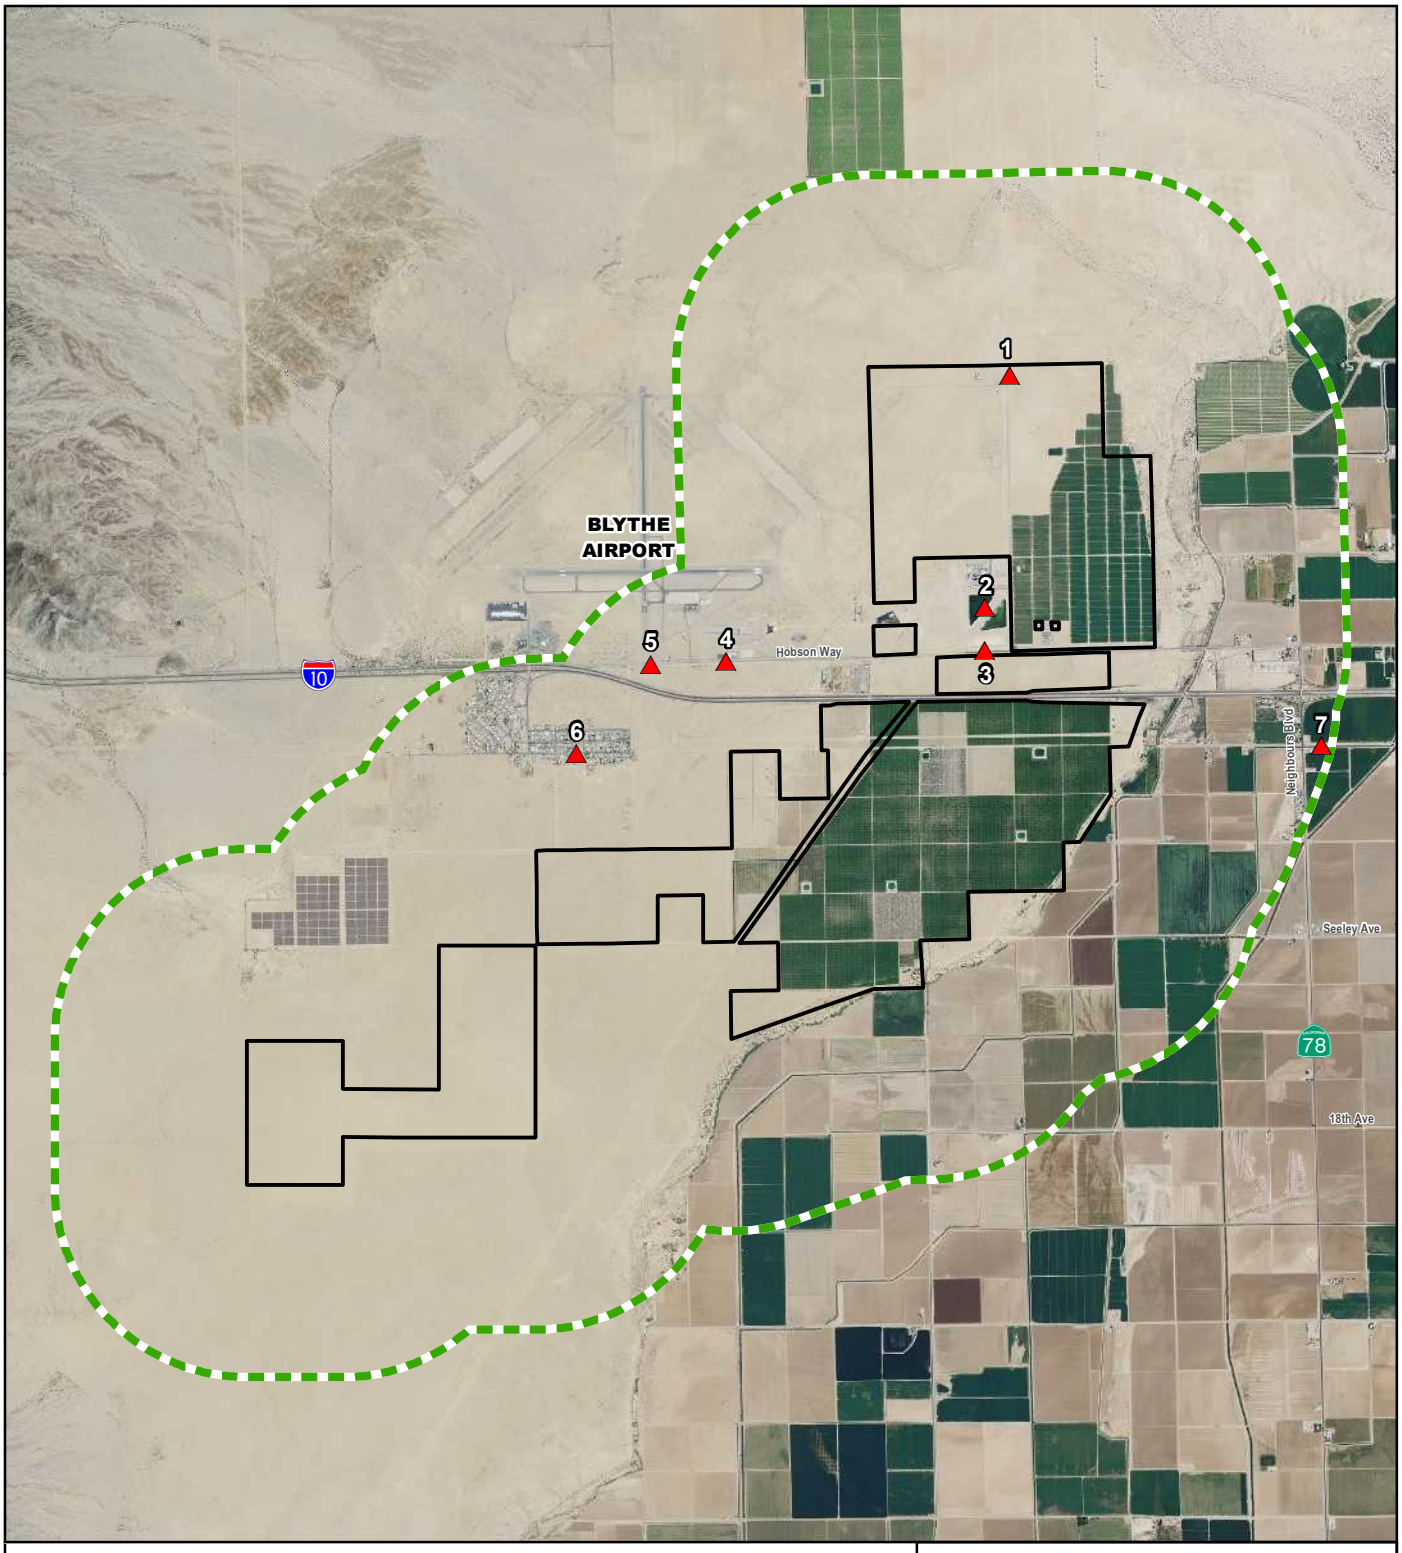
- Farmer Air Service, 17500 W. Hobson Way, Blythe.
- West Coast Flying Service, 13-400 W. 14th Ave., Blythe.

RCRA and Non-Generators (NonGen)

The RCRA-NonGen is an EPA comprehensive information system, providing access to data supporting the RCRA of 1976 and the Hazardous and Solid Waste Amendments of 1984. The database includes selective information on sites that generate, transport, store, treat, and/or dispose of hazardous waste as defined by the RCRA. Non-Generators do not presently generate hazardous waste.

The EDR database indicates that no sites are listed within the Project area; however, two sites appear on the RCRA-NonGen list as located within the one-mile search radius of the Project area:

- Farmer Air Service, 17500 W. Hobson Way, Blythe.
- West Coast Flying Service, 13-400 W. 14th Ave., Blythe.



The Facility Index System (FINDS)

The FINDS contains both facility information and "pointers" to other sources of information that contain more detail. The EDR database indicates that no sites are listed within the Project area; however, two sites appear on the FINDS list as located within the one-mile search radius of the Project area:

- Farmer Air Service, 17500 W. Hobson Way, Blythe.
- West Coast Flying Service, 13-400 W. 14th Ave., Blythe.

State and Local Database Records

The following provides discussion of the State and local data bases reviewed in the EDR.

HAZARDOUS SITES

BLYTHE MESA SOLAR PROJECT

POWER ENGINEERS | RENEWABLE RESOURCES GROUP

THIS PAGE INTENTIONALLY LEFT BLANK

The Waste Management Unit Database System/Solid Waste Assessment Test (WMUDS/SWAT)

WMUDS/SWAT is used for program tracking and inventory of waste management units. The EDR database indicates that no sites are listed within the Project area; however, one site appears on the FINDS list, located within the one-mile search radius of the Project area:

- Blythe Airport Dump, Blythe Airport.

Hazardous Waste and Substances Sites (HIST CORTESE)

The HIST CORTESE list identifies sites designated by the State Water Resources Control Board, integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (CALSITES) as those that have had documented leaking underground storage tanks. The EDR database indicates that two sites are listed within the Project area and one site is listed on the CORTESE database as located within the one-mile search radius of the Project area.

On-Site:

- Sunworld #1: 15550 West Hobson Way, Blythe. The EDR indicates this is a leaking underground storage tank (LUST) clean-up site with the status as Completed – Case Closed.
- Blythe Lemon Ranch #41: 15550 West Hobson Way, Blythe.

Off-site:

- Blythe Airport: 17240 Blythe Airport, Blythe. The EDR indicates this is a LUST clean-up site with the status as Completed – Case Closed.

Leaking Underground Storage Tank (LUST)

The LUST database tracks all of the known leaking underground storage tanks. The database also provides some information on the status of the remedial action on those sites. The EDR database indicates three sites listed on the LUST database within the Project area, and one within the one-mile search radius of the Project area. The locations are as follows:

On-Site:

- Sunworld #1: 15550 West Hobson Way, Blythe. The EDR indicates this is a LUST clean-up site with the status as Completed – Case Closed.
- Sunworld: 15550 West Hobson Way, Blythe. The EDR indicates the status of this listing as Site Closed 10/23/93 – Case referred to the Regional Water Board.
- Sunworld Facility: The EDR indicates this is a LUST clean-up site with the status as Completed – Case Closed.

Off-Site:

- Blythe Airport: 17240 Blythe Airport, Blythe. The EDR indicates this is a LUST clean-up site with the status as Completed – Case Closed.

Spills, Leaks, Investigation and Cleanup (SLIC)

SLIC database (has been replaced by Geotracker) is the California Regional Water Quality Control Board's data management system for managing sites that impact groundwater, especially those that require groundwater cleanup (Underground Storage Tanks [USTs], Department of Defense, Site Cleanup Program) as well as permitted facilities such as operating USTs and land disposal sites The EDR database revealed that there is one SLIC site within the one-mile search radius (not located on the Project area):

- Woten Aviation, Blythe AFSFO: 17798 Blythe Way, Blythe.

Historical Underground Storage Tank (HIST UST)

The HIST UST is a database of historical listings of underground storage tanks. The EDR database revealed that there is one HIST UST site within the one-mile search radius (not located on the Project area):

- Blythe RCAG, Blythe AFSFO.

California Hazardous Material Incident Report System (CHMIRS)

CHMIRS contains information on reported hazardous material (e.g., accidental releases of spills). The EDR database revealed that there is one CHMIRS site within the one-mile search radius (not located on the Project area):

- Blythe Airport Dump, Blythe Airport.

Aboveground Storage Tank (AST)

The AST database contains registered ASTs. The data comes from the State Water Resources Control Board's Hazardous Substance Storage Container Database. The EDR database revealed that there is one 3,500 gallon AST registered on the Project area:

- Blythe Lemon Ranch, 10151 Buck Blvd., Blythe (referenced as Listed Site #1 on Figure 3.2.8-1).

Airport Operations

The Blythe Airport is to the north and west of the proposed solar facility site. The 8.4 miles of gen-tie line would be located to the west and south of the Blythe Airport. The airport is a public facility, owned by Riverside County. The 3,094-acre facility is the largest airport serving eastern Riverside County and serves primarily general aviation demand in the Blythe area. The Airport is classified in the National Plan of Integrated Airport Systems as a general aviation transport airport, designed to accommodate business jets, cargo-type aircraft, light private planes, and flight school training activities. The Blythe Airport currently has two runways (8/26 and 17/35). The primary runway is Runway 8/26, which is oriented generally east-west. Aircraft operations average 69 flights per day (AirNav 2012). The airport is often used as a base for crop spraying operations, flight rental, and flight instruction (County of Riverside 2003-2008).

The proposed Project would be located within the area covered by the Riverside County Airport Land Use Compatibility Plan (RCALUCP), which was adopted by the Riverside County Airport Land Use Commission (ALUC) in 2004 and replaced the compatibility plans for individual airports. The RCALUCP identifies Airport Influence Areas (AIAs) to protect the public from the adverse effects of aircraft noise, ensure that facilities and people are not concentrated in areas susceptible to aircraft accidents, and ensure that no structures or activities adversely affect or encroach upon the use of navigable airspace (ALUC 2012).

The proposed Project would be located within the Blythe AIA. According to the RCALUCP (Appendix D, Compatibility Guidelines for Specific Land Uses), electrical facilities (such as power plants, electrical substations, and transmission lines) located in airport land use compatibility zones must meet the restrictions designated for each zone so that they are generally compatible or potentially compatible. This is to ensure that electrical facilities do not create obstructions to the navigable air space and safe operations at the airport. Land uses, concentrations of population, and height of proposed development within this airport influence area are restricted in certain areas of the AIA and listed in Table 3.3.8-2 under the RCALUCP discussion. Airport land use compatibility zones within the Project area are illustrated in Figure 3.2.8-2.

The proposed Project would fall within airport Compatibility Zones B1, C, D, and E. The majority of the proposed Project's PV panel structures would be located within Zones D and E, with a smaller portion located within Zone C; no solar panels are proposed in Zone B1. A portion of the solar array field would be partially outside of the Blythe AIA. The gen-tie lines (poles would be approximately 85 to 120 feet in height) would traverse Zones D and E, and would proceed generally from I-10 in a southwesterly direction and then in a westerly direction, ultimately terminating at the planned Colorado River Substation located outside the Blythe AIA.

Table 3.3.8-2 below lists the approximate tower heights by voltage for existing and planned transmission lines within Blythe AIA.

TABLE 3.3.8-2 APPROXIMATE TOWER HEIGHTS FOR TRANSMISSION LINES IN THE BLYTHE AIA

TRANSMISSION LINE VOLTAGE	APPROXIMATE TOWER HEIGHT
Planned 500 kV	125 to 200 feet
Existing 220 kV/230 kV	75 to 135 feet
Planned Blythe Mesa Solar Project 230 kV	85 to 125 feet
Existing 161 kV	60 to 80 feet
Existing 138 kV	60 to 80 feet

Source: POWER, LIDAR data from Blythe 230 kV Transmission Line and Devers-Palo Verde No. 2 Transmission Project Final EIR/EIS

Electric and Magnetic Fields

EMFs are invisible lines of force that surround any electrical device. Both fields occur together whenever electricity flows, hence the general practice of describing exposure together as EMF exposure. Electric fields are produced by voltage and increase in strength as the voltage increases. Magnetic fields result from the flow of current through wires or electrical devices and increase in strength as the current increases. Most electrical equipment has to be turned on, i.e., current must be flowing, for a magnetic field to be produced. Electric fields, on the other hand, are present even when the equipment is switched off, as long as it remains connected to the source of electric power. Both electric and magnetic fields decrease as the distance from the source increases.

Regulatory Setting

Federal

Resource Conservation and Recovery Act of 1976 (42 U.S.C. § 6901 et seq.)

The RCRA grants authority to the EPA to control hazardous waste from start to finish. This covers the production, transportation, treatment, storage, and disposal of hazardous waste. The RCRA also sets forth a framework for the management of non-hazardous solid waste. The 1986 amendments to the RCRA enabled the EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances.

Federal Water Pollution Control Act (Clean Water Act)

The CWA is a comprehensive statute focused on restoring and maintaining the chemical, physical, and biological integrity of the nation's waters. Originally enacted in 1948, the CWA was amended numerous times until it was reorganized and expanded in 1972. It continues to be amended almost on an annual basis.

Primary authority for the implementation and enforcement of the CWA rests with the EPA. The CWA authorizes water quality programs, requires federal effluent limitations and state water quality standards, requires permits for the discharge of pollutants into navigable waters, provides enforcement mechanisms, and authorizes funding for wastewater treatment works construction grants and state revolving loan

programs, as well as funding to states and Tribes for their water quality programs. Provisions have also been added to address water quality problems in specific regions and specific waterways. The Project would be subject to a National Pollutant Discharge Elimination System (NPDES) Construction General Permit during construction and a General Industrial Permit during operations and maintenance to address water quality.

Occupational Safety and Health Act

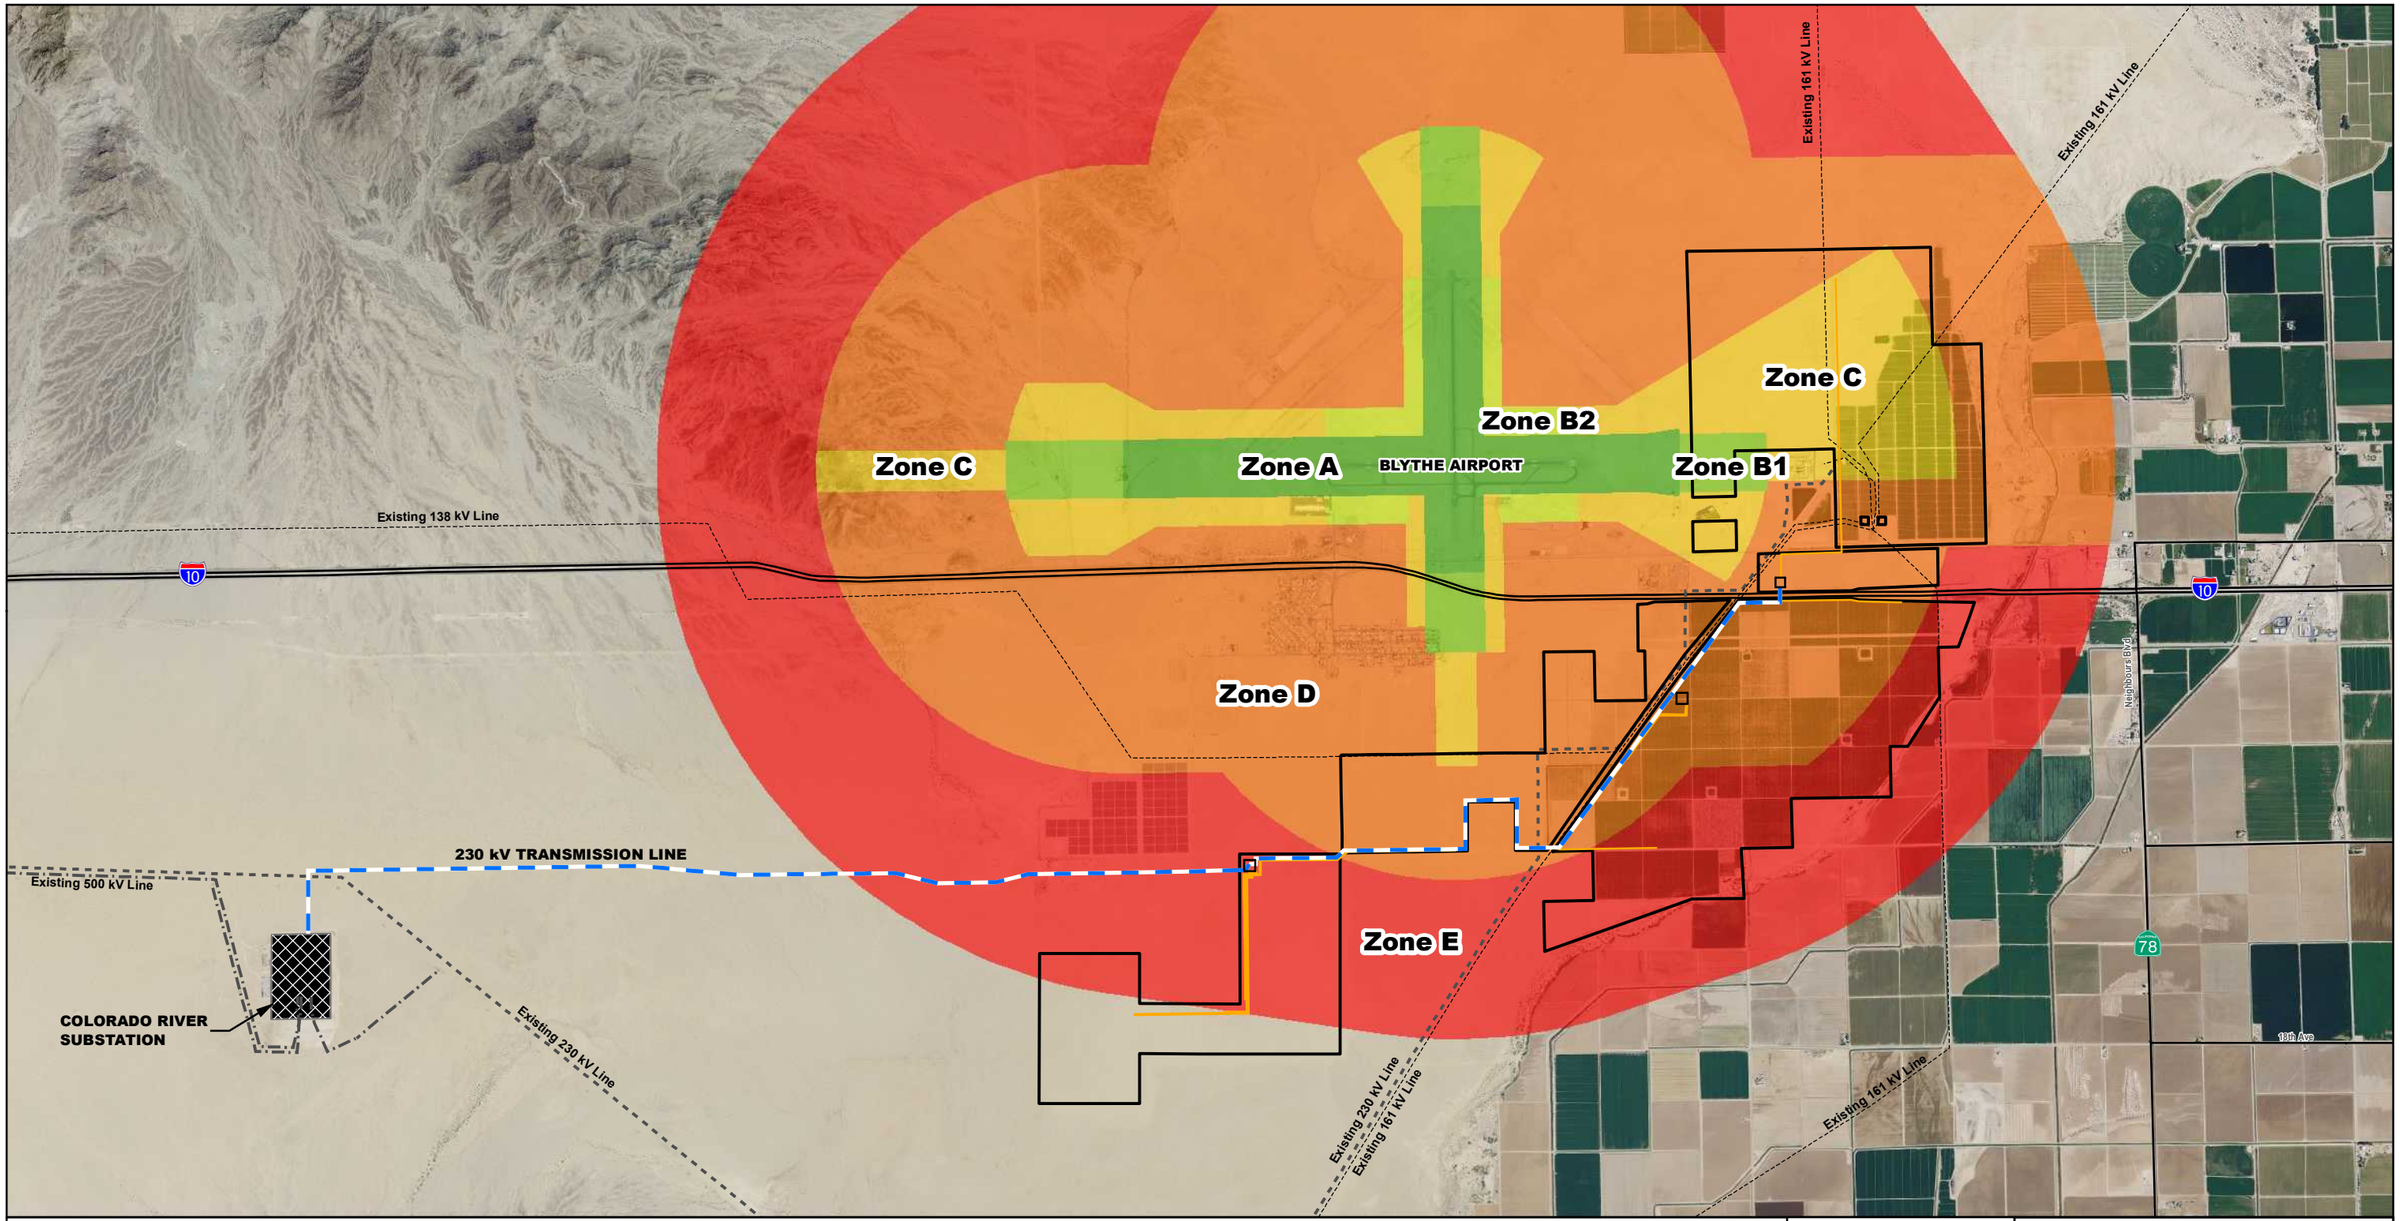
Congress passed the Occupational Safety and Health Act (OSHA) to ensure safe and healthful working conditions for working men and women. OSHA authorized enforcement of the standards developed under the Act and assisted states in their efforts to ensure safe and healthful working conditions. OSHA also provides for research, information, education, and training in the field of occupational safety and health. The Project would be subject to OSHA requirements during construction, operations and maintenance, and decommissioning.

Federal Aviation Administration Regulations Part 77

Federal Aviation Administration (FAA) regulations, 14 CFR Part 77, establish standards and notification requirements for objects affecting navigable airspace. This notification serves as the basis for evaluating the effects of construction or alteration on operating procedures; determining the potential hazardous effect of the proposed construction on air navigation; identifying mitigation measures to enhance safe air navigation; and charting of new objects.

These regulations apply to the following:

- Any construction or alteration exceeding 200 feet above ground level;
- Any construction or alteration:



- within 20,000 feet of a public use or military airport that exceeds a 100:1 surface from any point on the runway of each airport with at least one runway more than 3,200 feet long
- within 10,000 feet of a public use or military airport that exceeds a 50:1 surface from any point on the runway of each airport with its longest runway no more than 3,200 feet long
- within 5,000 feet of a public use heliport that exceeds a 25:1 surface;
- Any highway, railroad or other traverse way whose prescribed adjusted height would exceed the above-noted standards:
- when requested by the FAA; and
- any construction or alteration located on a public use airport or heliport regardless of height or location.

FAA Advisory Circular No. 70/7460-1G

FAA Advisory Circular No. 70/7460-1G, “Proposed Construction and/or Alteration of Objects that May Affect the Navigation Space,” identifies the need to file the “Notice of Proposed Construction or Alteration” form (Form 7640) with the FAA in cases of potential for an obstruction hazard. The proposed Project includes towers to support the gen-tie line that could be between 85 and 125 feet in height.

Title 47 CFR Part 15.2524, Federal Communications Commission

Title 47 CFR Part 15.2524, Federal Communications Commission (FCC) prohibits operation of devices that can interfere with radio-frequency communication. The proposed gen-tie line, as a high-voltage gen-tie line, represents a potential source of radio-frequency communication interference.

THIS PAGE INTENTIONALLY LEFT BLANK

State

California Environmental Protection Agency

The California Environmental Protection Agency (Cal EPA) and the State Water Resources Control Board establish rules governing the use of hazardous materials and the management of hazardous waste. Applicable State and local laws include the following:

- Public Safety/Fire Regulations/Building Codes
- Hazardous Waste Control Law
- Hazardous Substances Information and Training Act
- Air Toxics Hot Spots and Emissions Inventory Law
- Underground Storage of Hazardous Substances Act
- Porter-Cologne Water Quality Control Act

Department of Toxic Substances Control

The Department of Toxic Substances Control (DTSC) has primary regulatory responsibility for the management of hazardous materials and the generation, transport, and disposal of hazardous waste under the authority of the Hazardous Waste Control Law. Enforcement is delegated to local jurisdictions that enter into agreements with the DTSC.

California's Secretary of Environmental Protection established a unified hazardous waste and hazardous materials management regulatory program as required by Health and Safety Code Chapter 6.11. The unified program consolidates, coordinates, and makes consistent portions of the following six existing programs:

- Hazardous Waste Generations and Hazardous Waste On-site Treatment
- Underground Storage Tanks
- Hazardous Material Release Response Plans and Inventories
- California Accidental Release Prevention Program
- Aboveground Storage Tanks (spill control and countermeasure plan only)
- Uniform Fire Code Hazardous Material Management Plans and Inventories

The statute requires all counties to apply to the Cal EPA Secretary for the certification of a local unified program agency. Qualified cities are also permitted to apply for certification. The local Certified Unified Program Agency (CUPA) is required to consolidate, coordinate, and make consistent the administrative requirements, permits, fee structures, and inspection and enforcement activities for these six program elements within the county. Most CUPAs have been established as a function of a local environmental health or fire department.

The Office of the State Fire Marshal participates in all levels of the CUPA program including regulatory oversight, CUPA certifications, evaluations of the approved CUPAs, training, and education. The Riverside County Department of Environmental Health serves as the CUPA in Riverside County.

Hazardous Waste Control Act

The Hazardous Waste Control Act created the State hazardous waste management program, which is similar to but more stringent than the federal RCRA program. The act is implemented by regulations contained in Title 26 of the CCR, which describes the following required aspects for the proper management of hazardous waste:

- identification and classification;
- generation and transportation;
- design and permitting of recycling, treatment, storage, and disposal facilities;

- treatment standards;
- operation of facilities and staff training; and
- closure of facilities and liability requirements.

These regulations list more than 800 materials that may be hazardous and establish criteria for identifying, packaging, and disposing of such waste. Under the Hazardous Waste Control Act and Title 26, the generator of hazardous waste must complete a manifest that accompanies the waste from generator to transporter to the ultimate disposal location. Copies of the manifest must be filed with the DTSC.

California Occupational Safety and Health Administration

The California Occupational Safety and Health Administration (Cal/OSHA) is the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. Cal/OSHA standards are generally more stringent than federal regulations. The employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR 337-340). The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and hazardous substance exposure warnings.

Title 8, California Code of Regulations, Section 2700 et seq. "High Voltage Safety Orders"

Title 8 of the CCR specifies requirements and minimum standards for safety when installing, operating, working around, and maintaining electrical installations and equipment. The proposed Project would be subject to Title 8.

National Electrical Safety Code

The National Electrical Safety Code specifies grounding procedures to limit nuisance shocks and specifies minimum conductor ground clearances. The proposed Project would be subject to this code and would be designed with a grounding system providing an adequate path to ground to permit the dissipation of current created by lightning and ground faults.

14 California Code of Regulations, Sections 1250 – 1258, "Fire Prevention Standards for Electric Utilities"

14 CCR provides specific exemptions from electric pole and tower firebreak. 14 CCR also provides conductor clearance standards and specifies when and where standards apply. These standards address hazards that could be caused by sparks from conductors of overhead lines, or that could result from direct contact between the line and combustible objects. The proposed Project would be subject to these standards.

Local

Riverside County General Plan

The Riverside County General Plan Safety Element provides policies for development of the Project area within Riverside County. In compliance with State law, the primary objective of the Safety Element is to "reduce death, injuries, property damage, and economic and social impact from hazards." Countywide policies that address health and safety within the County boundaries are also located in the Land Use Element of the County General Plan.

Safety Element (S)

Fire Hazards – Building Code and Performance Standards

Policy S 1.1. *Mitigate hazard impacts through adoption and strict enforcement of current building codes, which will be amended as necessary when local deficiencies are identified.*

Policy S 5.1. *Develop and enforce construction and design standards that ensure that proposed development incorporates fire prevention features through the following:*

1) *All proposed construction shall meet minimum standards for fire safety as defined in the County Building or Fire Codes, or by County zoning, or as dictated by the Building Official or the Transportation Land Management Agency based on building type, design, occupancy, and use.*
2) *In addition to the standards and guidelines of the Uniform Building Code and Uniform Fire Code fire safety provisions, continue additional standards for high-risk, high occupancy, dependent, and essential facilities where appropriate under the Riverside County Fire Protection Ordinance. These shall include assurance that structural and nonstructural architectural elements of the building will not:*

    - impede emergency egress for fire safety staffing/personnel, equipment, and apparatus; nor
    - hinder evacuation from fire, including potential blockage of stairways or fire doors.

3) *Proposed development in Hazardous Fire areas shall provide secondary public access, unless determined otherwise by the County Fire Chief.*
4) *Proposed development in Hazardous Fire areas shall use single loaded roads to enhance fuel modification areas, unless otherwise determined by the County Fire Chief.*

Hazardous Waste and Materials – Hazardous Waste Management Plan

Policy S 6.1. *Enforce the policies and siting criteria and implement the programs identified in the County of Riverside Hazardous Waste Management plan, which includes the following: (AI 98)*

1) *Comply with federal and state laws pertaining to the management of hazardous wastes and materials.*
2) *Ensure active public participation in hazardous waste and hazardous materials management decisions in Riverside County.*
3) *Coordinate hazardous waste facility responsibilities on a regional basis through the Southern California Hazardous Waste Management Authority (SCHWMA).*
4) *Encourage and promote the programs, practices, and recommendations contained in the County Hazardous Waste Management Plan, giving the highest waste management priority to the reduction of hazardous waste at its source.*

Policy S 7.2. *Require commercial businesses, utilities, and industrial facilities that handle hazardous materials to:*

- Install automatic fire and hazardous materials detection, reporting and shut-off devices; and
- Install an alternative communication system in the event power is out or telephone service is saturated following an earthquake.

Land Use Element (LU)

Policy LU 6.2(b). *The location of the proposed use will not jeopardize public health, safety, and welfare, or the facility is necessary to ensure the continual public safety and welfare.*

Policy LU 14.7. *Ensure that no structures or activities encroach upon or adversely affect the use of navigable airspace.*

Palo Verde Valley Area Plan

PVVAP 14.1. *Protect life and property from wildfire hazards through adherence to the Fire Hazards section of the General Plan Safety Element.*

Riverside County Airport Land Use Compatibility Plan

The proposed Project would be located within the area covered by the RCALUCP. The RCALUCP sets forth the criteria and policies that the Riverside County ALUC uses in assessing the compatibility between the principal airports in Riverside County and proposed land use development in the areas surrounding them. The RCALUCP primarily deals with review of local general plans, specific plans, zoning ordinances, and other land use documents covering broad geographic areas. Certain individual land use development proposals also may be reviewed by the ALUC as provided in the policies identified in the RCALUCP. The ALUC does not have authority over existing incompatible land uses or the operation of any airport.

The ALUC adopts Airport Land Use Compatibility Plans for the areas surrounding the airports within its jurisdiction. Local development approvals must be found consistent with the RCALUCP unless approved by a 4/5th supermajority vote. The RCALUCP identifies AIAs to protect the public from the adverse effects of aircraft noise, ensure that facilities and people are not concentrated in areas susceptible to aircraft accidents, and ensure that no structures or activities adversely affect or encroach upon the use of navigable airspace (ALUC 2012). The Compatibility Plan for Blythe Airport is based upon the Airport Master Plan adopted by the Riverside County Board of Supervisors in 2001.

The following RCALUCP county-wide policies are applicable to the proposed Project:

Policy 1.5.3. Major Land Use Actions: The scope or character of certain major land use actions, as listed below, is such that their compatibility with airport activity is a potential concern. Even though these actions may be basically consistent with the local general plan or specific plan, sufficient detail may not be known to enable a full airport compatibility evaluation at the time that the general plan or specific plan is reviewed. To enable better assessment of compliance with the compatibility criteria set forth herein, ALUC review of these actions may be warranted. The circumstances under which ALUC review of these actions is to be conducted are indicated in Policy 1.5.2 above.

1) Actions affecting land uses within any compatibility zone.

   Any proposed expansion of the sphere of influence of a city or special district.
   Proposed pre-zoning associated with future annexation of land to a city.
   Proposed development agreements or amendments to such agreements.
   Proposed residential development, including land divisions, consisting of five or more dwelling units or lots.
   Any discretionary development proposal for projects having a building floor area of 20,000 square feet or greater unless only ministerial approval (e.g., a building permit) is required.
   Major capital improvements (e.g., water, sewer, or roads) which would promote urban uses in undeveloped or agricultural areas to the extent that such uses are not reflected in a previously reviewed general plan or specific plan.
   Proposed land acquisition by a government entity for any facility accommodating a congregation of people (for example, a school or hospital).
   Any off-airport, non-aviation use of land within Compatibility Zone A of any airport.
   Proposals for new development (including buildings, antennas, and other structures) having a height of more than:

   - 35 feet within Compatibility Zone B1, B2, or a Height Review Overlay Zone;
   - 70 feet within Compatibility Zone C; or

- 150 feet within Compatibility Zone D or E.

Any obstruction reviewed by the Federal Aviation Administration in accordance with Part 77 of the Federal Aviation Regulations that receives a finding of anything other than "not a hazard to air navigation."

Any project having the potential to create electrical or visual hazards to aircraft in flight, including:

- Electrical interference with radio communications or navigational signals;
- Lighting which could be mistaken for airport lighting;
- Glare in the eyes of pilots of aircraft using the airport; and
- Impaired visibility near the airport.

Projects having the potential to cause attraction of birds or other wildlife that can be hazardous to aircraft operations to be increased within the vicinity of an airport.

2) Proposed non-aviation development of airport property if such development has not previously been included in an airport master plan or community general plan reviewed by the Commission. (See Policy 1.2.5 for definition of aviation-related use.)
3) Regardless of location within Riverside County, any proposal for construction or alteration of a structure (including antennas) taller than 200 feet above the ground level at the site. (Such structures also require notification to the Federal Aviation Administration in accordance with Federal Aviation Regulations, Part 77, Paragraph 77.13(a) (1).)
4) Any other proposed land use action, as determined by the local planning agency, involving a question of compatibility with airport activities.

Policy 3.1.4. *Nonresidential Development: The compatibility of nonresidential development shall be assessed primarily with respect to its usage intensity (the number of people per acre) and the noise-sensitivity of the use. Additional criteria listed in Table 2A shall also apply.*

1) The total number of people permitted on a project site at any time, except for rare special events, must not exceed the indicated usage intensity times the gross acreage of the site.

Usage intensity calculations shall include all people (e.g., employees, customers/ visitors, etc.) who may be on the property at any single point in time, whether indoors or outside.

Rare special events are ones (such as an air show at an airport) for which a facility is not designed and normally not used and for which extra safety precautions can be taken as appropriate.

No single acre of a project site shall exceed the number of people per acre indicated in Policy 4.2.5(b) and listed in Table 2A unless special risk reduction building design measures are taken as described in Policy 4.2.6.

The noise exposure limitations cited in Policy 4.1.4 and listed in Table 2B shall be the basis for assessing the acceptability of proposed nonresidential land uses relative to noise impacts. The ability of buildings to satisfy the interior noise level criteria noted in Policy 4.1.6 shall also be considered.

Policy 3.1.5. *Prohibited Uses: Regardless of usage intensity, certain types of uses are deemed unacceptable within portions of an airport influence area. See Policy 4.2.3 and Table 2A. In addition to these explicitly prohibited uses, other uses will normally not be permitted in the respective compatibility zones because they do not meet the usage intensity criteria.*

TABLE 3.3.8-1 BASIC COMPATIBILITY CRITERIA

ZONE	LOCATIONS	MAXIMUM DENSITIES/INTENSITIES (PEOPLE PER ACRE)[1]		REQUIRED OPEN LAND[4]	PROHIBITED USES[5]	OTHER DEVELOPMENT CONDITIONS[6]
		Average[2]	Single Acre[3]			
B1	Inner Approach/Departure Zone	25	50	30%	• Children's schools, day care centers, libraries • Hospitals, nursing homes • Places of worship • Buildings with >2 aboveground habitable floors • Highly noise-sensitive outdoor nonresidential uses • Aboveground bulk storage of hazardous materials • Critical community infrastructure facilities • Hazards to flight	• Locate structures maximum distance from extended runway centerline • Minimum noise level reduction (NLR) of 25 decibels (dB) in residences (including mobile homes) and office buildings • Airspace review required for objects >35 feet tall • Avigation easement dedication
C	Extended Approach/Departure Zone	75	150	20%	• Children's schools, day care centers, libraries • Hospitals, nursing homes • Buildings with >3 aboveground habitable floors • Highly noise-sensitive outdoor nonresidential uses • Hazards to flight	• Minimum of NLR of 20 dB in residences (including mobile homes) and office buildings • Airspace review required for objects >70 feet tall • Avigation easement dedication
D	Primary Traffic Patterns and Runway Buffer Area	100	300	10%	• Highly noise-sensitive outdoor nonresidential uses • Hazards to flight	• Airspace review required for objects >70 feet tall • Children's schools, hospitals nursing homes discouraged • Deed notice required
E	Other Airport Environs	No Limit	No Limit	No Requirement	• Hazards to flight	• Airspace review required for objects>100 feet tall • Major spectator-oriented sports stadiums, amphitheaters, concert halls discouraged beneath principal flight tracks

Source: Riverside County Airport Land Use Compatibility Plan Policy Document Table 2A, October 2004.

Notes:

1) Usage intensity calculations shall include all people (e.g., employees, customers/visitors) who may be on the property at a single point in time, whether indoors or outside.
2) The total number of people permitted on a project site at any time, except rare special events, must not exceed the indicated usage intensity times the gross acreage of the site. Rare special events are ones (such as an air show at the airport) for which a facility is not designed and normally not used and for which extra safety precautions can be taken as appropriate.
3) Clustering of nonresidential development is permitted. However, no single acre of a project site shall exceed the indicated number of people per acre.
4) Open land requirements are intended to be applied with respect to an entire zone. This is typically accomplished as part of a community general plan or a specific plan, but may also apply to large (10 acres or more) development projects.
5) The uses listed here are ones that are explicitly prohibited regardless of whether they meet the intensity criteria. In addition to these explicitly prohibited uses, other uses will normally not be permitted in the respective compatibility zones because they do not meet the usage intensity criteria.
6) As part of certain real estate transactions involving residential property within any compatibility zone (that is, anywhere within an airport influence area), information regarding airport proximity and the existence of aircraft overflights must be disclosed. This requirement is set by state law.

Policy 3.1.6. *Other Development Conditions: All types of proposed development shall be required to meet the additional conditions listed in Table 2A* [Table 3.3.8-1 above] *for the respective compatibility zone where the development is to be located. Among these conditions are the following:*

1) *Aviation Easement Dedication: See Policy 4.3.5.*
2) *Deed Notice: See Policy 4.4.3.*
3) *Real Estate Disclosure: See Policy 4.4.2.*
4) *Noise Level Reduction: See Policy 4.1.6.*
5) *Airspace Review: See Policy 4.3.3.*

Riverside County Hazardous Waste Management Plan

The Riverside County Hazardous Waste Management Plan (CHWMP) uses a framework of 24 existing and recommended programs. The CHWMP serves as the County's primary planning document for the management of hazardous substances. Although the title refers only to hazardous waste, the CHWMP is a comprehensive document containing all of the County programs for managing both hazardous materials and waste.

Southern California Hazardous Waste Management Authority

The SCHWMA was formed through a joint powers agreement between Santa Barbara, Ventura, San Bernardino, Orange, San Diego, Imperial, and Riverside Counties and the Cities of Los Angeles and San Diego. Each SCHWMA county has agreed to take responsibility for the treatment and disposal of hazardous waste in an amount that is at least equal to the amount generated within that county. This responsibility can be met by siting hazardous waste management facilities (transfer, treatment, and/or repository) capable of processing an amount of waste equal to or larger than the amount generated within the county, or by creating intergovernmental agreements between counties to provide compensation to a county for taking another county's waste, or through a combination of both facility siting and intergovernmental agreements. When and where a facility is to be sited is primarily a function of the private market. However, once an application to site a facility has been received, the county will review the requested facility and its location against a set of established siting criteria to ensure that the location is appropriate, and may deny the application based on the findings of this review. The County of Riverside does not presently have any of these facilities within its jurisdiction and therefore must rely on intergovernmental agreements to fulfill its fair share responsibility to SCHWMA.

Riverside County Department of Environmental Health

The Riverside County Department of Environmental Health, under the Health and Safety Code, is responsible for oversight of activities pertaining to the generation, storage, handling, disposal, treatment, and recycling of hazardous waste. Ordinance No. 615.3 has been implemented for the purpose of monitoring establishments where hazardous waste is generated, stored, handled, disposed, treated, or recycled and to regulate the issuance of permits and the activities of establishments where hazardous waste is generated. The Department of Environmental Health also contains a Hazardous Materials Management Branch, which is the CUPA for the entire County, and oversees all hazardous materials and hazardous waste-related activities.

Riverside County Brush Clearance

County of Riverside Ordinance No. 695 provides brush clearance requirements on unincorporated County land that are designed to reduce risks from wildland fires. The code requires that every owner, occupant, and person in control of any unimproved parcel of land clear vegetation on a 100-foot-wide strip of land at the boundary of the parcel adjacent to a roadway and/or a 100-foot-wide strip of land around any structures located on an adjacent improved parcel. The Riverside County Fire Department can require different clearance distances based upon a visual inspection of the parcel and factors including local weather conditions, fuel types, topography, and the environment where the property or adjoining structures are located.

City of Blythe General Plan 2025

Policies related to hazards included with the City of Blythe General Plan 2025 are provided below.

Safety Element

Policy 18: *Identify facilities utilizing, storing, or transporting hazardous materials in Blythe.*

Policy 19: *Ensure that new facilities involved with handling hazardous materials are located at a safe distance from other land uses that may be adversely affected by this activity.*

Policy 20: *Apply, as appropriate, provisions of the Riverside County Hazardous Waste Management Plan to decisions involving hazardous materials in Blythe.*

Policy 21: *Coordinate enforcement of the Hazardous Materials Disclosure Law with the City of Blythe Fire Department.*

Policy 23: *Minimize the impact of transportation related accidents involving hazardous materials.*

Policy 25: *Ensure that hazardous obstructions to the navigable airspace do not occur.*

Policy 27: *Minimize the risks associated with visual hazards including distracting lights, glare and sources of smoke.*

EMF Recommendations and Standards

Several entities have developed guidelines for EMF exposure, including individual states, the FCC, the Institute of Electrical and Electronics Engineers (IEEE), and the American Conference of Governmental Industrial Hygienists (ACGIH). Neither the national nor state governments have regulations limiting EMF exposure from power transmission lines. However, the California EMF Program has been established by the California Public Utilities Commission's (CPUC) Decision 93-11-013. The program is a research, education, and technical assistance program concerned with the possible health effects of EMF from power lines, appliances, and other uses of electricity. The California EMF Program's goal is to find a rational and fair approach to dealing with the potential risks, if any, of exposure to EMF (CaEMF 2012).

The IEEE has developed guidelines for EMF exposure. The IEEE levels are recommendations only, not regulations. The IEEE Standard C95.6 recommends limits on exposures to magnetic fields, electric fields, and contact currents in the frequency range of 0 to 3000 hertz (Hz). Exposure limits are derived for both controlled (occupational, live-line workers) and uncontrolled (publicly accessible) environments, for uniform and non-uniform fields, and for whole-body and extremity exposures. The FCC's standards are mandatory for occupational exposure to EMF for FCC licensees and grantees and only cover the frequency range from 300 kHz to 100 GHz (FCC 1999). The ACGIH provides that occupational exposures should not exceed 10 Gauss (G) (10,000 mG). The ACGIH guideline level is intended to prevent effects, such as induced currents in cells or nerve stimulation. However, the ACGIH guidelines are for occupational exposure, not general public exposure (AIHA 2002).

The United States does not have any regulations on EMF exposure; however, the European Union has developed EMF guidelines based on recommendations by the International Commission on Non-Ionizing Radiation Protection (ICNIRP). The ICNIRP has made a series of recommendations for limiting EMF exposure to humans based on the epidemiological data available from verifiable research studies (ICNIRP 1998). Based on the ICNIRP's work, the EU has adopted these same standards for EMF exposure (Council Recommendation 1999). While the guidelines are voluntary, the levels are designed to prevent undue health risks associated with EMF exposure.

TABLE 3.3.8-3 ICNIRP EMF LIMITS

FREQUENCY	ELECTRIC FIELD STRENGTH (V/M)	MAGNETIC FIELD (µT)
Occupational: 60 Hz	10,000	1
Public: 60 Hz	5,000	200

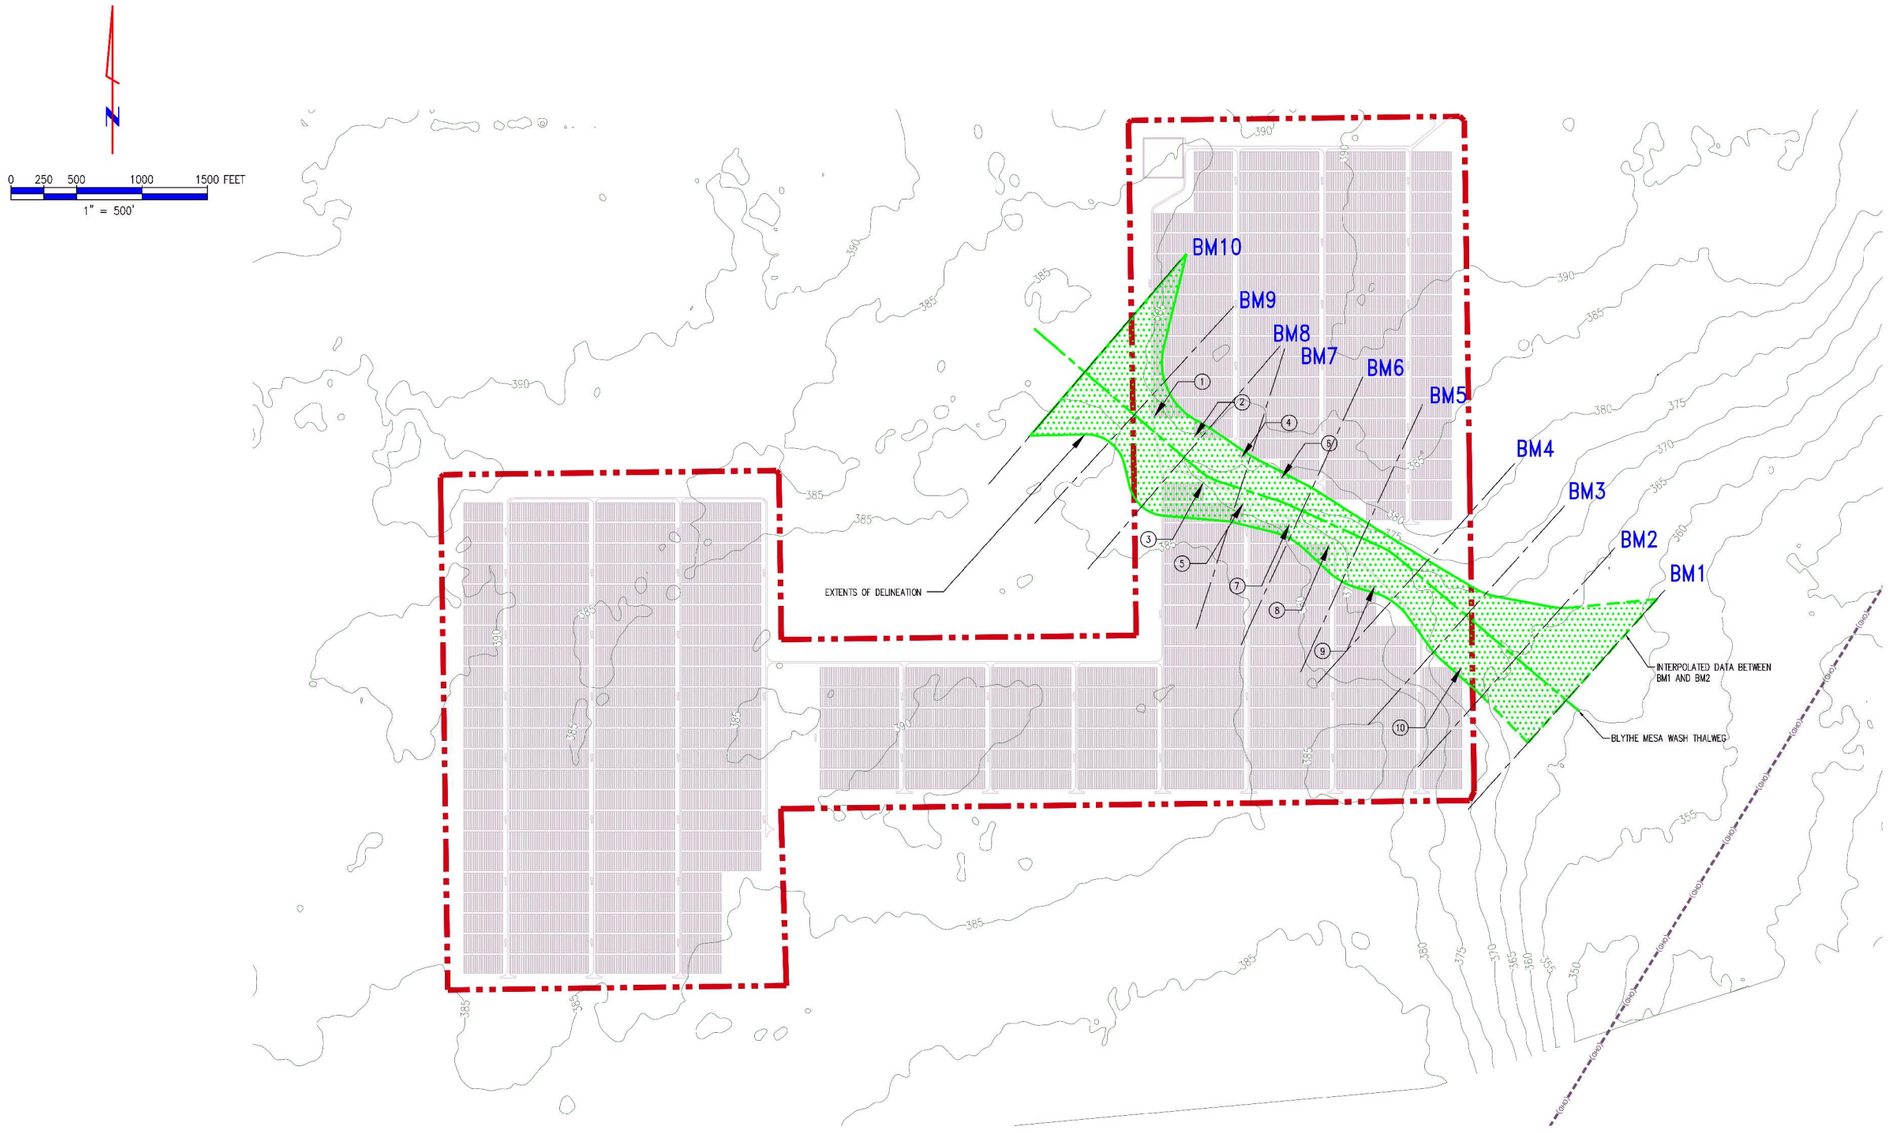
V/M = volts per meter, Hz = frequency in Hertz
µT= microtesla

3.2.9 Hydrology and Water Quality

The purpose of this section is to inventory and describe existing water resources in the vicinity of the proposed Project and Alternatives. In addition to describing the existing conditions, this analysis presents the regulatory framework and examines the affected environment within the Project footprint and vicinity, where appropriate. This section utilizes information from the *Water Supply Assessment for the Blythe Mesa Solar Project,* prepared by POWER Engineers, Inc. 2013 (provided in Appendix G of this Draft EIR/EA), as well as the *Blythe Mesa CUP 03685 Wash Feature Summary of Findings*, prepared by POWER Engineers, Inc. 2013 (provided in Appendix H of this Draft EIR/EA).

Existing Setting

The proposed Project and Alternatives are located in the Colorado Desert, which is part of the greater Colorado Desert Geomorphic Province. The physiography of the area consists of mountains, alluvial fans, alluvial fan remnants, and alluvial valleys, including active drainages and fluvial terraces, and internally drained basins (USDA 2006). Elevations in the Project vicinity range from 260 feet near the Colorado River to 2,054 feet on McCoy Peak. The Project area is characterized by rural development intermixed with agricultural and undeveloped lands. Extensive areas to the north and east are preserved open space, set aside for recreation, wildlife, and protected species.



The Colorado Desert has the lowest annual precipitation and highest temperatures in North America. In the Blythe area, temperatures range from average summer highs of 108.5°F (42.5°C) to average winter highs of 67.6°F (19.8°C). Precipitation occurs in the form of rainfall; the average annual rainfall for Blythe is 3.83 inches, primarily from late summer thunderstorms moving north from Mexico (Colorado RWQCB 2006).

Surface Waters

The Project is located in an undefined Hydrologic Sub-Area (HSA 715.40) of the Palo Verde Hydrologic Area (Palo Verde Mesa) within the Colorado (River) Hydrologic Unit in eastern Riverside County, California. The Colorado River is the largest river in the region, with a watershed encompassing approximately 244,000 square miles in portions of seven states (Wyoming, Utah, Colorado, Nevada, New Mexico, Arizona, and California), and provides water to over 25 million people and approximately 3.5 million acres of agricultural lands in the United States and Mexico. In addition, hydroelectric generation facilities in the Colorado River Basin provide approximately 12 billion kilowatt hours of energy annually (MSCP 2004).

Due to the low precipitation rates, surface water is generally minimal on the Palo Verde Mesa, limited to ephemeral and intermittent drainages with the exception of the Colorado River. [4] The Project would be located near the eastern edge of the Palo Verde Mesa, above the Palo Verde Valley and west of the 100-year floodplain of the Colorado River. Lands in this area that are not utilized for agriculture are crossed by a number of small ephemeral drainages, generally flowing from northwest to southeast toward the Colorado River, either dissipating prior to reaching the edge of the Mesa or flowing into the valley. An ephemeral drainage bisects the southern portion of the proposed Project and transmission line. This

[4] An ephemeral drainage has flowing water only during, and for a short duration after, precipitation events in a typical year whereas an intermittent drainage has regular flows during certain times of the year.

POINT	WATER DEPTH (FT)	VELOCITY (FT/S)	SCOUR (IN)
1	2.66	7.0	16
2	1.62	2.2	9
3	2.77	4.6	14
4	0.49	1.6	7
5	2.64	6.1	15
6	0.42	3.2	9
7	1.83	3.4	11
8	2.65	6.2	15
9	0.91	2.0	8
10	0.41	1.4	6

FIGURE 3.2.9-1

THIS PAGE INTENTIONALLY LEFT BLANK

drainage originates in the McCoy Mountains northwest of the proposed Project, and flows southeast, partially contained by a berm. Approximately one mile south of highway I-10 the dike ends and the drainage continues as a broad, shallow channel beneath the proposed gen-tie line and through the proposed solar array field. During larger storm events flow from this ephemeral drainage eventually connects with the Colorado River, as described below.

Precipitation in the form of sheet flow typically flows overland toward the edge of the Mesa. In areas used for agriculture, flow may be diverted by earthen berms or irrigation ditches. Sheet flow eventually reaches the edge of the Mesa and flows into the canal and drain system of the Palo Verde Valley south of 10th Street. This system eventually returns water to the Colorado River via the Outfall Drain, located approximately 18 miles south of the Project area. Water supplies for the Project area comes from the Colorado River, which lies eight miles east and is the primary source of irrigation water for the existing agriculture in the area. In 2010, the PVID reported that the Project area used approximately 12,000 ac-ft/yr of surface water to irrigate the agricultural fields.

Floodplains

The Palo Verde Mesa is located above the 100-year floodplain of the Colorado River (FEMA 2013). Within the Project area, a 100-year floodplain is associated with the ephemeral drainage discussed above. This floodplain was delineated based on site topography and predicted flow elevations and illustrated in Figure 3.2.9-1. The majority of this floodplain lies within the setback for this ephemeral drainage; however, due to the relatively flat topography of the area and lack of defined bed and bank, small portions of this floodplain may lie outside the limits of the setback (POWER 2013b).

Jurisdictional Waters

During large storm events, many of the ephemeral streams and washes in the Project area flow across the mesa and into the canal and drain system of the Palo Verde Valley; from this system, stormwater eventually flows into the Colorado River via the Outfall Drain, as described previously. As the Colorado River is a Traditional Navigable Water of the United States, tributaries that drain into it are likewise considered Waters of the United States as defined in Section 404 CWA. Stormwater within the ephemeral channel that crosses the southern portion of the Project eventually reaches the canal and drain system as sheet flow (see Figure 3.2.9-2). The USACE delineated the potential Ordinary High Water Mark (OHWM) of this drainage within Project limits, as illustrated in Figure 3.2.9-3. The potential OHWM lies within the Project area setback with exception of one gen-tie line pole.

Water Quality

The Project area lies within the East Colorado River Basin Planning Area of the Water Quality Control Plan (Basin Plan) for the Colorado River Regional Water Quality Control Board (RWQCB). This Basin Plan describes surface and groundwater quality objectives for the Planning Area; the objectives were established to protect the existing and potential beneficial uses of surface and groundwater in the region. Beneficial are reasonable uses of a water body as specified in the Basin Plan, and may include existing, proposed, or intermittent uses. Beneficial uses for water bodies in the Project area (solar facility site and gen-tie line) are listed in Table 3.2.9-1, and include the following: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Aquaculture (AQUA), Industrial Service Supply (IND), Ground Water Recharge (GWR), Water Contact Recreation (REC-1), Non-Contact Water Recreation (REC-2), Warm Freshwater Habitat (WARM), Wildlife Habitat (WILD), Hydropower Generation (POW), and Preservation of Rare, Threatened, or Endangered Species (RARE).

Water quality is the physical, chemical, and biological characteristics of water, when assessed according to standards related to ecosystem health, the safety of drinking water, and the safety of human contact. The State of California Water Resources Control Board (SWRCB) and the nine RWQCBs are responsible for setting policies and developing regulations for the implementation of water quality control programs mandated by federal and State water quality statutes and regulations. Basin Plans, developed and

implemented by the RWQCBs, consider regional beneficial uses, water quality characteristics, and water quality problems.

TABLE 3.2.9-1 BENEFICIAL USES OF SURFACE WATERS IN THE PROJECT AREA*

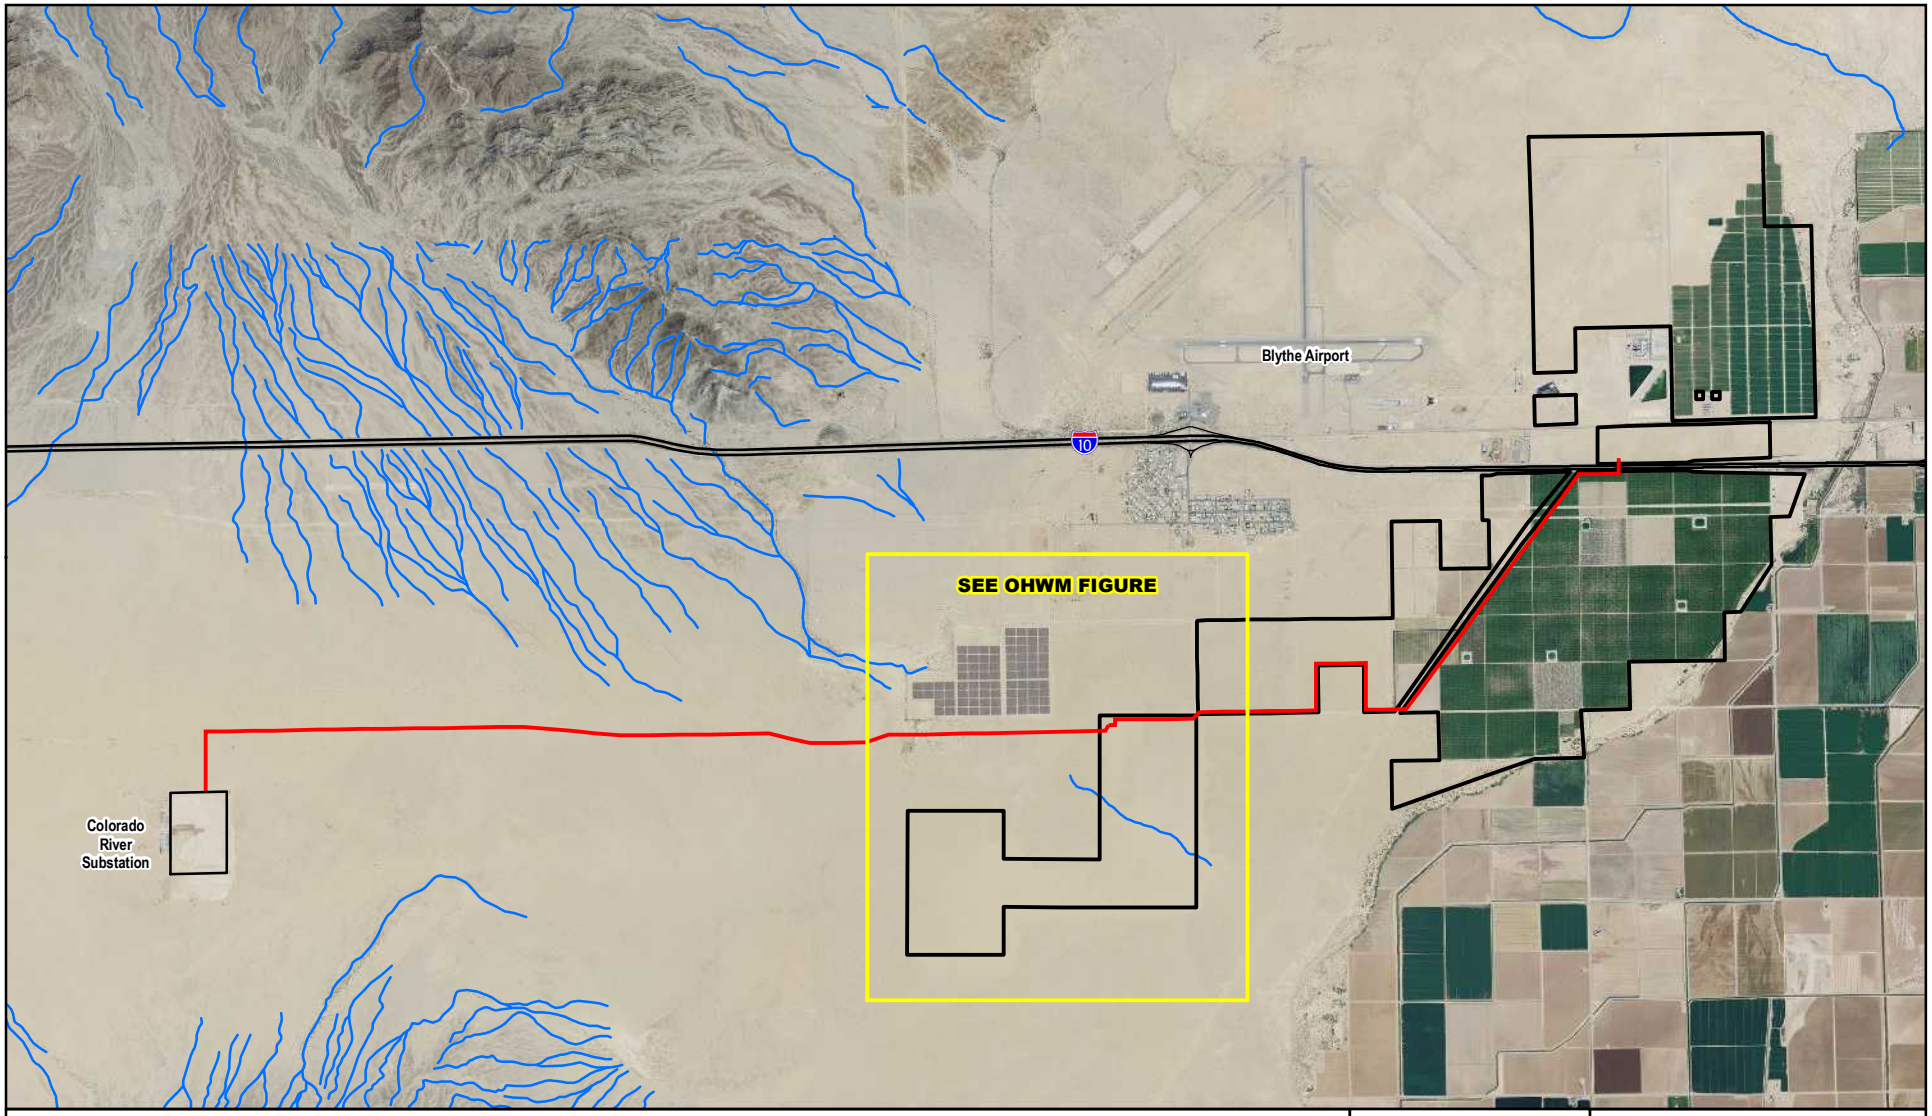
E – Existing use
P – Potential Use
I – Intermittent Use
C – Conditional use, to be determined on a case-by-case basis



Under Section 303(d) of the CWA, states, territories, and authorized Tribes are required to develop a list of surface waters with impaired water quality. These waters on the list do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. The law requires that these jurisdictions establish priority rankings for surface waters on the lists and develop action plans, called Total Maximum Daily Loads (TMDLs), to improve water quality.

On June 28, 2007, the EPA gave final approval to California's 2006 Section 303(d) List of Water Quality Limited Segments. Section 303(d)-listed or impaired streams and completed TMDL requirements are identified as part of the resource inventory of the Project area. Impaired streams are considered sensitive resources in the routing of transmission lines and are protected from water quality impacts.

Within the Project region, one water body is listed as impaired on the Section 303(d) list. The Palo Verde Outfall Drain and Lagoon are listed as impaired by dichlorodiphenyltrichloroethane (DDT) and pathogens, both from unknown sources.

Groundwater

The Project area is located within the Palo Verde Mesa Groundwater Basin (Groundwater Basin Number 7-39), which has a drainage area of approximately 353 square miles. Groundwater in this basin is located in alluvial deposits with no known barriers that inhibit groundwater flow. Groundwater in this basin is likely recharged from percolation of runoff from the surrounding mountains; percolation of precipitation to the valley floor and subsurface inflow from the adjacent Chuckwalla Valley Groundwater Basin (Groundwater Basin Number 7-5 and adjacent irrigation canals and drains may be additional sources of recharge). According to groundwater level data provided by the California Department of Water Resources (2011), depth-to-groundwater near the Project area ranges from approximately 148 feet below the surface, just north of the Blythe Airport, to approximately 83 feet below the surface near the intersection of Hobson Way and Keim Boulevard. It should be noted that groundwater levels are influenced by seasonal variations, variations in ground surface topography, precipitation, irrigation practices, soil/rock types, groundwater pumping, and other factors and are subject to fluctuations. The storage capacity of the Palo Verde Mesa Groundwater Basin is estimated to be approximately 6,840,000 acre-feet (AF) (DWR 1975). Groundwater quality in this basin is calcium-sodium chloride or calcium-sodium sulfate in character, and is impaired by arsenic, selenium, fluoride, chloride, boron, sulfate, and total dissolved solids (TDS) content (DWR 2004).

THIS PAGE INTENTIONALLY LEFT BLANK

A water budget for the Palo Verde Mesa Groundwater Basin estimates an inflow of approximately 817 AF per year (ac-ft/yr), based on inflow estimates from the surrounding groundwater basins irrigation return flow, infiltration from precipitation events, and infiltration from canal seepage. Recharge by underflow from Chuckwalla Valley is estimated to be 400 af/yr (DWR 2004).

Regulatory Setting

Federal

Section 404 CWA. Waters of the United States including wetlands are subject to USACE jurisdiction under Section 404 of the CWA. A Section 404 permit is required for the discharge of dredged or fill material into Waters of the United States. The Los Angeles District of the USACE would provide review and permitting services for this Project. Field reconnaissance surveys, analyses of NWI and watershed data have determined the presence of one jurisdictional water of the United States within the Project area, as discussed previously

Section 401 CWA. Pursuant to Section 401 of the CWA, a water quality certification (Certification) is required from the Colorado River RWQCB if a federal agency proposes to license or permit a discharge into waters of the United States, to ensure such discharge does not violate state water quality standards. The is generally understood to apply to, but is not limited to, Section 404 permits. The Colorado River RWQCB certifies that discharges to Waters of the United States or Waters of the State complies with State water quality standards and ensures that there is no net loss of wetlands through impact avoidance, minimization, and mitigation. Most Certifications are issued in connection with USACE CWA Section 404 permits; however, the RWQCB regulates isolated waters under Section 401(c) of the CWA as Waters of the State regardless of USCAE jurisdiction.

Section 303(d) CWA. Section 303(d) unites the water quality management strategies of the CWA. Section 303(d) requires that states make a list of waters that exceed the minimum level of pollutants put in place by the CWA. For waters on this list, the states must develop TMDLs that account for all sources of the pollutants that caused the water to be listed. The TMDLs must account for contributions from both point sources and nonpoint sources, as defined by Section 502 of the CWA. In California, the SWRCB has interpreted State law (see Porter-Cologne Water Quality Control Act below) to require that implementation of TMDLs be addressed when incorporated into Basin Plans.

State

Construction Stormwater Program. The SWRCB and the nine RWQCBs implement water quality regulations under the federal CWA and the California Porter-Cologne Water Quality Control Act. Existing water quality regulations require compliance with the NPDES for discharges of stormwater runoff associated with construction activity.

Dischargers are required to obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction and Land Disturbance Activities (Construction General Permit, 2009-0009-DWQ). Construction activity subject to this permit includes clearing, grading, and disturbances to the ground, such as stockpiling or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility.

The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP should contain a site map(s) that shows the construction site perimeter, existing and proposed structures, lots, roadways, stormwater collection and discharge points, general topography both before and after construction, and drainage patterns across the Project. The SWPPP must list Best Management Practices (BMPs) the discharger will use to protect stormwater runoff and the placement of those BMPs. Additionally, the SWPPP must contain a monitoring program for visible and non-visible pollutants and changes in water quality, such as substantial alteration in pH (a measure of acid and base properties).

Lake or Streambed Alteration Agreement. Sections 1601-1603 of the CDFW Fish and Game Code protect the natural flow, bed, channel, and bank of any river, stream, or lake designated by the CDFW, in which there is at any time an existing fish or wildlife resource, or from which these resources derive benefit. General Project plans must be submitted to the CDFW in sufficient detail to indicate the nature of a project for construction, if the project would:

- Divert, obstruct, or change a streambed, bank, or riparian zone.
- Use material from the streambeds.
- Result in the disposal or deposition of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a stream.

The Inland Deserts Region of the CDFW serves Riverside County.

Porter-Cologne Water Quality Control Act. The Porter-Cologne Water Quality Control Act defines "water quality objectives" as the allowable "limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area." Thus, water quality objectives are intended to protect the public health and welfare, and to maintain or enhance water quality in relation to the existing and/or potential beneficial uses of the water. Water quality objectives apply to both Waters of the United States and Waters of the State.

Basin Plans. The SWRCB requires individual RWQCBs to develop Basin Plans (water quality control plans) designed to preserve and enhance water quality and protect the beneficial uses of all Regional waters. Specifically, Basin Plans designate beneficial uses for surface waters and groundwater, set narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's antidegradation policy, and describe implementation programs to protect all waters in the Regions. In addition, Basin Plans incorporate by reference all applicable State and Regional Board plans and policies, and other pertinent water quality policies and regulations. The Project is under the jurisdiction of the Basin Plan of the Colorado River Regional Water Quality Control Board.

Regional and Local

City of Blythe General Plan

Portions of the Project fall within the jurisdiction of the City of Blythe. The Open Space and Conservation Element of the City of Blythe General Plan 2025 (2007) sets forth guiding policies for the preservation of water quality within the zoning area of the City.

Open Space and Conservation Element

Policy 20: *Enhance the quality of surface water resources of the Planning Area and prevent their contamination.*

Policy 21: *Comply with the Regional Water Quality Control Board's regulations and standards to maintain and improve groundwater quality in the Planning Area.*

Policy 22: *Where feasible, given flood control requirements, maintain the natural condition of waterways and flood plains and protect watersheds to ensure adequate groundwater recharge and water quality.*

3.2.10 Land Use and Planning

This section describes the environmental setting and regulatory framework in regards to land use and planning for the proposed Project and Alternatives. Applicable local land use plans include the General Plans and Zoning Ordinances/Codes for Riverside County and the City of Blythe and the Riverside County Airport Land Use Compatibility Plan. Approximately 3.8 miles of the 230 kV gen-tie line would

traverse public lands managed by the BLM. The gen-tie line is located within or adjacent to CDCA Utility Corridor K and Section 368 Federal Energy Corridor 30-52, which overlap, and is within the Riverside East (SEZ). BLM-administered lands are not zoned, and may be encumbered by easements, ROWs, mining claims, and permits. Information regarding BLM ROW authorizations and easements were obtained from the Land & Mineral Legacy Rehost 2000 System of automated records (LR2000). Applicable federal land use plans include, the CDCA Plan (BLM 1980), as amended, and the Northern and Eastern Colorado Desert Coordinated Management Plan. The CDCA Plan was amended by the Approved Resource Management Plan Amendments/Record of Decision for Solar Energy Development in Six Southwestern States (Western Solar Plan) (2012) to identify all SEZ lands within the CDCA as sites associated with power generation or transmission (at p. 36). The Project area is also encompassed within the Blythe Airport Land Use Compatibility Plan. Please see Section 3.2.8, Hazards and Hazardous Materials above for a discussion of compatibility with the ALUCP.

Environmental Setting

Regional Setting

The Project area is located in the Palo Verde Valley along the western edge of the Colorado River in the Colorado Desert. Palo Verde Valley consists of the valley floor and the Palo Verde Mesa. The proposed Project and Alternatives are on Palo Verde Mesa. The topography on the Palo Verde Mesa is relatively flat and slopes toward the southeast. Elevations range from 260 to 400 feet amsl. The Project area is near the Big Maria Mountains on the northwest, the McCoy Mountains on the west, the Mule Mountains on the southwest, and the Colorado River on the east. These mountain ranges, trending northwest to southeast, create a natural barrier between the Colorado River and the greater Colorado Desert. Development in the surrounding area consists of agricultural fields and groves, residences, the Blythe Airport, the Blythe Generating Plant, electrical transmission lines, and commercial businesses. The Project area also includes undeveloped open desert that is managed by the BLM (refer to Figure 1-1, in Chapter 1). The Project area would be located in eastern Riverside County, approximately five miles west of the Colorado River and 40 miles east of Desert Center (refer to Figure 1-2, in Chapter 1). The Project would be located north and south of I-10 and west of State Route 89 and Highway 95.

On-Site Land Uses

The Project is located within unincorporated Riverside County, City of Blythe Sphere of Influence, the City of Blythe, and on BLM-managed lands. The proposed 485 MW PV electrical generating facility and 8.4-mile gen-tie line would occupy a total of 3,660 acres. The fenced-in solar PV electric generation facility would occupy 3,587 acres on privately owned land—3,253 acres under the jurisdiction of the County and 334 acres under the jurisdiction of the City of Blythe. The solar facility would be located on the Palo Verde Mesa. Within the solar facility site, the 230 kV gen-tie line would connect all three proposed on-site substations, extending a distance of approximately 3.6 miles on-site. From the southernmost on-site substation to the Colorado River Substation, the gen-tie line would extend another 4.8 miles within a 125-foot-wide ROW (or 73 acres), traversing 3.8 miles of BLM-managed lands (58 acres) and one mile of private land (15 acres). The gen-tie line situated on BLM land would traverse open access roads (i.e., access by motorized vehicles is allowed).

Agriculture is the predominant land use on-site. The proposed solar facility includes both active and previously farmed agricultural lands. Active agricultural uses include a citrus grove, wheat, and alfalfa fields. Jojoba was previously grown for commercial purposes. Two existing occupied housing units are located on the proposed solar facility. The Project would be situated on both the north and south sides of I-10, a major regional transportation corridor extending east-west through the area. The site is located generally west of Neighbors Boulevard, north of 20th Avenue, and south of 10th Avenue. The zoning for the Project area is illustrated in Figure 1-3 in Chapter 1.

Portions of the Project located within the Palo Verde Valley Area Plan are currently zoned as follows:

- Controlled Development Areas (W-2-10) (10-acre minimum)

- Controlled Development Areas (W-2-5)
- Light Agriculture (A-1-10)
- Heavy Agriculture (A-2-10)

Portions of the Project located within the City of Blythe are currently zoned:

- Agriculture (A)
- Service Industrial (I-S)

Surrounding Land Uses

Land uses surrounding the Project consist primarily of open space and agricultural land to the east and south. Other uses in the area include the unincorporated community of Mesa Verde/Nicholls Warm Springs, Blythe Airport, Blythe Energy Center, NRG Solar – Blythe Solar Project, Blythe Substation, electrical transmission lines, ancillary agricultural facilities, and dirt roads.

The residential development known as Mesa Verde (Nicholls Warm Springs) is located on the south side of I-10. This community is mainly composed of single-family dwellings and mobile homes. There are also a small number of dispersed farm and rural residences near the solar facility, mostly located to the south and east. The nearest residence is located approximately 260 feet east of the proposed solar facility.

The Blythe Airport is located one mile to the west, and highway-serving commercial uses are located at the interchange south of the Airport on the north side of I-10. The 3,094-acre airport is the largest in eastern Riverside County and serves primarily general aviation demand in the Blythe area. The Airport is classified in the National Plan of Integrated Airport Systems as a general aviation transport airport, designed to accommodate business jets, cargo type aircraft, light private planes, and flight school training activities. The Blythe Airport currently has two runways (8/26 and 17/35). The primary runway is Runway 8/26, which is oriented generally east-west. This public facility, owned by Riverside County and managed by the City of Blythe, is often used as a base for crop spraying operations, flight rental, and flight instruction. Aircraft operations average 69 per day (AirNav 2012). The Blythe Airport has been designated as a County redevelopment area with the intent to encourage expansion of airport facilities and commercial and industrial development at the airport.

Blythe Substation, situated east of the Blythe Airport, is owned by the Western Area Power Administration and connects five existing 161 kV transmission lines serving the region. The Blythe 230 kV gen-tie line also crosses the site in a northeasterly to southwesterly direction.

The area is also served by a spur line of the Arizona and California Railroad, I-10, and two State Highways. State Highway 95 runs north from Blythe to Needles and Las Vegas. State Highway 78 traverses the desert southwest from Blythe to the Imperial Valley.

Table 3.2.10-1 summarizes the existing land uses and general and area plan land use designations for the Project and surrounding area.

Source: General Plan and Zoning Map for City of Blythe (03/29/07).
Riverside County Land Information System (accessed 08/04/11).

The Project would be located on lands under the jurisdiction of the County of Riverside, the BLM, and the City of Blythe. A majority of the Project would be located within the County of Riverside and within the PVVAP. A portion of the solar array would be in the City of Blythe, and is subject to the City's General Plan. A portion of the Project's 230 kV gen-tie line would traverse BLM-managed lands. Refer to Figure 1-3 in Chapter 1, which illustrates the zoning for the County of Riverside and City of Blythe.

The adjacent and surrounding zonings within the PVVAP area consist of the following:

- Rural Residential (R-R)
- Light Agriculture (A-1-2 1/2 and A-1-10)
- Controlled Development Areas (W-2-10 and W-2-2 1/2)
- Residential Agricultural (R-A-5)
- Manufacturing-Service Commercial (M-SC)
- Controlled Development with Mobile Homes (W-2-M)
- Tourist Commercial (C-T)
- Scenic Highway Commercial (C-P-S)
- Industrial Park (I-P)
- Manufacturing-Heavy (M-H)
- Mobile Home Subdivision-Rural (R-T-R)
- Heavy Agriculture (A-2-10 and A-2-2 1/2)
- Natural Assets (N-A)

The adjacent and surrounding City of Blythe zoning consists of the following:

- Agriculture (A)
- Rural Residential (R-R)
- General Commercial (C-G)

Figure 1-4 in Chapter 1 illustrates the portion of the Project's gen-tie line that would traverse BLM-managed lands within the CDCA. These lands are designated Multiple-Use Class M (Moderate) which allows energy and utility development (BLM 1980). Within the CDCA, the Project's gen-tie line would be located within BLM's Utility Corridor K, which is also designated as Section 368 Federal Energy Corridor 30-52. Where it crosses public land, the gen-tie would be within the Riverside East SEZ. A majority of the private land portion of the Project would overlap BLM's Utility Corridor J.

Numerous authorized and proposed BLM ROWs are located within and adjacent to BLM Utility Corridor J and Utility Corridor K. Table 3.2.10-2 presents information on the existing and proposed ROWs, including the BLM ROW number, ROW width, total acreage, owner, and project type, which was obtained from BLM's LR2000. The table is organized based on location of the project within (1) Utility Corridor J or (2) Utility Corridor K and Corridor 30-52, which overlap, or (3) both Utility Corridors J and K and Corridor 30-52. Most projects listed in the table are existing ROW authorizations. A few of the proposed solar projects and transmission lines in Table 3.2.10-1, which are identified in bold font, are also listed in Table 4.1-1.

Regulatory Framework

Federal

Federal Land Policy and Management Act, 1976 as Amended

The United States Congress passed the FLPMA in 1976. Title V, "Rights-of-Way," of the FLPMA establishes public land policy and guidelines for administration, provides for management, protection, development, and enhancement of public lands, and provides the BLM authorization to grant ROW. Authorization of systems for generation, transmission, and distribution of electric energy is addressed in Section 501(4) of Title V. In addition, Section 503 specifically addresses "Right of Way Corridors" and requires common ROWs "to the extent practical." FLPMA, Title V, Section 501(a)(6) states, "[t]he Secretary, with respect to the public lands (including public lands, as defined in section 103(e) of this Act, which are reserved from entry pursuant to section 24 of the Federal Power Act (16 U.S.C. § 818)) [P.L. 102-486, 1992] and, the Secretary of Agriculture, with respect to lands within the National Forest System (except in each case land designated as wilderness), are authorized to grant, issue, or renew rights-of-way over, upon, under, or through such lands for roads, trails, highways, railroads, canals, tunnels, tramways, airways, livestock driveways, or other means of transportation except where such facilities are constructed and maintained in connection with commercial recreation facilities on lands in the National Forest System."

The Applicant is requesting a grant of ROW approval from the BLM (Palm Springs-South Coast Field Office) for the portion of the gen-tie line on land under the jurisdiction of the BLM.

California Desert Conservation Area Plan, 1980 as Amended

Section 601 of the FLPMA required preparation of a long-range plan for the CDCA. The CDCA Plan was adopted in 1980 to provide for the use of public lands and resources of the CDCA in a manner that enhances, wherever possible, and does not diminish, on balance, the environmental, cultural, and aesthetic values of the Desert and its productivity. The CDCA Plan is a comprehensive, long-range plan covering 25 million acres. Approximately 12 million acres (about half) of this total are public lands administered by the BLM. These public lands are dispersed throughout the California Desert, which includes the Mojave Desert, the Sonoran Desert, and a small portion of the Great Basin Desert.

The CDCA Plan includes 12 elements: Cultural Resources; Native American; Wildlife; Vegetation; Wilderness; Wild Horse and Burro; Livestock Grazing; Recreation; Motorized Vehicle Access; Geology, Energy and Mineral Resources; Energy Production and Utility Corridors; and Land-Tenure Adjustment. Each of the elements contains goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. In addition, each element provides both a desert-wide perspective of the planning decisions for one major resource or issue of public concern as well as more specific interpretation of multiple-use class guidelines for a given resource and its associated activities.

Chapter 2 of the CDCA Plan identifies four multiple-use classes, which are used to describe a different type and level or degree of use that is permitted within that particular geographic area. The four multiple-use classes are defined below. The Energy Production and Utility Corridors Element of the CDCA Plan indicates that the width of joint-use corridors vary in width from two to five miles. There is an acceptable two-mile standard for separation of existing facilities. A two-mile width generally provides sufficient flexibility in selecting alternative routes for a ROW. Also, a two-mile width generally provides sufficient space for evaluating a number of possible alternate routes. However, the CDCA Plan goes on to explain that the five-mile standard is selected where there is no existing facility and, therefore, little or no engineering and environmental data to define a narrower corridor alignment. The CDCA Plan states that the five-mile standard is also selected in those cases where there are so many facilities or merging corridors that a five-mile width is needed to ensure sufficient space for system integrity and flexibility.

Multiple-Use Class C

Multiple-Use Class C has two purposes. First, it shows those areas that are being “preliminarily recommended” as suitable for wilderness designation by Congress. This process is fully explained in the Wilderness Element in the CDCA Plan. Second, it will be used in the future to show those areas formally designated as wilderness by Congress. The Class C guidelines are different from the guidelines for other classes, as they summarize the kinds of management likely to be used in these areas in the CDCA when and if they are formally designated wilderness by Congress.

Multiple-Use Class L

Multiple-Use Class L (Limited Use) protects sensitive, natural, scenic, ecological, and cultural resource values. Public lands designated as Class L are managed to provide for generally lower intensity, carefully controlled multiple use of resources, while ensuring that sensitive values are not significantly diminished.

Multiple-Use Class M

Multiple-Use Class M (Moderate Use) is based upon a controlled balance between higher intensity use and protection of public lands. This class provides for a wide variety of present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Class M management is also designed to conserve desert resources and to mitigate damage to those resources that permitted uses may cause.

Multiple-Use Class I

Multiple-Use Class I is an "intensive use" class. Its purpose is to provide for concentrated use of lands and resources to meet human needs. Reasonable protection will be provided for sensitive natural and cultural values. Mitigation of impacts on resources and rehabilitation of impacted areas will occur insofar as possible. The proposed gen-tie line would be situated within Multiple-Use Class M under the BLM's CDCA Plan. Multiple-Use Class M allows energy and utility development (BLM 1980).

Utility Corridor K

The CDCA Plan identifies "planning" and "contingency" utility corridors on BLM-administered land. One of the broad goals of the BLM system of utility corridors is to implement the network of joint-use planning corridors to meet projected utility needs. Planning corridors, commonly referred to as "designated" corridors, are the locations where the BLM requests that applicants focus their attention in developing proposals for linear facilities on BLM-administered land. "Contingency" corridors are identified as having potential for use in the future and can become a "designated" corridor after completion of a land use plan amendment. Both types of corridors are identified in the CDCA Plan using an alphabetic designation.

The Project's gen-tie line would be located within BLM Designated Utility Corridor K, as identified in the CDCA Plan. The CDCA Plan designated utility Corridor K for "multi-modal use," allowing the following types of facilities:

- New electrical gen-tie towers and cables of 161 kV or above;
- all pipelines with diameters greater than 12 inches;
- coaxial cables for interstate communications; and
- major aqueducts or canals for interbasin transfers of water.

Utility Corridor K is also designated as Section 368 Federal Energy Corridor 30-52 in the Record of Decision for the West-Wide Energy Corridor Programmatic EIS (BLM 2009). Energy Corridor 30-52 is identified for "multi-modal use," which allows for electricity transmission and distribution facilities, as well as oil, gas, and hydrogen pipelines. Section 368 corridors are identified with a numeric designation and are often overlain on locally designated corridors, as is the case with the east-west Section 368 Corridor 30-52 overlying BLM Designated Utility Corridor K.

Northern and Eastern Colorado Desert Coordinated Management Plan

Refer to Section 3.2.4, *Biological Resources*, and Section 3.2.14*, Recreation*.

Wild Horse and Burro Act of 1971, as Amended

Refer to Section 3.2.4, *Biological Resources*.

California Desert Renewables Energy Conservation Plan

Refer to Section 3.2.4, *Biological Resources*.

Programmatic Environmental Impact Statement to Develop and Implement Agency-Specific Programs for Solar Energy Development

In response to direction from Congress under Title II, Section 211 of the Energy Policy Act of 2005, as well as Executive Order 13212, Actions to Expedite Energy-Related Projects, the BLM and the U.S. Department of Energy have prepared a Solar Programmatic EIS (PEIS) pursuant to NEPA and CEQ regulations. The Solar PEIS evaluates utility-scale solar energy development in a six-state area, including that portion of the CDCA that is open to solar energy development in accordance with the provisions of the CDCA Plan. The Solar PEIS planning effort has focused on identifying locations on BLM lands that are most suitable for solar energy development. Portions of the proposed 230 kV gen-tie line would be

within BLM-managed lands and the Riverside East SEZ; the proposed solar facility is located on private lands and therefore would not be within the Riverside East SEZ. The Final Solar PEIS was released on July 24, 2012. The BLM issued a Record of Decision on October 12, 2012, that amended the CDCA Plan to identify all SEZ lands within the CDCA as sites associated with power generation or transmission.

Local

Land use and planning decisions within and adjacent to the Project area are guided and regulated by the Riverside County General Plan, PVVAP, City of Blythe General Plan, Riverside County Zoning Ordinance, and City of Blythe Zoning Ordinance. The relevant plans contain goals, policies, and implementation measures that provide an overall foundation for establishing land use patterns. This section lists relevant goals, objectives, policies, and implementation measures related to the proposed land use. The Riverside County and City of Blythe Zoning Ordinances contain regulations through which the applicable General Plan's provisions are implemented. The RCALUCP establishes procedures and criteria by which the County can address compatibility issues when making planning decisions concerning airports. The most relevant regulations pertaining to solar energy development are presented below.

Regional Comprehensive Plan and Regional Transportation Plan

Refer to Section 3.2.15, *Traffic and Transportation*.

Riverside County General Plan

Adoption of the 2003 Riverside County General Plan (RCGP) was on October 7, 2003. Through a series of resolutions, the Board of Supervisors adopted an update in 2008. This subsection draws primarily upon the most current, 2008 update. The RCGP consists of a vision statement and the following elements: Land Use, Circulation, Multi-purpose Open Space, Safety, Noise, Housing, Air Quality, and Administration. The RCGP sets forth County land use policies and guidance for implementation. The RCGP is augmented by more detailed Area Plans covering the County's territory. Area Plans provide a clear and more focused opportunity to enhance community identity within the County and stimulate quality of life at the community level.

RCGP land use designations within the Project area include Agriculture (AG) and Estate Density Residential-Rural Community (EDR-RC). The Agriculture land use designation is established to help conserve productive agricultural lands within the County. These include row crops, nurseries, citrus groves and vineyards, dairies, ranches, poultry and hog farms, and other agriculture-related uses. Areas designated AG generally lack an infrastructure that is supportive of urban development. This land use designation allows one single-family residence per 10 acres except as otherwise specified by a policy or an overlay. The RC designation is a foundation component in the RCGP that identifies communities that exhibit a rural character and allows limited development. The EDR land use designation allows single-family detached residences on large parcels of two to five acres. Limited agriculture and intensive equestrian and animal keeping uses are expected and encouraged.

Policies at the General Plan and Area Plan levels implement the vision and goals of Riverside County. The County of Riverside Vision details the physical, environmental, and economic qualities that the County aspires to achieve by the year 2020. Using that Vision as the primary foundation, the RCGP establishes policies for development and conservation within the entire unincorporated County territory (Riverside County 2008). The General Plan's policy goals that are potentially relevant to land use for the Project are provided below. Additional County of Riverside General Plan policy goals are detailed in other sections of this chapter, as applicable to the environmental resource topic analyzed.

Land Use Element (LU)

Policy LU 2.1.c. *The County shall provide a broad range of land uses, including a range of residential, commercial, business, industry, open space, recreation and public facility uses (General Plan pg. LU-20).*

Policy LU 5.1. *The County shall ensure that development does not exceed the ability to adequately provide supporting infrastructure and services (General Plan LU-24).*

Policy LU 6.1. *Require land uses to develop in accordance with the Riverside County General Plan (RCGP) and area plans to ensure compatibility and minimize impacts.*

Policy LU 6.2. *Notwithstanding the Public Facilities designation, public facilities shall also be allowed in any other land use designation except for the Open Space- Conservation and Open Space- Conservation Habitat land use designations. For purposes of this policy, a public facility shall include all facilities operated by the federal government, the State of California, the County of Riverside, any special district governed by the County of Riverside or any city, and all facilities operated by any combination of these agencies.*

Policy LU 7.1. *The County shall accommodate the development of a balance of land uses that maintain and enhance the County's fiscal viability, economic diversity and environmental integrity (General Plan LU-26).*

Policy LU 8.1. *The County shall provide for the permanent preservation of open space lands that contain important natural resources and scenic and recreational values (General Plan LU-28).*

Policy LU 8.2. *Require that development protect environmental resources by compliance with the Multipurpose Open Space Element of the RCGP and federal and state regulations such as CEQA, NEPA, the Clean Air Act, and the Clean Water Act.*

Policy LU 9.1. *Require that new development contribute their fair share to fund infrastructure and public facilities such as police and fire facilities.*

Policy LU 13.1. *The County shall preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public (General Plan LU-31).*

Policy LU 13.5. *Require new or relocated electric or communication distribution lines, which would be visible from Designated and Eligible State and County Scenic Highways, to be placed underground.*

Policy LU 15.15. *The County shall permit and encourage, in an environmentally and fiscally responsible manner, the development of renewable energy resources and related infrastructure, including but not limited to, the development of solar power plants in the County of Riverside (General Plan LU-37).*

Multi-Purpose Open Space Element (OS)

Policy OS 11.3. *Permit and encourage the use of passive solar devices and other state-of-the-art energy resources.*

Policy OS 15.2. *Development of renewable resources should be encouraged.*

Palo Verde Valley Area Plan

The Project is located on the Palo Verde Mesa in the Palo Verde Valley area within unincorporated Riverside County. The Project is within the planning area for the PVVAP. The PVVAP provides customized direction specifically for this easternmost reach of the County. The PVVAP guides the evolving character of the agricultural and desert area. The PVVAP focus is on the Colorado River and is anchored in the City of Blythe. The PVVAP planning area is bordered by Imperial County on the south, desert lands on the north and west, and the Colorado River on the east. The PVVAP is an extension of the RCGP and vision. The PVVAP's policy goals most relevant to the Project are provided in Sections 3.2.1, *Aesthetics, Visual Resources, and Reflection*; 3.2.2, *Agriculture*; 3.2.6, *Geology and Soils*; and 3.2.13, *Recreation*.

Riverside County Land Use Ordinance

Ordinance No. 348.4596 amends Ordinance No. 348 to authorize solar power plants on lots ten acres or larger, subject to a conditional use permit in the following zone classifications: General Commercial (C-1/C-P), Commercial Tourist (C-T), Scenic Highway Commercial (C-P-S), Rural Commercial (C-R),

Industrial Park (I-P), Manufacturing Servicing Commercial (M-SC), Medium Manufacturing (M-M), Heavy Manufacturing (M-H), Mineral Resources (M-R), Mineral Resource and Related Manufacturing (M-R-A), Light Agriculture (A-1), Light Agriculture with Poultry (A-P), Heavy Agriculture (A-2), Agriculture-Dairy (A-D), Controlled Development (W-2), Regulated Development Areas (R-D), Natural Assets (N-A), Waterways and Watercourses (W-1), and Wind Energy Resource Zone (W-E). Ordinance No. 348.4596 was last updated in 2010.

Portions of the proposed solar facility site would be located within unincorporated Riverside County and areas currently zoned[5] as Controlled Development Areas (W-2-10), Controlled Development Areas (W-2-5), Light Agriculture (A-1-10), and Heavy Agriculture (A-2-10).

City of Blythe General Plan and Zoning Ordinance

The City of Blythe General Plan 2025 (General Plan) was adopted in March 2007 and includes the seven elements required by State law (Land Use, Housing, Circulation, Open Space, Conservation, Noise, and Safety) and other elements that address local concerns and regional requirements. The General Plan includes guiding policies and implementing policies. Together, the guiding and implementing policies articulate a vision for Blythe that the General Plan seeks to achieve.

The General Plan land use designations/zones within the solar facility include Agriculture (A) and Service Industrial (I-S). The Agriculture land use designation/zone allows for the continued cultivation of land and for associated uses commonly tied to agriculture including the grazing of animals. Residential units are allowed at a density of one per 20 acres. Agriculture associated commercial uses, feed lots (more than forty head), labor camps, and recreational activities are allowed with a conditional use permit.

For the Agriculture zone, the City of Blythe Zoning Code lists utility operations facilities among the uses permitted through obtaining a conditional use permit.

The I-S land use designation/zone is intended to provide areas appropriate for moderate- to low-intensity industrial uses capable of being located next to commercial and residential areas with minimum buffering. Allowable uses include light manufacturing, wholesaling, distribution, storage, retailing as an accessory use only, and offices in a landscaped setting. Small restaurants and convenience stores will be permitted as ancillary uses, subject to appropriate standards. No raw materials processing would be allowed. The maximum Floor Area Ratio is 0.4, but increases may be permitted, up to 0.8, for uses such as wholesale, distribution, and storage with low employment intensity.

The City of Blythe Zoning Code lists utility operations facilities among the permitted uses in the I-S zone. Utility operations facilities are defined as facilities involved in the operation of the various public and quasi-public utilities, such as telephone switchboard centers, electrical generating plants and terminals, sewage treatment plants, and water pumping stations or reservoirs.

City of Blythe General Plan policies most relevant to land use for the proposed Project are provided below.

Land Use Element

Policy 23. *As required by Public Utilities Section 21676(b), prior to City approval, appropriate pre-zoning, specific plan, planned unit development, individual development projects, or other actions involving land within the City Sphere of Influence and AIA designated "planned development" will be submitted to the ALUC for review.*

[5] Refinements to the County Riverside's zoning is ongoing. The zoning in the Project area was recently updated in 2012; therefore, the zoning classifications listed in Ordinance No. 348.4596 do not match. However, the categories, such as Controlled Development, Light Agriculture, and Heavy Agriculture have not changed.

Open Space and Conservation Element

Refer to Sections 3.2.1, *Aesthetics, Visual Resources, and Reflection;* 3.2.2, *Agriculture*; and 3.2.6, *Geology and Soils*.

3.2.11 Noise

This section describes the environmental setting and regulatory framework in regards to noise for the proposed Project and Alternatives. Noise can be defined as unwanted sound. Human response to noise is most commonly expressed as an annoyance, and the level of annoyance may be affected by the amplitude (intensity or energy content) of the noise, its frequency (pitch), its duration of exposure, and/or its recurrence. Environmental noise is measured in decibels (dB). The A-weighted decibel scale (dBA) is used to approximate the range of sensitivity of the human ear to sounds of different frequencies. A noise level is a measure of noise at a given instance in time. A change in level of at least 5 dBA is noticeable to most people, and a 10-dBA increase is judged by most people as a doubling of the sound level. Typical noise sources and noise environments for common indoor and outdoor activities are listed in Table 3.2.11-1.

TABLE 3.2.11-1 TYPICAL NOISE SOURCES AND NOISE ENVIRONMENTS

COMMON OUTDOOR ACTIVITIES	NOISE LEVELS (DBA)	COMMON INDOOR ACTIVITIES
Jet Fly-over at 1,000 feet	110-120	Rock Band
Gas Lawn Mower at 3 feet	90-100	n/a
Diesel Truck at 50 feet, at 50 mph	80-90	Food Blender at 3 feet
Commercial Area, Gas Lawn Mover at 100 feet	70	Vacuum Cleaner at 10 feet
Heavy Traffic at 300 feet	60	Normal Speech at 3 feet
Quiet Urban Area (daytime)	40-50	Large Business Office
Quiet Urban Area/Suburban Nighttime	30-50	Theater, large Conference Room (background)
Quiet Rural Nighttime	20-30	Library, Bedroom at Night, Concert Hall (background)
NA	20-10	Broadcast/Recording Studio

Source: Caltrans 2009.
mph = miles per hour
NA = not available

The decibel scale is based on logarithms, and two noise sources do not combine in a simple additive fashion; rather, they combine logarithmically. For example, if two identical noise sources produced noise levels of 50 dBA, the combined sound level would be 53 dBA, not 100 dBA.

Noise Exposure and Community Noise

Community noise is primarily the product of many distant noise sources, which change gradually throughout a typical day. During the nighttime, exterior background noises are generally lower than the daytime levels. Most household noise also decreases at night and exterior noise becomes more noticeable. Further, most people sleep at night and are more sensitive to noise intrusion during evening and nighttime hours. To account for human sensitivity to noise levels at differing times of day, the Community Noise Equivalent Level (CNEL) was developed. CNEL is a noise index that accounts for the greater annoyance of noise during the evening and nighttime hours. CNEL values are calculated by averaging hourly L_{eq} (equivalent continuous noise level) sound levels for a 24-hour period, and apply a weighting factor to evening and nighttime L_{eq} values. To account for the fluctuation in noise levels over time, noise impacts are commonly evaluated using time-averaged noise levels. The weighting factor, which reflects increased sensitivity to noise during evening and nighttime hours, is added to each hourly L_{eq} sound level before the 24-hour CNEL is calculated. For the purposes of assessing noise, the 24-hour day is divided into three time periods with the following weighting:

- Daytime: 7 a.m. to 7 p.m., weighting factor of 0 dB
- Evening: 7 p.m. to 10 p.m., weighting factor of 5 dB
- Nighttime: 10 p.m. to 7 a.m., weighting factor of 10 dB

Surrounding land uses dictate what noise levels would be considered acceptable or unacceptable. Rural and suburban areas generally have lower noise levels (approximately 20 to 50 dBA) than commercial or industrial zones (approximately 70 dBA). Levels around 75 dBA are more common around busy urban areas, and levels up to 85 dBA occur near major freeways and airports. In areas with human occupants, noise levels above 45 dBA during nighttime hours may disrupt sleep and therefore may be considered adverse. At 70 dBA, sleep interference effects become considerable (EPA 1974).

Noise Attenuation

Sound level naturally decreases as one moves farther away from the source. The ground surface (reflective or absorptive) is also a factor in the sound levels. Point sources of noise, such as stationary mobile equipment or on-site construction equipment, attenuate (lessen) at a rate of 6.0 dBA per doubling of distance from the source when in an area with a reflective ground surface (e.g., parking lots). In areas where the ground is absorptive (e.g., soft dirt, grass, or scattered bushes and trees), noise attenuation from a point source is 7.5 dBA for each doubling of distance due to ground absorption (Caltrans 1998). Noise from large construction sites would have characteristics of both “point” and “line” sources, so attenuation would generally range between 4.5 and 7.5 dBA per doubling of distance.

Widely distributed noises, such as a street with moving vehicles (a “line” source), typically would attenuate at a lower rate of approximately 3.0 dBA for each doubling of distance between the source and the receiver. If the ground surface between source and receiver is absorptive, the excess ground attenuation rate would be 4.5 dBA for each doubling of distance (Caltrans 1998).

Noise attenuation rates for both line and point sources of noise may also be influenced by atmospheric effects, such as wind and temperature gradients. Trees and vegetation, buildings, and barriers reduce the noise level that would otherwise occur at a given receptor distance.

Vibration

Vibration is an oscillatory motion through a solid medium in which the motion’s amplitude can be described in terms of displacement, velocity, or acceleration. There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as a maximum instantaneous peak of the vibration signal and is typically expressed in units of inches per second (in/sec). The PPV is most frequently used to describe vibration impacts to buildings. The room mean square (RMS) amplitude is the average of the squared amplitude of the signal. Decibel notation (VdB) is commonly used to measure RMS. The decibel notation acts to compress the range of numbers required to describe vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration.

Environmental Setting

The primary noise sources in the proposed Project and Alternatives area are traffic from I-10 and nearby roadways; airplane noise from the Blythe Airport; steam blowing from the Blythe Energy Center, sounds from the agricultural operations; sounds emanating from neighborhoods (e.g., voices, radio and television broadcasts); and naturally occurring sounds (e.g., winds, wind-generated noises). Generally, intermittent, short-term noises do not significantly contribute to longer-term noise averages.

I-10 is a major transportation artery and the primary noise source in the area. Noise measurements within 300 feet of I-10 range from 65 dBA to levels exceeding 82 dBA caused by the passage of heavy trucks (Blythe 2007). During peak use periods, traffic noise levels can range from 80 to 90 dBA at 50 feet from the shoulder of the interstate. State Route 78 experiences lower traffic volumes and vehicle speeds and therefore likely have somewhat lower associated noise levels (BLM 2005). Agricultural activities are

conducted on land within the proposed Project boundary. Noise associated with farming activities includes that generated by heavy equipment used for cultivation and harvesting. Maximum noise levels associated with farm equipment typically range from 75 to 85 dBA at a distance of 50 feet. Noise impact contours for the Blythe Airport range from 65 CNEL, 60 CNEL, to 55 CNEL. The most stringent noise contour boundary (55 CNEL) is approximately 1,000 feet from the runways (RCALUCP 2004).

Ambient noise measurements were not conducted for the proposed Project because information could be extrapolated from noise measurements that were taken for the Blythe Energy Center Project. With the Blythe Energy Center in operation, the lowest average background noise level measured at 16531 West Hobson Way (APN 824-090-025) over any four-hour period was 47 dBA (L_{90}) (CEC 2005). L_{90} is generally taken as the background noise level. The noise level is primarily influenced by highway traffic. Other background noise contributions were attributed to airplane overflights associated with the Blythe Airport. The average ambient noise level on the northern boundary of the Blythe Energy Center was 44 dBA L_{eq} (CEC 1999). The lower noise level is a result of the property being farther away from I-10.

Noise-Sensitive Receptors

In general, residences, schools, hotels, hospitals, and nursing homes are considered to be the most sensitive to noise. Places such as churches, libraries, and cemeteries are also sensitive to noise. Commercial and industrial uses are considered the least noise-sensitive.

There are 369 residences within one mile of the solar facility and illustrated in Figure 3.2.1-1. Table 3.3.11-2 lists the parcel numbers of residences within a 0.25-mile (1,320 feet) of the proposed solar facility site; no residences are within 0.25-mile of the portion of the gen-tie line that extends outside the solar facility site. Within the solar facility site, three existing residences (two residences on APN 863-100-016 and one residence on APN 863-060-015) would be removed as part of the Project and therefore would not be considered sensitive receptors of the Project. The closest residence (APN 824-110-020) is approximately 260 feet away from the property boundary and adjacent to an area of the Project that is proposed to contain solar arrays. In addition, the Project is approximately 0.4 mile (2,200 feet) from the Mesa Verde Park and approximately 0.8 mile (4,400 feet) from the Roy Wilson Community and Child Center. The closest occupied residence to the Project's proposed 230 kV gen-tie line is approximately 0.7 mile (3,670 feet); the closest unoccupied mobile home (APN 863-020-002) is approximately 0.4 mile (1,960 feet). No schools, hospitals, libraries, or convalescent homes are located within one mile of the proposed Project.

TABLE 3.3.11-2 RESIDENCES WITHIN 0.25-MILE OF THE PROPOSED PROJECT

PARCEL NUMBER	DISTANCE FROM PROPOSED PROJECT (FEET)
863-060-015	within solar facility site
863-100-016	within solar facility site (two residences)
824-110-020	260 feet
824-090-025	576 feet
863-020-002	615 feet and 1,250 feet (two residences)
824-110-028	700 feet and 1,085 feet (two residences)
824-110-016	795 feet
824-110-004	855 feet
824-110-022	1,025 feet

Source: Riverside County 2011a.

Regulatory Framework

Federal

Occupational Safety and Health Act

The Occupational Safety and Health Act of 1970 (OSHA) set on-site occupational noise exposure levels, which are regulated in California via the Cal/OSHA. The maximum time-weighted average noise exposure level of workers is 90 dBA over an eight-hour work shift (29 CFR Part 1910.95).

State

California Occupational Safety and Health Administration

The California Department of Industrial Relations, Division of Occupational Safety and Health, enforces Cal/OSHA regulations, which are the same as the federal OSHA regulations described above. The regulations are contained in Title 8 of the CCR, General Industrial Safety Orders, Article 105, Control of Noise Exposure, Section 5095.

California Vehicle Code

The California Vehicle Code, Sections 23130 and 23130.5, limits highway vehicle noise and is enforced by the California Highway Patrol and the County Sheriff's Office.

California State Planning Law

The State of California requires local jurisdictions (via California Government Code Section 65302(f)) to develop general plans that include "Noise Elements." A key component of determining land use compatibility is defining appropriate noise thresholds and where such standards apply. "Noise-sensitive" land use classifications in the state of California include residential areas, schools, convalescent and acute care hospitals, parks and recreational areas, and churches. For exterior living areas, such as yards and patios, the noise threshold guideline for new residential land uses is 55 dBA CNEL and must not exceed 65 dBA CNEL.

Local

Riverside County General Plan

The Riverside County General Plan's Noise Element includes noise compatibility guidance. The Land Use Compatibility for Community Noise Exposure, included in the noise element, indicates that residential low density, single family, duplex, and mobile homes are normally acceptable up to 60 dBA day-night average sound level (L_{dn}) or CNEL.

Riverside County's Ordinance No. 847 addresses noise. Ordinance No. 847 states: "This ordinance is not intended to establish thresholds of significance for the purpose of any analysis required by the California Environmental Quality Act and no such thresholds are hereby established." Accordingly, noise in excess of the standards set in Ordinance 847 does not necessarily create a significant impact. Section 4 of ordinance 847, lists maximum nighttime and daytime sound levels for occupied property by General Plan land use designation (Riverside County 2011b). The most restrictive limit would apply to the nearest occupied receptors, which are classified as Rural Residential. The ordinance indicates the maximum decibel level allowed in Rural Residential is a daytime and nighttime limit of 45 dBA L_{max} (maximum sound level) when measured at the exterior of an occupied property:

- Private construction projects located one-quarter of a mile or more from an inhabited dwelling; or

- private construction projects located within one-quarter of a mile from an inhabited dwelling, provided that: 1) Construction does not occur between the hours of 6 p.m. and 6 a.m. during the months of June through September; and 2) Construction does not occur between the hours of 6 p.m. and 7 a.m. during the months of October through May.

The Riverside County General Plan includes policies that address noise within the County boundaries. The policies that would be applicable to the proposed Project are included below.

Noise Element (N)

Policy N 1.4. *Determine if existing land uses will present noise compatibility issues with proposed projects by undertaking site surveys.*

Policy N 1.5. *Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Riverside County.*

Policy N 3.3. *Ensure compatibility between industrial development and adjacent land uses. To achieve compatibility, industrial development projects may be required to include noise mitigation measures to avoid or minimize project impacts on adjacent uses.*

Policy N 7.1. *New land use development within Airport Influence Areas shall comply with airport land use noise compatibility criteria contained in the corresponding airport land use compatibility plan for the area. Each Area Plan affected by a public-use airport includes one or more Airport Influence Areas, one for each airport. The applicable noise compatibility criteria are fully set forth in Appendix L and summarized in the Policy Area section of the affected Area Plan.*

Policy N 7.4. *Check each development proposal to determine if it is located within an airport noise impact area as depicted in the applicable Area Plan's Policy Area section regarding Airport Influence Areas. Development proposals within a noise impact area shall comply with applicable airport land use noise compatibility criteria.*

Policy N 12.1. *Minimize the impacts of construction noise on adjacent uses within acceptable practices.*

Policy N 12.2. *Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.*

Land Use Element (LU)

Policy LU 6.2(a). *The facility is compatible in scale and design with surrounding land uses, and does not generate excessive noise, traffic, light, fumes, or odors that might have a negative impact on adjacent neighborhoods.*

Policy LU 6.4. *Retain and enhance the integrity of existing residential, employment, agricultural, and open space areas by protecting them from encroachment of land uses that would result in impacts from noise, noxious fumes, glare, shadowing, and traffic.*

Riverside County Airport Land Use Commission New Compatibility Plan

Noise policies related to the Riverside County Airport Land Use Commission's New Compatibility Plan are provided below.

Policy 3.1.4. *Nonresidential Development:* The compatibility of nonresidential development shall be assessed primarily with respect to its usage intensity (the number of people per acre) and the noise-sensitivity of the use. Additional criteria listed in Table 2A shall also apply.

1) The total number of people permitted on a project site at any time, except for rare special events, must not exceed the indicated usage intensity times the gross acreage of the site.

Usage intensity calculations shall include all people (e.g., employees, customers/ visitors, etc.) who may be on the property at any single point in time, whether indoors or outside.
Rare special events are ones (such as an air show at an airport) for which a facility is not designed and normally not used and for which extra safety precautions can be taken as appropriate.

No single acre of a project site shall exceed the number of people per acre indicated in Policy 4.2.5(b) and listed in Table 2A unless special risk reduction building design measures are taken as described in Policy 4.2.6.

The noise exposure limitations cited in Policy 4.1.4 and listed in Table 2B shall be the basis for assessing the acceptability of proposed nonresidential land uses relative to noise impacts. The ability of buildings to satisfy the interior noise level criteria noted in Policy 4.1.6 shall also be considered.

Policy 3.1.6. *Other Development Conditions:* All types of proposed development shall be required to meet the additional conditions listed in Table 2A for the respective compatibility zone where the development is to be located. Among these conditions are the following:

1) Avigation Easement Dedication: See Policy 4.3.5.
2) Deed Notice: See Policy 4.4.3.
3) Real Estate Disclosure: See Policy 4.4.2.
4) Noise Level Reduction: See Policy 4.1.6.
5) Airspace Review: See Policy 4.3.3.

Policy 4.1.1. *Policy Objective:* The purpose of noise compatibility policies is to avoid establishment of noise-sensitive land uses in the portions of airport environs that are exposed to significant levels of aircraft noise.

Policy 4.1.2. *Noise Contours:* The evaluation of airport/land use noise compatibility shall consider both the current and future CNEL contours of each airport as depicted in Chapter 3 of this *Plan*.

1) At most airports in the county, anticipated growth in aircraft operations results in projected future noise contours being larger than current ones. However, in some instances, factors such as introduction of a quieter aircraft fleet mix, planned changes to the configuration of airport runways, or expected modifications to flight procedures can result in current contours being larger than the future contours in some or all of the airport environs. In these cases, a composite of the contours for the two time frames shall be considered in compatibility analyses.
2) For airport at which aircraft activity has substantial seasonal or weekly characteristics, noise contours associated with the peak operating season or days of the week shall be taken into account in assessing land use compatibility.
3) Projected noise contours included in Chapter 3 are calculated based upon forecasted aircraft activity as indicated in an airport master plan or that is considered by the Riverside County Airport Land Use Commission to be plausible (refer to activity data in the Background Data volumes). The Airport Land Use Commission or the entities that operate airports in Riverside County should periodically review these projected noise level contours and update them if appropriate.

Policy 4.1.3. *Application of Noise Contours:* The locations of CNEL contours are among the factors used to define compatibility zone boundaries and criteria. Because of the inherent variability of flight paths and other factors that influence noise emissions, the depicted contour boundaries are not absolute determinants of the compatibility or incompatibility of a given land use on a specific site or a portion thereof. Noise contours can only quantify noise impacts in a general manner. Except on large parcels or blocks of land (sites large enough to have 3 dB or more of variation in CNELs), they should *not* be used as site design criteria. (Note, though, that the airport noise contours set forth in this *Plan* are to be used as the basis for determining compliance with interior noise level criteria as listed in Policy 4.1.6.)

Policy 4.1.4. *Noise Exposure in Residential Areas:* Unless otherwise indicated in the airport-specific policies listed in Chapter 3, the maximum CNEL considered normally acceptable for new residential land uses in the vicinity of the airports covered by this *Plan* is 60 dB for all airports except low-activity outlying airports (Chiriaco Summit and Desert Center) for which the criterion is 55 dB. These standards shall be based upon noise contours calculated as described above.

Policy 4.1.5. *Noise Exposure for Other Land Uses:* Noise level compatibility standards for other types of land uses shall be applied in the same manner as the above residential noise level criteria. The extent of outdoor activity associated with a particular land use is an important factor to be considered in evaluating its compatibility with airport noise. Examples of acceptable noise levels for other land uses in an airport's vicinity are presented in Table 2B.

Policy 4.1.6. *Interior Noise Levels:* Land uses for which interior activities may be easily disrupted by noise shall be required to comply with the following interior noise level criteria.

1) The maximum, aircraft-related, interior noise level that shall be considered acceptable for land uses near airports is 45 dB CNEL in:

    - Any habitable room of single- or multi-family residences;
    - Hotels and motels;
    - Hospitals and nursing homes;
    - Churches, meeting halls, theaters, and mortuaries;
    - Office buildings; and
    - Schools, libraries, and museums.

2) The noise contours depicted in Chapter 3 of this Plan shall be used in calculating compliance with these criteria. The calculations should assume that windows are closed.
3) When reviewed as part of a general plan or zoning ordinance amendment or as a major land use action, evidence that proposed structures will be designed to comply with the above criteria shall be submitted to the ALUC under the following circumstances:

    - Any mobile home situated within an airport's 55-dB CNEL contour. [A typical mobile home has an average exterior-to-interior noise level reduction (NLR) of approximately 15 dB with windows closed.]

City of Blythe General Plan

City policies in the City of Blythe General Plan 2025 (2007) related to noise are located in the Noise Element Guiding Policies of the City General Plan, and include:

Noise Element

Policy 1 (Noise): Protect the citizens of the City of Blythe from the harmful effects of exposure to excessive noise.

Policy S-1: *Areas shall be recognized as noise impacted if exposed to existing or projected future noise levels at the property line which exceed 65 L_{dn} (or CNEL).*

Policy S-2: *Noise sensitive land uses should be discouraged in noise impacted areas unless effective mitigation measures are incorporated into the specific design of such projects to reduce exterior noise levels to 65 dB L_{dn} (or CNEL) or less and 45 dB L_{dn} (or CNEL) or less within interior living spaces. Areas shall be designated as noise-impacted if exposed to existing or projected future noise levels at the exterior of buildings which exceed 60 dB L_{dn} (or CNEL).*

Policy S-3: *New industrial, commercial or other noise generating land uses (including roadways, railroads, and airports) should be discouraged if resulting noise levels will exceed 65 dB L_{dn} (or CNEL) at the boundary areas of planned or zoned noise sensitive land uses.*

Policy S-7: *The City shall review all relevant development plans, programs and proposals to ensure their conformance with the policy framework outlined in this Noise Element.*

Policy S-9: *Development on the Blythe Municipal Airport shall conform with the Blythe Airport Master Plan to minimize the impact of airport operation on noise sensitive land uses.*

Policy S-10: *Proposed land uses within the Airport Influence Area shall be reviewed for consistency with the Noise Compatibility Criteria set forth in Table 8.2-2, with Figure 8-5 Ultimate Noise Impacts used as a review guide.*

Policy 1 (Land Use Compatibility): *Areas within the City of Blythe shall be designated as noise impacted if exposed to existing or projected future noise levels at the exterior of buildings which exceed 60 dB L_{dn} (or CNEL).*

3.2.12 Paleontological Resources

A paleontological resource is any fossilized remains, traces, or imprints of organisms, preserved in or on the earth's crust, that provide the only direct evidence of ancient life. They are considered to be non-renewable resources because they cannot be replaced once they are destroyed. For the purpose of this analysis, and accordance with the BLM Potential Fossil Yield Classification System (PFYC), scientifically significant paleontological resources are defined as vertebrate fossils that are identifiable to taxon and/or element, noteworthy occurrences of invertebrate and plant fossils, and vertebrate trackways.

Paleontological resources were inventoried and are described for the proposed Project and Alternatives. This section summarizes the results of a literature review and records searches regarding paleontological resources that could potentially be impacted by the Project and Alternatives. The information in this section is based on the *Blythe Mesa Solar Project Paleontological Resources Survey Report*, prepared by John Minch and Associates, Inc. 2012 (Appendix I of this Draft EIR/EA). This section also describes the affected environment and regulatory setting for paleontological resources.

Environmental Setting

Geologic Units within the Project Area

According to geologic mapping, Figure 3.2.6-1, the majority of the solar facility is underlain by alluvial deposits of the Palo Verde Mesa of Pleistocene age (Qpv); the gen-tie line corridor is underlain by Quaternary Alluvium of Holocene age (Qa_6) and Aeolian Sand (Qs) Holocene. The alluvial deposits of the Palo Verde Mesa are composed of unconsolidated sand and pebbly sand containing a mixture of local and river pebbles and are moderately to poorly exposed on the Palo Verde Mesa. These unconsolidated to weakly consolidated sediments are locally well-exposed along the scarp of Palo Verde Mesa, which bounds the flood plain of the Colorado River. Scarp exposures typically consist of an upper, slope-forming unit of tan to light-gray, sandy and pebbly alluvium and a lower, cliff-forming unit of light-reddish-brown, interbedded fine-grained sand, silt, and clay. Exposures of Palo Verde Mesa alluvial deposits to the northeast are overlain by, and may interfinger with, alluvial fan deposits. These deposits are interpreted to be fluvial river deposits of probable middle- to late-Pleistocene age.

Paleontological Resource Classifications

Society of Vertebrate Paleontology

The County of Riverside uses the Society of Vertebrate Paleontology (SVP) definitions for four categories of paleontological resource potential (potential for rock units: high, low, undetermined, and no potential) (SVP 1995):

High Potential. Rock units from which vertebrate or significant invertebrate fossils or suites of plant fossils have been recovered and are considered to have a high potential for containing significant nonrenewable fossiliferous resources. These units include, but are not limited to, sedimentary formations, volcanic formations, and sedimentary rock units. Sensitivity comprises both (a) the potential for yielding significant vertebrate, invertebrate, or botanical fossils, and (b) the importance of recovery evidence for new and significant taxonomic, phylogenetic, ecologic, or stratigraphic data. Areas that contain potentially datable organic remains older than Recent are also classified as significant.

Low Potential. Reports in the paleontological literature or field surveys by a qualified vertebrate paleontologist may allow determination that some areas or units have low potential for yielding significant fossils. Such units will be poorly represented by specimens in institutional collections.

Undetermined Potential. Specific areas underlain by sedimentary rock units for which little information is available are considered to have undetermined fossiliferous potentials.

No Potential. Metamorphic and granitic rock units do not yield fossils and therefore have no potential to yield significant nonrenewable fossiliferous resources.

Fossil Yield Classification System

The BLM adopted a different paleontological resource assessment system known as the PFYC System. The PFYC system classifies geologic units based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts, with a higher class number indicating a higher potential. This classification is applied to the geologic formation, member, or other distinguishable unit, preferably at the most detailed mappable level. The BLM uses the PFYC system to assess the potential for discovery of significant paleontological resources or the impact of surface disturbing activities to such resources by using a five class ranking system.

Class 1 – Very Low. Geologic units that are not likely to contain recognizable fossil remains. This class usually includes units that are igneous or metamorphic, excluding reworked volcanic ash units; or units that are Precambrian in age or older. Management concern for paleontological resources in Class 1 units is usually negligible or not applicable. Assessment or mitigation is usually unnecessary except in very rare or isolated circumstances. The probability for impacting any fossils is negligible. Assessment or mitigation of paleontological resources is usually unnecessary. The occurrence of significant fossils is non-existent or extremely rare.

Class 2 – Low. Sedimentary geologic units that are not likely to contain vertebrate fossils or scientifically significant nonvertebrate fossils. This class typically includes vertebrate or significant invertebrate or plant fossils not present or very rare; units that are generally younger than 10,000 years before present; recent aeolian deposits; and sediments that exhibit significant physical and chemical changes (i.e., diagenetic alteration). Management concern for paleontological resources is generally low. Assessment or mitigation is usually unnecessary except in rare or isolated circumstances. The probability for impacting vertebrate fossils or scientifically significant invertebrate or plant fossils is low. Assessment or mitigation of paleontological resources is not likely to be necessary. Localities containing important resources may exist, but would be rare and would not influence the classification. These important localities would be managed on a case-by-case basis.

Class 3 – Moderate or Unknown. Fossiliferous sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence; or sedimentary units of unknown fossil potential. This class is often marine in origin with sporadic known

occurrences of vertebrate fossils, as well as vertebrate fossils and scientifically significant invertebrate or plant fossils known to occur intermittently. The predictability of the fossils within these units is known to be low or poorly studied and/or poorly documented. Potential yield cannot be assigned without ground reconnaissance. Class 3 is subdivided into two groups:

- Class 3a – Moderate Potential. Units are known to contain vertebrate fossils or scientifically significant nonvertebrate fossils, but these occurrences are widely scattered. Common invertebrate or plant fossils may be found in the area, and opportunities may exist for hobby collecting. The potential for a project to be sited on or impact a significant fossil locality is low, but is somewhat higher for common fossils.
- Class 3b – Unknown Potential. Units exhibit geologic features and preservational conditions that suggest significant fossils could be present, but little information about the paleontological resources of the unit or the area is known. This may indicate the unit or area is poorly studied, and field surveys may uncover significant finds. The units in this Class may eventually be placed in another Class when sufficient survey and research is performed. The unknown potential of the units in this Class should be carefully considered when developing any mitigation or management actions.

For Class 3, the management concern for paleontological resources is moderate; or cannot be determined from existing data. Surface-disturbing activities may require field assessment to determine appropriate course of action. This classification includes a broad range of paleontological potential. It includes geologic units of unknown potential, as well as units of moderate or infrequent occurrence of significant fossils. Management considerations cover a broad range of options as well, and could include pre-disturbance surveys, monitoring, or avoidance. Surface-disturbing activities will require sufficient assessment to determine whether significant paleontological resources occur in the area of a proposed action, and whether the action could affect the paleontological resources. These units may contain areas that would be appropriate to designate as hobby collection areas due to the higher occurrence of common fossils and a lower concern about affecting significant paleontological resources.

Class 4 – High. Geologic units containing a high occurrence of significant fossils. Vertebrate fossils or scientifically significant invertebrate or plant fossils are known to occur and have been documented, but may vary in occurrence and predictability. Surface disturbing activities may adversely affect paleontological resources in many cases. This class is subdivided into two groups, based primarily on the degree of soil cover.

- Class 4a – Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than two acres. Paleontological resources may be susceptible to adverse impacts from surface disturbing actions. Illegal collecting activities may impact some areas.
- Class 4b – These are areas underlain by geologic units with high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

The management concern for paleontological resources in Class 4 is moderate to high, depending on the proposed action. A field survey by a qualified paleontologist is often needed to assess local conditions. Management prescriptions for resource preservation and conservation through controlled access or special management designation should be considered. Class 4 and Class 5 units may be combined as Class 5 for broad applications, such as planning efforts or preliminary assessments, when geologic mapping at an appropriate scale is not available. Resource assessment, mitigation, and other management considerations are similar at this level of analysis, and impacts and alternatives can be addressed at a level appropriate to the application.

Mitigation considerations must include assessment of the disturbance, such as removal or penetration of protective surface alluvium or soils, potential for future accelerated erosion, or increased ease of access

resulting in greater looting potential. If impacts to significant fossils can be anticipated, on-the-ground surveys prior to authorizing the surface disturbing action will usually be necessary. On-site monitoring or spot-checking may be necessary during construction activities.

Class 5 – Very High. Highly fossiliferous geologic units that consistently and predictably produce vertebrate fossils or scientifically significant invertebrate or plant fossils, and that are at risk of human-caused adverse impacts or natural degradation.

- Class 5a – Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than two contiguous acres. Paleontological resources are highly susceptible to adverse impacts from surface disturbing actions. Unit is frequently the focus of illegal collecting activities.
- Class 5b – These are areas underlain by geologic units with very high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has very high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

Management concern for paleontological resources in Class 5 areas is high to very high. A field survey by a qualified paleontologist is usually necessary prior to surface disturbing activities or land tenure adjustments. Mitigation will often be necessary before and/or during these actions. Official designation of areas of avoidance, special interest, and concern may be appropriate. The probability for impacting significant fossils is high. Vertebrate fossils or scientifically significant invertebrate fossils are known or can reasonably be expected to occur in the impacted area. On-the-ground surveys prior to authorizing any surface disturbing activities will usually be necessary. On-site monitoring may be necessary during construction activities.

Combining Paleontological Resource Classifications

The two resource classification systems have distinctly different categories to evaluate paleontological resources. Generally, these two classification systems are compatible (see Table 3.2.12-1). However, PFYC classification 3 can potentially be rated three different SVP ratings (high, low, and undetermined).

TABLE 3.2.12-1 COMBINED PFYC AND SVP RATINGS

PFYC RATING	SVP RATING
1 Very Low	Low or No Potential
2 Low	Low Potential
3a Moderate	High or Low Potential
3b Unknown	Undetermined
4 High	High potential
5 Very High	High potential

Regional Paleontological Resources

Literature And Records Search

John Minch and Associates, Inc. prepared a paleontological resources assessment for the proposed Project. Part of the assessment include a literature search, including previously recorded lists of fossils and paleontological fossil localities recorded for the general site vicinity, was reviewed. The purpose of the literature search was to determine: (1) pertinent geologic and paleontologic site information, and (2) the paleontologic sensitivity of identified and/or anticipated geologic units underlying the Project area. The literature search included a review of all available data pertinent to the site, including environmental reports, professional geological publications, paleontological consultant reports, and other unpublished

documents related to regional and/or detailed geologic studies. The review also included the location of geologic maps delineating the geology of the rock formations underlying the Project area.

Records searches at the San Bernardino County Museum (SBCM) and review of databases from the University of California Berkeley Museum of Paleontology (UCBMP) provided additional data. Based on review of the SBCM and UCBMP records, fossil lists, and published and unpublished literature, no known paleontological resource localities are recorded in the Project area. Sedimentary geologic units within the Mojave Desert region are generally isolated and specific to local areas. Without datable ash beds or volcanic flows the age of the various units are generally determined by: 1) relationships to other units; 2) their general appearance; and 3) by their relative degree of dissection. Due to active faulting and differential rates of erosion, units of differing ages often exhibit similar characteristics in different basins. This makes the correlation of units from area to area difficult and speculative. Thus, any fossil localities in Pleistocene sediments are indicative of the high paleontological sensitivity of any Pleistocene sedimentary unit. However, the Pleistocene Colorado River alluvium in the Needles area has yielded the remains of an extinct mammoth. In addition, the Colorado River delta deposits in the northwestern Sonoran Desert have yielded many vertebrate fossils.

Paleontological Resources within the Project Area

Known sedimentary units of late Pleistocene to Recent age are exposed at the ground surface of the solar generation site. Older alluvium underlies the majority of the Project area. Thus, it would not be apparent from surface survey whether paleontological resources exist. The older alluvial sediments of the area are considered to be of high paleontological sensitivity and are known to contain significant fossils in other parts of Southern California. There is a high potential for significant paleontological resources on the portion of the site underlain by Quaternary Alluvium. The fossils recovered from the alluvial deposits of the Palo Verde Mesa are considered to be significant and of high scientific value. The sediments of the Older Alluvium are assigned a high paleontological sensitivity.

Recent alluvium, less than 11,000 years old, is not considered to contain paleontological resources. However, it is often difficult to distinguish recent alluvium from older alluvium because deposition has been continuous. This alluvium has low potential to contain significant, non-renewable paleontological resources subject to adverse impact by development-related excavation, and so is assigned low paleontological sensitivity. However, this unit is typically thin and can overlie units of moderate or high paleontological sensitivity.

Alluvial Deposits of Palo Verde Mesa (Qpv) Pleistocene

The Alluvial Deposits of the Palo Verde Mesa have been mapped as Qpv and dated as Pleistocene in age (1.2 Ma - 10,000 years B.P., Stone 2006). No fossil resources have been recorded from this geologic unit within the Project area. Numerous vertebrate localities have been reported from Older Pleistocene alluvial sediments elsewhere in southern California, Arizona, and Sonora, Mexico. These Older Pleistocene alluvial sediments have been reported to yield significant fossils of extinct animals from the Ice Age (Jefferson 1991; Reynolds and Reynolds 1991; Woodburne 1991; Springer and Scott 1994; Scott 1997; Springer et al. 1999, 2007), as well as fossil plants (Reynolds and Reynolds 1991; Anderson et al. 2002). Fossils vertebrates recovered from these Pleistocene sediments represent extinct taxa including mammoths, mastodons, ground sloths, dire wolves, short-faced bears, saber-toothed cats, large and small horses, large and small camels, and bison (Jefferson 1991; Reynolds and Reynolds 1991; Woodburne 1991; Springer and Scott 1994; Scott 1997; Springer et al. 1998, 2007). This geologic unit is a PFYC Classification 3a (BLM 2012). Based on the PFYC Classification of 3A, the Qpv formation could have a low or high rating under the SVP rating system. Due to the numerous vertebrate fossils found in similar formations this geologic unit is considered to have a high paleontological sensitivity under SVP (1995) criteria.

Alluvial Fan and Alluvial Valley Deposits (Qa_6) late Pleistocene? to Holocene

Holocene-age Unit 6, is mapped by Stone (2006) as Qa_6. Stone (2006) assigns this unit an age of 100 to 2,000 years B.P. No fossil resources are known to exist within this geologic unit within the Project area.

Fossil vertebrate localities have been recorded from similar deposits north of the Project area (McLeod 2011). Whereas Qa6 is considered too young to contain fossilized material and is considered to have a low paleontological sensitivity at least at the surface, it overlies and is poorly distinguished from older units that are considered as having high potential for containing significant fossil resources; therefore, the paleontological sensitivity increases to high paleontological sensitivity with depth. This geologic unit is a PFYC Classification 2 (BLM 2012). Due to the lack of substantial fossil localities the Qa_6 geologic unit is considered to have a low paleontological sensitivity under SVP (1995) criteria.

Eolian Sand (Qs) Holocene

The active sand dune deposits are too young to contain fossilized remains. However, older sand dune deposits, frequently stabilized with vegetation, may contain scientifically vertebrate specimens (McLeod 2011). Therefore, sand dune deposits within the Project area are assigned a low to high paleontological sensitivity, increasing with depth. The McCoy Solar Energy Project EIS determined this geologic unit as a PFYC Classification 2. Due to the lack of substantial fossil localities the Qs geologic unit is considered to have a low paleontological sensitivity under SVP (1995) criteria.

Regulatory Framework

Federal

Antiquities Act of 1906

The Antiquities Act of 1906 is used as the basis for federal protection of paleontological resources on federal lands. The act authorizes the government to regulate the disturbance of objects of antiquity on federal lands unauthorized damage or removal of such objects through the responsible managing agency and to prosecute individuals responsible for the

Federal Land Management and Policy Act

The FLMPA defines significant fossils as: unique, rare or particularly well-preserved; an unusual assemblage of common fossils; being of high scientific interest; or providing important new data concerning (1) evolutionary trends, (2) development of biological communities, (3) interaction between or among organisms, (4) unusual or spectacular circumstances in the history of life, (5) or anatomical structure.

Paleontological Resources Preservation Act of 2009

The Paleontological Resources Preservation Act, Title VI, Subtitle D of the Omnibus Public Lands Act directs the Secretaries of the Interior and Agriculture to manage and protect paleontological resources on federal land using "scientific principles and expertise." The Paleontological Resources Preservation Act incorporates most of the recommendations of the report of the Secretary of the Interior entitled *Assessment of Fossil Management on Federal and Indian Lands* (BLM 2000) in order to formulate a consistent paleontological resources management framework. In passing the Paleontological Resources Preservation Act, Congress officially recognized the scientific importance of paleontological resources on some federal lands by declaring that fossils from these lands are federal property that must be preserved and protected. The Paleontological Resources Preservation Act codifies existing policies of the BLM, NPS, United States Forest Service (USFS), Bureau of Reclamation, and USFWS, and provides the following:

1) criminal and civil penalties for illegal sale and transport, and theft and vandalism of fossils from federal lands;
2) minimum requirements for paleontological resource-use permit issuance (terms, conditions, and qualifications of Applicant);
3) definitions for "paleontological resources" and "casual collecting"; and
4) requirements for curation of federal fossils in approved repositories.

Federal legislative protections for scientifically significant fossils apply to projects that take place on federal lands (with certain exceptions such as Department of Defense), involve federal funding, require a federal permit, or involve crossing state lines. Because a portion of gen-tie line for the proposed Project and Alternatives occurs on BLM-managed lands, federal protections for paleontological resources apply under NEPA and FLPMA.

Paleontological resources are also afforded federal protection under 40 CFR Part 1508.27 as a subset of scientific resources. The most explicit federal protection for paleontological resources, enacted in 2009, is the Paleontological Resources Preservation Act. This act regulates who may collect fossils on public lands and where such fossils must be curated. It also provides for prosecution of violators.

Potential Fossil Yield Classification System

Occurrences of paleontological resources are closely tied to the geologic units (i.e., formations, members, or beds) that contain them. The probability for finding paleontological resources can be broadly predicted from the geologic units present at or near the surface. Therefore, geologic mapping can be used for assessing the potential for the occurrence of paleontological resources.

The BLM uses the PFYC system, which classifies geologic units based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts, with a higher class number indicating a higher potential. This classification is applied to the geologic formation, member, or other distinguishable unit, preferably at the most detailed mappable level. It is not intended to be applied to specific paleontological localities or small areas within units. Although significant localities may occasionally occur in a geologic unit, a few widely scattered important fossils or localities do not necessarily indicate a higher class; instead, the relative abundance of significant localities is intended to be the major determinant for the class assignment.

State

Public Resources Code §5097.5

Public Resources Code §5097.5 includes additional state-level requirements for the assessment and management of paleontological resources, including the reasonable mitigation of adverse impacts to paleontological resources resulting from development on public lands (lands under state, county, city, or public district or agency ownership or jurisdiction). This regulation defines the removal of paleontological "sites" or "features" from public lands as a misdemeanor, and prohibits the removal of any paleontological "site" or "feature" from public land without permission of the applicable jurisdictional agency. These protections apply only to non-federal public lands within California, and thus apply only to the small portion of the gen-tie line that would be located on County-owned land.

Public Resources Code §30244

If paleontological resources would be adversely impacted as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required.

Local

Riverside County General Plan

The Multipurpose Open Space Element of the Riverside County General Plan identifies a number of policies intended to minimize impacts to paleontological resources. It also includes a Paleontological Sensitivity Resources map indicating lands with low, undetermined, or high potential for finding paleontological resources. The following policies apply to the portions of the Project site within County- and privately owned lands (Riverside County 2008):

OS 19.6: Whenever existing information indicates that a site proposed for development has high paleontological sensitivity as shown on Figure OS-7, a paleontological resource impact mitigation program shall be filed with the County Geologist. The paleontological resource impact mitigation program shall specify the steps to be taken to mitigate impacts to paleontological resources.

OS 19.7: Whenever existing information indicates that a site proposed for development has low paleontological sensitivity as shown on Figure OS-7, no direct mitigation is required unless a fossil is encountered during site development. Should a fossil be encountered, the County Geologist shall be notified and a paleontologist retained by the Applicant. The paleontologist shall document the extent and potential significance of the paleontological resources on the site and establish appropriate mitigation measures for further site development.

OS 19.8: Whenever existing information indicates that a site proposed for development has undetermined paleontological sensitivity as shown on Figure OS-7, a report shall be filed with the County Geologist documenting the extent and potential significance of the paleontological resources on-site and identifying mitigation measures for the fossil and for impacts to significant paleontological resources.

OS 19.9: This policy requires that when existing information indicates that a site proposed for development may contain paleontological resources, a paleontologist shall monitor grading activities with the authority to halt grading to collect uncovered paleontological resources, curate any resources collected with an appropriate repository, and file a report with the Planning Department documenting any paleontological resources that are found during the course of site grading.

3.2.13 Population, Housing, Public Services, Utilities, and Socioeconomics

This section describes the population and housing, public services and utilities, and social and demographic background and existing conditions in the area surrounding the Project area and Alternatives, including the City of Blythe and the Broader Eastern Riverside County and neighboring Imperial County California and La Paz County, Arizona. This section also addresses the provision of public services and utilities to the Project and presents the regulatory framework in regards to population, housing, public services, utilities, and socioeconomics and environmental justice; and presents information on population and housing, public services and utilities, and socioeconomic conditions in the Project area

Information in this section is based on data obtained from national and regional sources, including the United States Census Bureau, California Department of Finance (DOF), and the California Employment Development Department (EDD).

Environmental Setting

Project Area and Vicinity

The Project's solar facility site is located on approximately 3,587 acres of privately owned, undeveloped, and agricultural lands in eastern Riverside County; the gen-tie line corridor would occupy 73 acres of private and public lands. The Imperial County line is approximately 14 miles south of the Project area, and the Colorado River and the Arizona border are approximately nine miles to the east of the Project area. As illustrated in Figure 3.2.1-1, there are three residences within the solar facility site (one on APN 863-060-015 and two residences on APN 863-100-016).

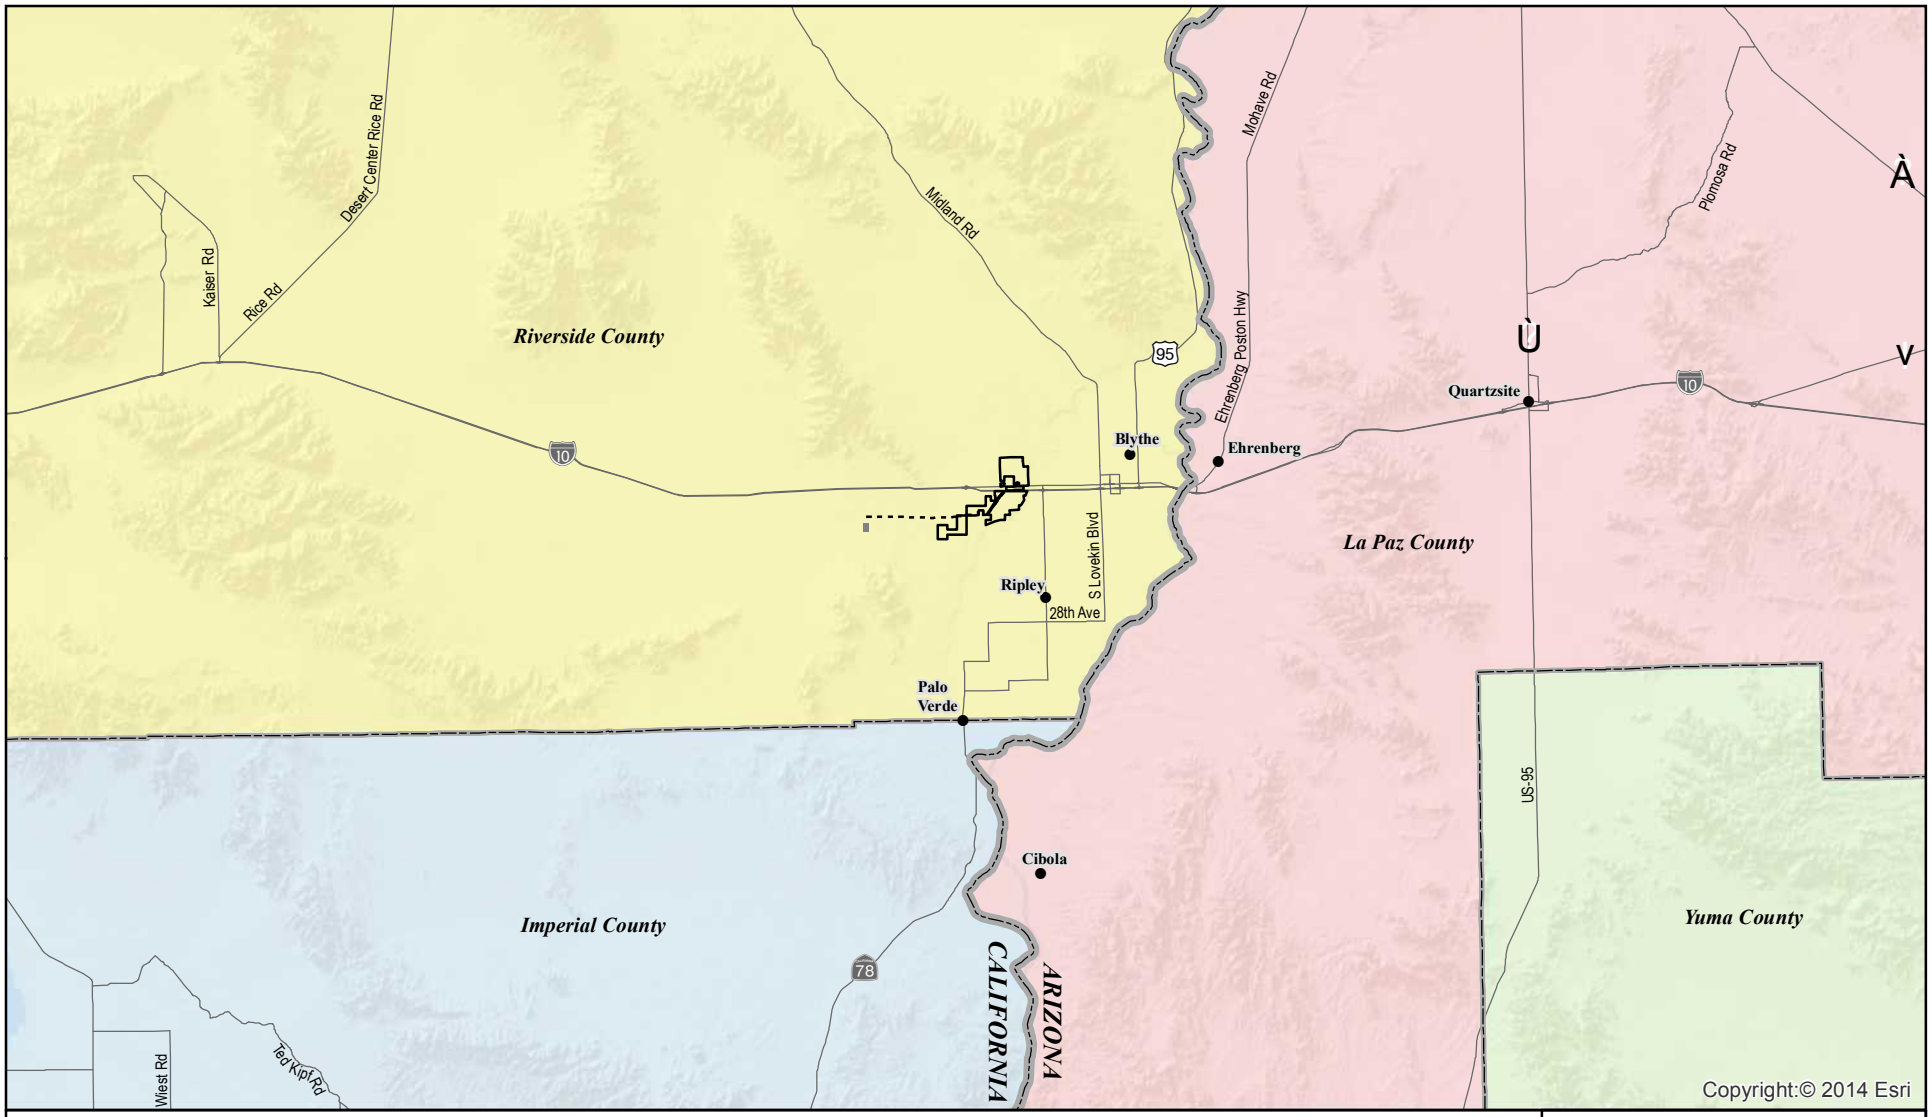
The expected source for the Project's construction workforce is the primary determinant of the affected social economic environment associated with the Project. The origin of Project workers likely would be a central factor determining the magnitude and extent of the Project's potential socioeconomic impacts to the local and regional economy and communities. Given the location of the Project area in eastern Riverside County, it is likely that most of the construction workforce would be derived from communities located in Riverside County, which has the largest concentration of construction workers in proximity to

the Project area. A smaller percentage of the workforce would be derived from Imperial County, California and La Paz County, Arizona.

For the purposes of this population and housing analysis, the "study area" is considered to be the counties within a hour commute from the Project area on mapped roads (federal, State, and local). There are four counties within an hour commute from the Project Area. Since the closest populated community in Yuma County is over an hour away, the study area only includes Riverside and Imperial Counties in California and La Paz County in Arizona (Figure 3.2.13-1). Local communities within an approximate one-hour commute from the proposed Project area are listed below; however, other communities within Riverside County were specifically evaluated as well, regardless of population, due to the County of Riverside's jurisdiction.

- Blythe, California - 5 miles east
- Palo Verde, California - 10 miles south
- Ripley , California - 10 miles south
- Cibola, California - 10 miles south
- Ehrenburg, Arizona -10.5 miles east
- Quartzite, Arizona - 27.5 miles east

For the purposes of this environmental justice screening, race, ethnic origin, and poverty status were obtained for the Project area and surrounding area, including the City of Blythe and the County of Riverside. The CEQ has oversight responsibility for the federal government's compliance. The CEQ, in consultation with the EPA and other agencies, has developed environmental justice guidance to assist federal agencies with NEPA administration. The guidelines suggest a demographic screening process analyze the census block group demographics within a six-mile radius around a proposed site, then determine if the population within this radius can be considered an "environmental justice population," i.e., if within that radius the population is greater than fifty percent minority or low income (CEQ 1997). The environmental justice study area is illustrates in Figure 3.2.13-2.



Population Characteristics

The Project is located in Riverside County, which is the fourth most populous county in California. According to the California DOF, the population in Riverside County grew from 1,545,387 in 2000 to 2,189,641 in 2010, which represents an annual growth rate of 4.17 percent. Riverside County grew at much faster rate than California as a whole. Between 2000 and 2010, Imperial, grew 2.3 percent.

Population growth in Riverside County is expected to slow during the next four decades. The growth rate is projected to be 3.3 percent annually from 2010 to 2020 and to fall to 2.1 percent from 2020 to 2030. The growth rate between 2030 and 2050 is projected to climb back up to 3.5 percent per year (California DOF 2010a, 2010b). The California DOF projections developed from 2010 to 2020 show that Riverside County will grow at a higher annual rate (3.3 percent) than the rate of California (1.3 percent), and at a rate second only to Imperial County (3.7 percent).

The cities in Riverside County that experienced the largest annual growth between 2000 and 2010 are Coachella, La Quinta, Indio, and Rancho Mirage, at 7.9, 5.8, 5.5, and 3.0 percent, respectively. The communities closest to the Project area grew at a much slower rate, such as the City of Blythe (0.17 percent growth) and Palo Verde (growth loss of 3.8 percent).

Population estimates, future projections, and average annual growth rates by county are summarized in Table 3.2.13-1. Table 3.2.13-2 illustrates the populations of the cities within the study area. Populations from 2000 and 2010 are listed with an average annual growth number and rate for the communities within the study area.

Housing Characteristics

Permanent Housing

The current occupied and vacant housing estimates and vacancy rates are presented for communities and counties within the study area in Table 3.2.13-3. Vacancy rates are high for the three counties, with a total of 128,339 vacant units. In 2010, Riverside County had 114,447 vacant units (14.3 percent), of which 63,909 (eight percent) are vacant and available and 50, 538 (six percent) are for seasonal, recreational, or occasional use. La Paz County in Arizona had 6. 951 vacant units (43 percent); however, 5,318 units (33 percent) are for seasonal, recreational, or occasional use. Due to the current economic downturn, the communities closest to the Project area (Blythe, Ripley, Cibola, Ehrenberg, and Quartzite) had very high vacancy rates in 2010, ranging from 17 to 56 percent, with a combined total of 3,835 vacant units.

Due to the current economic downturn, the communities closest to the Project area (Ripley, Blythe, Cibola, Ehrenberg, and Quartzite) had very high vacancy rates in 2010, ranging from 17.5 to 52.8.2 percent, with a combined total of 2,809 vacant units. The communities throughout the entire study area had vacancy rates ranging from 9.1 to 52.8 percent, with a total of 55,533 vacant units (see Table 3.2.13-3).

TABLE 3.2.13-3 2010 STUDY AREA HOUSING CHARACTERISTICS

TOTAL HOUSING UNITS		OCCUPIED HOUSING UNITS			VACANT HOUSING UNITS

Quartzsite town	3,378	2,027 (60%)	1,711	316	1,351 (40%)	1,097 (32%)

Sources: U.S. Census 2012
Notes: CCD is census county division.
CDP is census designated place.

In 2011, the City of Blythe had an estimated median household income of $41,892 and the State of California had median household income of $57,287 (City Data 2013). In 2011, the estimated median house or condo value for the City of Blythe was $130,281 and $355,600 for California (City Data 2013). For 2011, the median-gross rent in the City of Blythe was $696 (City Data 2013). For 2009, the median contract rent for the County of Riverside was $986 and $1058 for California (City Data 2013).

Temporary Housing Resources

Temporary housing in the Project area includes rental homes hotel and motel rooms, which are present throughout the study area and are typically concentrated in urban areas or near major transportation facilities. Other types of temporary housing units within the study area that may be used include campgrounds and recreational vehicle parks.

As shown in Table 3.2.13-3, the vacancy rates for seasonal, recreational, or occasional use rates for Riverside County and La Paz County are high, 50,338 vacant units (six percent) and 5,318 units (33 percent) respectively. With the additional of Imperial County's vacant seasonal, recreational, or occasional use units (2,060 units or 12 percent), there are a total of 57,916 vacant units. Within the local communities closes to the Project area, there are a total of 2,197 vacant seasonal, recreational, or occasional use units.

In the study area, 14 hotels and motels were identified with a total of 789 rooms. Twelve hotels and motels were identified in the Blythe, California with a total of at least 655 rooms (HotelGuides 2013); there are no other hotels or motels with 15 or more rooms within an hour drive from the Project area. One hotel was identified in Ehrenberg (approximately nine miles away) and one hotel in Parker, Arizona (approximately 42 miles away); they have 84 and 50 rooms respectively (HotelGuides 2013).

The BLM manages two long term visitor areas (LTVAs) that are located in the vicinity of the Project area: Midland LTVA and Mule Mountains LTVA. Both provide long-term camping opportunities. Two campgrounds are located within the boundaries of the Mule Mountains LTVA: Wiley's Well and Coon Hollow Campgrounds. Both are year-round facilities with campsites, picnic tables, grills, shade armadas, and handicapped-accessible vault toilets (BLM 2011b). For information regarding BLM managed recreational facilities, please refer to Section 3.2.14, *Recreation.*

Economy and Employment Characteristics

The 2010 employment statistics for Riverside and Imperial Counties and the State of California are listed in Table 3.2.13-4. The government is the largest employment sector for the State of California and Riverside and Imperial Counties, 17.0, 20.1, and 29 percent respectively. The construction sector contributed 36,000 employees (6.7 percent) for Riverside County and 1,300 employees (2.1 percent) for Imperial County, and 586,600 employees (4.1 percent) for California. Transportation, warehousing, and utilities sector contributed 19,500 employees (3.6 percent) in Riverside County and 10,300 employees (16.27 percent) in Imperial County, and 464,900 employees (3.3 percent) in California.

Notes: Data presented in this table is reflective of the total of this table.
(1) There is a slight margin of error due to rounding.

For Arizona, Table 3.2.13-5 lists the 2010 employment by industry sectors for La Paz, Yuma, and Maricopa Counties. The largest employment sector was the government at 44.8, 30.2, and 17.0 percent respectively. The construction sector contributed 242 employees (4.4 percent) of the employment. Transportation, warehousing, and utilities contributed 2.4 percent of the employment.

TABLE 3.2.13-5 2010 EMPLOYMENT BY INDUSTRY SECTORS FOR LA PAZ COUNTY, ARIZONA

Source: U.S. BEA 2009.
Notes: All numbers are current as of 2009.
(1) There is a very slight margin of error with percentages due to rounding.
(2) This number reflects construction only. Natural resources and mining numbers are not shown on the Bureau of Economic Analysis (BEA) table to avoid disclosure of confidential information; however, estimates for these items are included in the BEA totals (not included in this table).
(3) Utilities are not included in this number. This category of employment is estimated at less than 10 jobs, and therefore is not included. This category is included in totals on the BEA table, but not included on this table.

Tables 3.2.13-6, 3.2.13-7, 3.2.13-8 present a 10-year employment projection of new jobs by industry for the Riverside and Imperial Counties and State of California from 2008 to 2018. For the purposes of

employment projections, the California EDD groups Riverside and San Bernardino Counties as one statistical area; therefore, they are presented in Table 3.2.13-6 together. Employment by industry projections for California are included in Table 3.2.13-7, as well. Data for projected employment was not available for Arizona state or counties.

The highest number of new jobs projected for Riverside and San Bernardino Counties is in educational and health services, at a 22.8 percent increase. Construction and transportation, warehousing, and utilities sectors are projected to grow at 5 and 6.1 percent, respectively. The largest growth in California over this time period is anticipated to be in the educational and health services industry, at 24.5 percent, while transportation, warehousing, and utilities and construction are projected to grow by 8.1 and 9 percent, respectively.

TABLE 3.2.13-6 RIVERSIDE AND SAN BERNARDINO COUNTY INDUSTRY EMPLOYMENT PROJECTIONS

INDUSTRY	AVERAGE EMPLOYMENT		EMPLOYMENT CHANGE	
	2008	2018	Numerical	Percent
Agriculture	15,900	15,200	-700	-4.4

Public Services and Facilities

This subsection describes public services and facilities in the Project area, which includes education; law enforcement; fire protection; hazardous materials emergency response; parks and recreation; hospital facilities and emergency response; utilities; natural gas and electricity; water and wastewater; and solid waste.

Education

The solar array field is located within the Palo Verde Unified School District. Palo Verde Unified serves Blythe and other remote areas of Riverside County and consists of three elementary schools, two middle schools, one high school, and a continuation high school. Palo Verde Unified is the district with authority to assess school impact fees from the Project. Table 3.2.13-8 includes the schools and enrollment in Palo Verde Unified.

TABLE 3.2.13-8 SUMMARY OF SCHOOLS AND ENROLLMENT IN PALO VERDE UNIFIED SCHOOL DISTRICT, 2009 TO 2010

SCHOOL NAME	COMMUNITY	GRADES	LOCATION	STUDENTS
Felix J. Appleby Elementary School	Blythe	K – 6	401 S. Third Street	571
Margaret White Elementary School	Blythe	K – 6	610 N. Broadway	712
Ruth Brown Elementary School	Blythe	K – 6	241 N. Seventh Street	715
Blythe Middle School	Blythe	7 – 8	825 N. Lovekin Blvd.	562
Palo Verde Valley Community Day	Blythe	6 - 10	190 North Fifth Street	34
Palo Verde High School	Blythe	9 - 12	667 N. Lovekin Blvd.	927
Twin Palms Continuation	Blythe	9 - 12	811 West Chanslor Way	74

Source: National Center for Education Statistics 2011.

Law Enforcement

The City of Blythe and the Riverside County Sheriff's Department provide law enforcement and public safety to the solar facility. The City of Blythe Police Department (BPD) is located at 240 North Spring Street in Blythe and its service area covers all land in the City limits, which is approximately 27 square miles. The BPD service area is divided into a total of four beats. The Sheriff's Department services include traffic control and neighborhood policing, emergency calls, and crime prevention. The Riverside County Sherriff's Department's Colorado River Station at 260 North Spring Street in Blythe provides service from the community of Red Cloud to the west to the Arizona state line in the east, Imperial County line to the south, and San Bernardino County line to the north. Communities included in this service are Desert Center, Eagle Mountain, Blythe, Hayfield, Midland, Nicholls Warm Springs, Ripley, and the Colorado River area.

The BPD does not maintain a standard for emergency response times. However, BPD officers respond immediately to all emergency calls. Depending on the location of the officer at the time of the call, response times can range from one to ten minutes (City of Blythe 2007). According to the Riverside County Sheriff's Department, the average response time depends on the location of the deputies on call and the severity of the situation (Brightsource 2011).

The California Highway Patrol (CHP) is the primary law enforcement agency for state highways and roads. The nearest CHP station to the Project area (Blythe Station 660) is located at 430 S. Broadway in the City of Blythe. Services include law enforcement, traffic control, accident investigation, and the management of hazardous materials spill incidents.

Fire Protection

To the extent that off-site assistance is required, the City of Blythe Volunteer Fire Department and the Riverside County Fire Department (RCFD)/California Department of Forestry would provide fire protection to the solar array field. The Blythe Volunteer Fire Department station is located at 201 North Commercial Street and is staffed with a full-time fire marshal employed by the City Building Department and 35 trained, paid volunteers including a chief, assistant chief, and deputy chief. Equipment consists of one 50-foot telesquirt, four pumpers, one quick attack truck, one squad truck, and one command vehicle.

The Project area is located within the RCFD's East Desert Division, which encompasses the lower Coachella Valley, east to the Arizona state line. RCFD services include municipal and wildland fire protection and prevention services, pre-hospital emergency medical services including paramedics, hazardous materials response, and technical rescue services. There are two battalions, nine permanently staffed fire stations, and two all-volunteer fire stations. The nearest fire stations are within the jurisdiction of RCFD Battalion 8. These include the Blythe, Ripley, Blythe Air Base, River Bend, and Lake Tamarisk fire stations. The closest station to the proposed Project is Ripley Fire Station 44, on 13987 Main Street, approximately five miles away. This station has two firefighters and one certified paramedic. Ripley Fire Station 44 has one Type 1 fire engine and operates 24 hours per day, seven days a week.

The Project area falls within acceptable Total Response Time policy standards for an 'outlying' land use area based on its proximity to the nearest station (Station 45, Blythe Air Base, 17280 W. Hobson Way, Blythe, CA 92225) and that station's ability to meet the seventeen minute and 30 second response time standard. Additionally, the solar facility site is in close proximity to the City of Blythe Volunteer Fire Department.

Other nearby fire stations are Blythe Air Base Fire Station 45, Blythe Fire Station 43, River Bend Fire Station 46 (volunteer only), and Lake Tamarisk Fire Station 49 in Desert Center. Each of these fire stations has one Type 1 fire engine and provides paramedic services. Each of these fire stations has three personnel (two firefighters and one certified paramedic), with the exception of Lake Tamarisk, which has four personnel (two firefighters and two certified paramedics). The River Bend volunteer station is a reserve volunteer station and does not operate 24 hours per day, seven days a week. This station provides reserve personnel in case of an emergency but does not respond directly to an emergency. All stations are dispatched by California Department of Forestry and Fire Protection (CAL FIRE) Riverside Unit/RCFD Emergency Command Center under the integrated Fire Protection System (Brightsource 2011).

Hazardous Materials Emergency Response

The Riverside County Hazardous Materials Management Division under the Department of Environmental Health is the CUPA, with three participating agencies: Banning Fire Department, Corona Fire Department, and the RCFD. The CUPA Program conducts inspections of businesses that handle hazardous materials, generate hazardous waste, treat hazardous waste, and/or maintain underground storage tanks. RCFD would handle the response to emergency releases of hazardous material or waste for the Project. The closest RCFD Hazardous Materials Response Team (Station 81) is located at 37995 Washington Street in Palm Desert, California. Station 81 will respond with one Hazardous Materials Response Unit staffed with three personnel and one Hazardous Materials Support Unit staffed with two personnel. One member of the five-person team is a certified paramedic.

Parks and Recreation

As discussed in greater detail in Section 3.2.14, *Recreation*, the BLM CDCA Plan allows recreational use of BLM public lands in the vicinity of the Project area, which includes seven wilderness areas, seven LTVAs, and the Bradshaw Trail. Wilderness areas are popular for vehicle camping along roads that are adjacent to the wilderness areas. RV camping near wilderness areas, with associated hiking, OHV use, photography, sightseeing, etc. accounts for up to 2,000 visitors per year (BLM 2011). The LTVAs accommodate visitors who wish to camp for as long as seven consecutive months.

Most of the Project area is in agricultural uses and none of it is designated for active recreational use. The Mesa Verde Park, just south of the Nicholls Warm Springs/Mesa Verde residential area, is approximately 0.4 mile (2,200 feet) from the proposed solar array field. Other nearby park facilities to the proposed solar array field are located within the major developed portion of the City of Blythe, located approximately five miles east of the solar array field. The City of Blythe Parks Department is responsible for the maintenance and upkeep of the area's seven parks and one pocket park (City of Blythe 2011). Please refer to Section 3.2.13 for a detailed discussion on recreation.

Hospital Facilities and Emergency Response

There are several hospitals / medical facilities that provide medical services to the vicinity of the Project area. Table 3.2.13-12 below provides a summary of the following hospitals that provide medical services in eastern Riverside County, including the Project area. Desert Regional Medical Center is the closest trauma care center to the Project area and the only trauma center in the Coachella Valley. It is a Level II trauma center and provides a full range of specialists and services available 24 hours a day. Palo Verde Hospital provides intensive care services.

The CHP's Border Division Air Operations Unit, located at the Thermal California Station, may respond to a traumatic injury occurring in the Project area that requires medical evacuation via helicopter. However, the CHP usually covers Medevac situations in the area surrounding Palm Springs and rarely in the Blythe area. There are a number of additional Medevac companies that service the Project area. If a serious emergency medical incident were to occur at the solar array field, the paramedic or first responder would call in the emergency. Based on rotation and proximity, a Medevac service would be dispatched to the solar array field for evacuation to Desert Regional Medical Center in Palm Springs. The companies that provide Medevac services to the Project area are Merci Air Service, Reach Helicopter, Care Flight, and the CHP.

Blythe Ambulance, located at 129 South 1st Street in Blythe, also provides emergency medical response services in the Project area. This facility is located approximately seven miles east of the Project area.

TABLE 3.2.13-12 HOSPITALS AND CLINICS SERVING THE PROJECT AREA

FACILITY	APPROXIMATE DISTANCE FROM PROJECT AREA	SERVICES
Palo Verde Hospital 250 North First Street Blythe, California 92225	7 miles northeast	Hospital, blood bank, computerized tomography scan, intensive care unit, labor/delivery/recovery rooms, magnetic resonance imaging, nuclear medicine, outpatient services, ultrasound.
La Paz Medical Services 150 East Tyson Road Quartzsite, AZ 85359	30 miles east	General medical services and treatments.
John F. Kennedy Memorial Hospital 47111 Monroe Street Indio, CA 92201	85 miles west	Hospital, cardiac and vascular, orthopedics and JFK Bone and Joint Institute, obstetrics, outpatient rehabilitation, women and children, emergency department, emergency and express care.
Desert Regional Medical Center 1150 N. Indian Canyon Drive Palm Springs, CA 92262	105 miles west	Hospital, comprehensive cancer center, inpatient rehabilitation, institute of orthopedics and neurosciences, women and infants center, wound center, hospice, surgery, emergency/trauma services, cardiac/heart care, anesthesiologists, and physical therapists.

Utilities

A variety of purveyors in Riverside County and the City of Blythe provide and maintain utility and service system facilities associated with electricity, water, solid waste, and natural gas. Underground Service Alert (also known as USA or "Dig Alert"), a non-profit organization supported by utility firms, provides specific information on the location of underground utilities to contractors upon request, prior to ground-disturbing construction activities.

Natural Gas and Electricity

Southern California Gas Company (SCGC) provides gas service to the City of Blythe and surrounding Riverside County. SCGC's service territory encompasses approximately 20,000 square miles in diverse terrain throughout Central and Southern California, from Visalia to the Mexican border (SCGC 2012).

Southern California Edison (SCE) provides electric service to residences and businesses in the City of Blythe and surrounding area. Currently, SCE has transmission lines ranging from 500 kV to local distribution service lines of 12 kV. A major 500 kV transmission corridor passes through Palo Verde Valley and connects the Southern California market with generating plants located in Blythe and in the state of Arizona.

Water and Wastewater

The water supplies used for the Project area's agricultural irrigation and the water supplies underlying the Project area (Palo Verde Mesa Groundwater Basin), are under the jurisdiction of the PVID. Colorado River water, supplied through PVID canals, is lifted onto the mesa by private pumps to irrigate a portion of the acreage in the PVID. The remaining mesa irrigated acreage is irrigated from deep wells developed by the landowners. However, there are no wells supporting agricultural operations on the Project area.

A portion of the Project is within the City of Blythe. The City currently provides nearly 3,300 water service connections to customers, which are located within the City's municipal boundaries. The City consists of four individual water systems: City of Blythe proper water system, Mesa Bluffs water system, Hidden Beaches water system, and East Blythe County water district. Some rural residences with the City's corporate boundary obtain their water from private wells, as could be the case for rural residences in the Project area (Blythe General Plan 2007). The City's water supply is dependent upon a part of the Colorado River entitlement of the PVID. The City of Blythe lies entirely within the PVID, and the City's water use is almost entirely accounted for as a part of PVID's water use. PVID's water supply is unique in California. The District holds the Priority 1 rights to California's share of Colorado River water, and a shared portion of the Priority 3 rights, and their rights are not quantified by volume. Rather, their water rights are for irrigation and potable water needed to serve a total of 131,298 acres in the Palo Verde Valley, 26,798 of which are on the Palo Verde Mesa (PVID 2012). The great majority of water for the proposed Project (i.e., all of the non-potable water) would not be delivered by a public water system or using public water system connections. The proposed Project would use existing water infrastructure that currently delivers irrigation water from the PVID. Riverside County Community Service Area #122 (CSA #122) has substantiated its intention to provide this potable supply by issuing a will-serve letter (October 26, 2012 c/o Steve H. Jones – Manager) for the Project's limited potable water needs. CSA #122 has provided a will-serve letter for the small amount (up to 150 gallons per day) of potable water for the two O&M buildings.

The City of Blythe owns and operates the Regional Wastewater Reclamation Facility, a Class III Facility, located at 15901 South Broadway in the City of Blythe. The City also owns a sewage collection, treatment, and disposal system that provide sewage services to the City. The facility treats approximately 1.3 million gallons per day of Dry Weather Flow. The facility is permitted to discharge up to 2.4 million gallons per day of treated wastewater to percolation / evaporation ponds (City of Blythe 2012a).

On-site Wastewater Treatment Systems or Advanced Treatment Units would be installed to treat domestic sewage (non-hazardous liquid waste) from the operation and maintenance buildings on-site. Prior to the issuance of a building permit, the Project shall be required to obtain permit approval from Department of Environmental Health to install an On-site Wastewater Treatment System or Advanced Treatment Unit. Additional soils percolation testing shall be required at time of building plan check submittal.

Solid Waste

The Riverside County Waste Management Department operates seven landfills, seven transfer stations, and a grinding facility within the County. The nearest landfills that serve the Project area include the Blythe Landfill at 1000 Midland Road, which is approximately 10 miles away, and Desert Center Landfill at 17-991 Kaiser Road in Desert Center, which is approximately 60 miles away (Riverside County Waste Management Department 2012). The City of Blythe contracts with Palo Verde Valley Disposal for waste and recycling needs (City of Blythe 2012b).

Environmental Justice

The environmental justice analysis discusses the populations residing in census tracts 459, 461.01, 461.02, 461.03, 462, 469, 470, and 9810 (see Figure 3.2.13-2). The City of Blythe is located on the eastern portion of the study area. The Census tracts are small, relatively permanent statistical subdivisions of a county.

Table 3.2.13-13 presents the minority population composition of the study area, the City of Blythe, and Riverside County as a whole[6]. Riverside County as a whole exhibits a proportion of minority residents of 49 percent, which is higher than the City of Blythe and tracts 461.02 and 462, but higher than tracts 459, 461.01, 461.03, 469, 470, and 9810. Block Group 470, which is located to the northeast of the proposed Project, has a very low population and a small percentage of minority residents.

TABLE 3.2.13-13 ENVIRONMENTAL JUSTICE CHARACTERISTICS

GEOGRAPHIC AREA (CENSUS TRACTS)	TOTAL POPULATION	TOTAL MINORITY (PERCENTAGE MINORITY)	MEDIAN HOUSEHOLD INCOME (2010)	PROPORTION OF THE POPULATION LIVING BELOW THE POVERTY LEVEL (PERCENTAGE LOW INCOME)
459	1,838	683 (37%)	$46,742	23%
461.01	3,060	1,334 (44%)	$56,667	8%
461.02	2,027	1,169 (58%)	$24,613	26%
461.03	3,030	1,175 (39%)	$66,029	10%
462	3,341	1,845 (55%)	$42,824	16%
469	2,043	743 (36%)	$41,250	21%
470	1,749	562 (32%)	$34,304	6%
9810(1)	7,634	2,303 (30%)	NA	NA
City of Blythe	**20,817**	**8,421 (41%)**	**$41,856**	**16.8%**
Riverside County	**2,189,641**	**854,494 (49%)**	**$57,768**	**13.4%**

Source: U.S. Census Bureau 2000.
(1) Ironwood State Prison.

As indicated in Table 3.2.13-13, the total population of the eight tracts within a six-mile radius of the Project is 17,088 (excluding tract 9810, which encompasses Ironwood State Prison and has a total population of 7,634), of which 7,511 are classified as Black or African-American, Native American (or Alaskan Native), Asian, Native Hawaiian (or other Pacific Islander), some other race (including two or more races), and/or Hispanic or Latino.

The 2010 census data reported that the median household income for Riverside County was $57,768. The median household income for Riverside County is higher than all of the eight census tracts within the six-mile radius of the solar facility and the City of Blythe; except tract 461.03 that has the highest median household income ($66,029) which is located southeast of the solar facility on the northern side of Blythe.

[6] According to the U.S. Census Bureau, "minority" is defined as all persons except non-Hispanic whites. In other words, *minority* is defined as all racial groups other than white, and all persons of Hispanic origin, regardless of race.

Census tract 461.02 has the lowest median household income (at $24,613) and Census tract 461.02 has the highest proportion of residents below the poverty level (26 percent).

Regulatory Framework

Federal

National Environmental Policy Act of 1969

NEPA establishes a public, interdisciplinary framework for federal agencies reviewing projects under their jurisdiction to consider environmental impacts. NEPA's basic policy is to ensure that all branches of government give proper consideration to the environment prior to undertaking any major federal action that significantly affects the environment.

The BLM is responsible for preparation of an EA in compliance with NEPA to evaluate the environmental impacts of the portions of the Project on federal lands. The Project gen-tie line is located on lands administered and managed by the BLM. NEPA compliance is required for this portion of the Project through preparation of a Draft and Final EA. BLM is also responsible for Native American consultation, including government-to-government consultation.

The President's CEQ developed guidelines and procedures to assist federal agencies with NEPA procedures so that environmental justice concerns are effectively identified and addressed. This includes guidelines for public participation, alternatives, and mitigation.

Executive Order 12898

Executive Order 12898 and the President's February 11, 1994 Memorandum on Environmental Justice (sent to the heads of all departments and agencies) are intended to ensure that federal departments and agencies identify and address disproportionately high and adverse human health or environmental effects of their policies, programs, and activities on minority populations and low-income populations. This consideration extends to permits issued by federal agencies. Because the Project would require federal agency approval (ROW grant from the BLM), the Executive Order applies to the Project.

Civil Rights Act of 1964, Public Law 88-352, 78 Stat. 241

Title VI of the Civil Rights Act of 1964 prohibits discrimination on the basis of race, color, or national origin by all federal agencies or activities receiving federal financial assistance. The Project would require federal agency approval (i.e., a ROW grant from the BLM) and, therefore, would require compliance with the Civil Rights Act.

State

California Revenue and Taxation Code § 73

California Revenue and Taxation Code § 73 allows property tax exclusion for certain types of solar energy systems installed before December 31, 2016. This section was amended in 2008 to include exemptions for active solar energy systems incorporated by an owner-builder in the initial construction of a new building that the owner-builder does not intend to occupy or use. Qualifying active solar energy systems are defined as those that are thermally isolated from living space or any other area where the energy is used, to provide for the collection, storage, or distribution of solar energy. These include solar space conditioning systems, solar water heating systems, active solar energy systems, solar process heating systems, photovoltaic systems, solar thermal electric systems, and solar mechanical energy.

Components included under the exclusion include storage devices, power conditioning equipment, transfer equipment, and parts. Pipes and ducts that are used to carry both solar energy and energy derived from other sources qualify for the exemption only to the extent of 75 percent of their full cash

value. Likewise, dual-use equipment for solar-electric systems qualifies for the exclusion only to the extent of 75 percent of its value.

Assembly Bill X1 15, signed by the California governor in June 2011, modified and extended existing state law excluding an "active solar energy system" from calculation of cash value subject to property taxation. An active solar energy system includes PV panels, inverters, and other improvements necessary to deliver electric power for transmission or final use. The exclusion applies to new systems constructed prior to January 1, 2017, and remains in effect until a change in ownership occurs (California State Board of Equalization 2012).

Education Code §17620

Education Code § 17620 allows a school district to levy a fee, charge, dedication, or other requirement against any construction within the boundaries of the district for the purpose of funding construction or reconstruction of school facilities, provided the district can show justification for the fees. California Government Code (GC) §65995 limits the fee to a statutory fee unless a school district conducts a Facility Needs Assessment (GC §65995.6) and meets certain conditions. The administering agent implementing school impact fees for the Project is the Palo Verde Unified School District.

California Government Code §§ 65995-65998 (amended by State Bill 50)

California GC §§ 65995-65998 limits fees, charges, dedications, or other requirements for the construction or reconstruction of school facilities. State Bill 50, adopted in 1998, imposed limitations on the power of cities and counties to require mitigation of school facilities impacts as a condition of approving new development. In the case of industrial construction, the amount of fees and/or charges levied under Education Code § 17620 with support of a Facilities Needs Assessment may not exceed $0.31 per square foot of covered, enclosed space. Development of the Project may require school impact fees.

Title 14 California Code of Regulations § 15131

The regulations implementing CEQA state that economic or social factors of a project may be included in a CEQA document but shall not be treated as significant effects on the environment. However, economic or social effects of a project may be used to determine the significance of physical changes caused by the Project. Additionally, economic, social, and housing factors should be considered by public agencies together with technological and environmental factors in deciding whether changes in a project are feasible to reduce or avoid the significant effects on the environment.

Local

Riverside County General Plan

The Riverside County General Plan does not have an element that specifically addresses public services and utilities. However, the Plan addresses safety issues through the Safety Element. Issues addressing open space and land use are discussed in the Plan's Multipurpose Open Space Element and the Land Use Element (LU) and include:

Land Use Element

Policy LU 5.1. *Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, transportation systems, and fire/police/medical services.*

Riverside County Ordinance No. 659

This ordinance creates development impact fees "in order to effectively implement the Riverside County Comprehensive General Plan, manage new residential, commercial, and industrial development, and address impacts caused by such development" by providing funds for the construction of new or expanded public service facilities and open space.

City of Blythe General Plan

The General Plan addresses citywide concerns about growth and conservation, as well as safety. As the principal urban center in Palo Verde Valley, the plan emphasizes retaining the scale and character of existing neighborhoods. The City of Blythe Housing Element describes the housing needs and sets forth goals and implementation measures to address the identified housing needs; however, it does not contain any goals, policies or objectives related to population and housing that are relevant to the Project. Topics such as resource management, economic development, community design, affordable housing, safety, noise, and community services are included because they all have physical and environmental implications that are critical to the creation of a sustainable community.

Safety Element

Policy 8. *Cooperate with the City of Blythe Fire Department, Riverside County Department and the California Department of Forestry in periodically evaluating services and service criteria to ensure that the City continues to receive adequate fire protection and prevention services.*

Policy 9. *Coordinate with the City's Traffic Safety Committee in assessing the impact of incremental increase in development and traffic congestion on fire hazards and emergency response time.*

Policy 10. *Require new developments to install fire protection equipment/system.*

Policy 11. *Require new developments to pay for increased fire protection as necessitated by a particular development.*

Policy 12. *Continue to support the Fire Department's coordination with surrounding departments to provide fire protection services.*

Policy 13. *Enforce policies to protect the public-s safety from urban and wild-land fires.*

3.2.14 Recreation

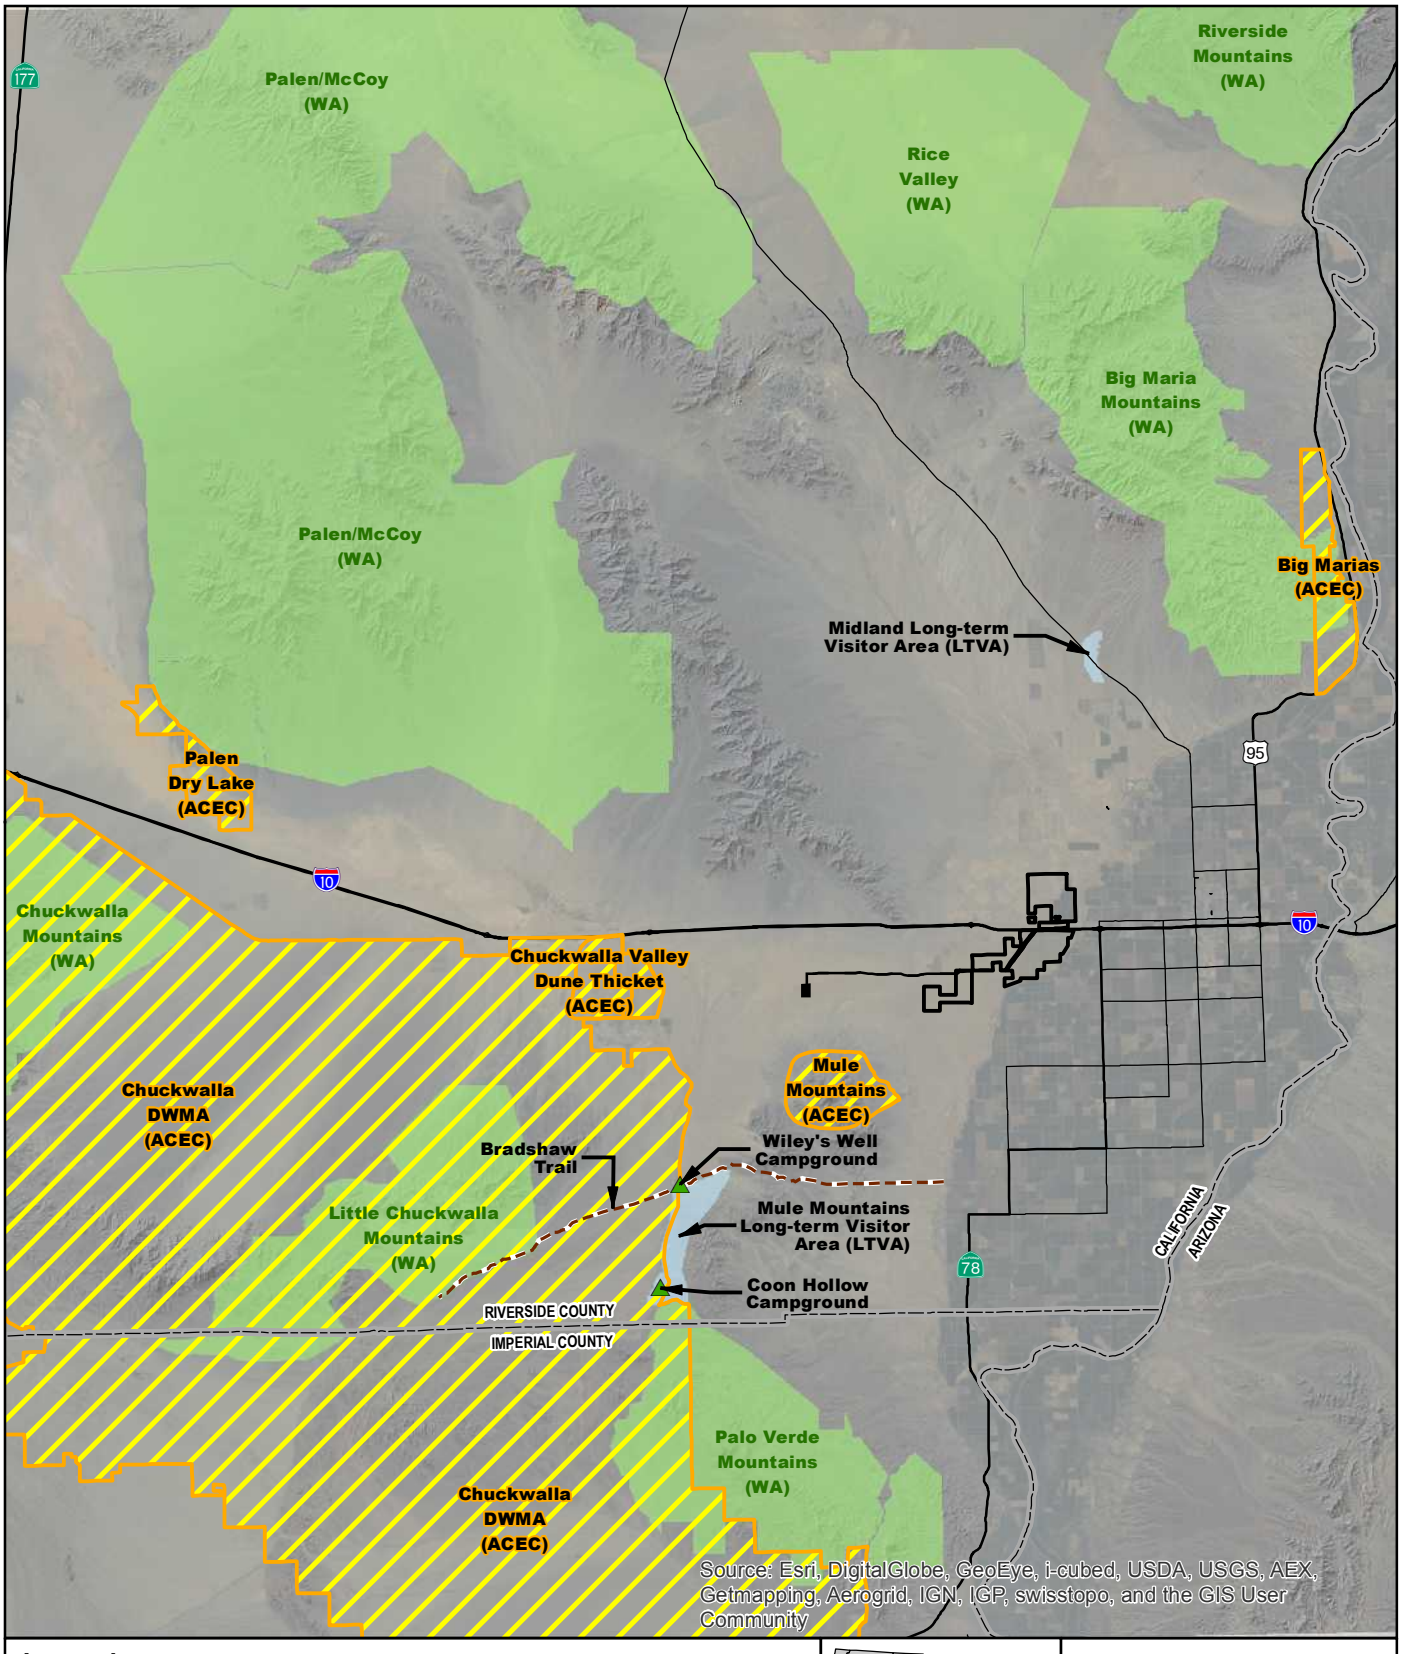
This section describes the environmental setting and regulatory framework in regards to recreational resources for the proposed Project and Alternatives.

Environmental Setting

Regional Setting

BLM-Administered Recreation Resources

For BLM-managed lands, the CDCA Plan and the NECO Plan Amendment govern the types of recreational uses. The portion of the Project area that lies within BLM-managed lands is designated in the CDCA Plan as Multiple-Use Class M (Moderate Use), which provides for a wide variety of present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Given the desert's vast expanse and great distances to recreation sites, it is difficult, if not impossible, in many circumstances, to engage in recreational activities in this region without employing a motorized vehicle in some fashion. In accordance with the CDCA Plan, motorized-vehicle access would be managed with Multiple-Use Class guidelines. Vehicle access in Multiple-Use Class M areas would be allowed on existing routes unless it is determined that use must be further limited. Designated Class L lands are located approximately 1.5 miles from the Project area. These lands are suitable for recreation activities



that generally involve low to moderate user densities, including backpacking, primitive unimproved site camping, hiking, horseback riding, rockhounding, nature study and observation, photography and painting, rock climbing, spelunking, hunting, landsailing on dry lakes, noncompetitive vehicle touring, mountain and trail biking, and events only on "approved" routes of travel (BLM 1980 and 2002). Stopping, parking, and vehicle camping are allowed to occur within 300 feet of a route, except within sensitive areas such as ACECs, where the limit is 100 feet (BLM 2002). Trails are open for non-vehicular use and new trails for non-motorized access may be allowed (BLM 1980).

The BLM administers wilderness areas, LTVAs, ACECs, and other recreational opportunities in the vicinity of the Project, which are listed in Table 3.2.14-1 and illustrated in Figure 3.2.14-1. ACECs and wilderness also provide dispersed recreation opportunities in the region. Overall, recreation use on BLM lands in the vicinity of the Project is limited to the cooler months of September through May, with little or no use in the summer. Popular recreation activities include car and recreational vehicle (RV) camping, OHV riding and touring, hiking, photography, hunting (dove, quail, deer), sightseeing, and visiting cultural sites. Outside of fee collection sites, the BLM has no accurate estimates of visitor use, but staff observations and ranger patrols indicate the area described in this section receives 2,000 to 3,000 visitors per year (BLM 2011a). Local residents and long-term winter visitors make up the majority of the use.

THIS PAGE INTENTIONALLY LEFT BLANK

Wilderness Areas

Seven wilderness areas are located in the vicinity of the Project: the Palen-McCoy Wilderness, Big Maria Mountains Wilderness, Little Chuckwalla Mountains Wilderness, Palo Verde Mountains Wilderness, Rice Valley Wilderness, Chuckwalla Mountains Wilderness, and Riverside Mountains Wilderness. The Wilderness Act limits allowable types of recreation on wilderness lands to those that are primitive and unconfined, depend on a wilderness setting, and do not degrade the wilderness character of the area. Motorized or mechanized vehicles or equipment are not permitted in wilderness. The BLM regulates such recreation on such lands within its jurisdiction in accordance with the policies, procedures and technologies set forth in 43 CFR Part 6300), BLM Manual 8560 (Management of Designated Wilderness Areas) (BLM 1983), BLM Handbook H-8560-1 (Management of Designated Wilderness Areas) (BLM 1988), and BLM's Principles for Wilderness Management in the California Desert (BLM 1995). More specifically, camping, hiking, rockhounding, hunting, fishing, non-commercial trapping, backpacking, climbing, and horseback riding are permissible (BLM 1988, 1983).

The seven wilderness areas in the vicinity of the Project have no developed trails, parking/trailheads, or other visitor use facilities. These areas are generally steep, rugged mountains, with no permanent natural water sources, thus limiting extensive hiking or backpacking opportunities. Visitor use within the wilderness areas is very light, though BLM has no visitor use counts. Observations by staff and Law Enforcement Rangers indicate only 100 to 200 hikers per year within each of the wilderness areas (BLM 2011a). More popular is vehicle camping along roads that are adjacent to the wilderness areas. RV camping near wilderness areas, with associated hiking, OHV use, photography, sightseeing, etc. accounts for up to 2,000 visitors per year (BLM 2011a).

Long Term Visitor Areas

The BLM manages LTVAs, which accommodate visitors who wish to camp for as long as seven consecutive months. Winter visitors who wish to stay in an LTVA must purchase either a long-term permit for $180 that is valid for the entire season or any part of the season (which runs from September 15 through April 15), or a short visit permit for $40 that is valid for 14 consecutive days. Permit holders may move from one LTVA to another within the permitted timeframe without incurring additional fees. Activities in and use of LTVAs are regulated by the rules of conduct set forth in 43 CFR subpart 8365 and the more than 30 supplemental rules that the BLM has determined are necessary to provide for public safety and health and to reduce the potential damage to natural and cultural resources of the public lands.

Two LTVAs are located in the vicinity of the Project area: Midland LTVA and Mule Mountains LTVA. Both provide long-term camping opportunities. In addition to long-term camping, recreational opportunities at LTVAs include hiking; OHV use; rockhounding; viewing cultural sites, wildlife, and unique desert scenery; and solitude (BLM 2011b and 2012; Wildernet 2011). By contrast, the landing or take-off of aircraft, including ultra-lights and hot air balloons, is prohibited in LTVAs (BLM 2012).

Two campgrounds are located within the boundaries of the Mule Mountains LTVA: Wiley's Well and Coon Hollow Campgrounds. Both are year-round facilities with campsites, picnic tables, grills, shade armadas, and handicapped-accessible vault toilets (BLM 2011b).

Areas of Critical Environmental Concern

Five ACECs are within 20 miles of the Project area: Mule Mountains, Chuckwalla Valley Dune Thicket, Chuckwalla Desert Wildlife Management Area, Big Marias, and Palen Dry Lake. Recreation activities allowed in ACECs are determined by the resources and values for which the ACECs were established, and by the associated ACEC Management Plan. Most ACECs allow low-intensity recreation use that is compatible with protection of the relevant values.

Mule Mountains ACEC primarily protects cultural resources. The Chuckwalla Desert Wildlife Management Area was designated to protect desert tortoise and significant natural resources. Chuckwalla Valley Dune Thicket and Palen Dry Lake ACECs protect both natural and cultural resources. These ACECs do not have recreation use facilities, but have signage to inform visitors of the special values of the areas and

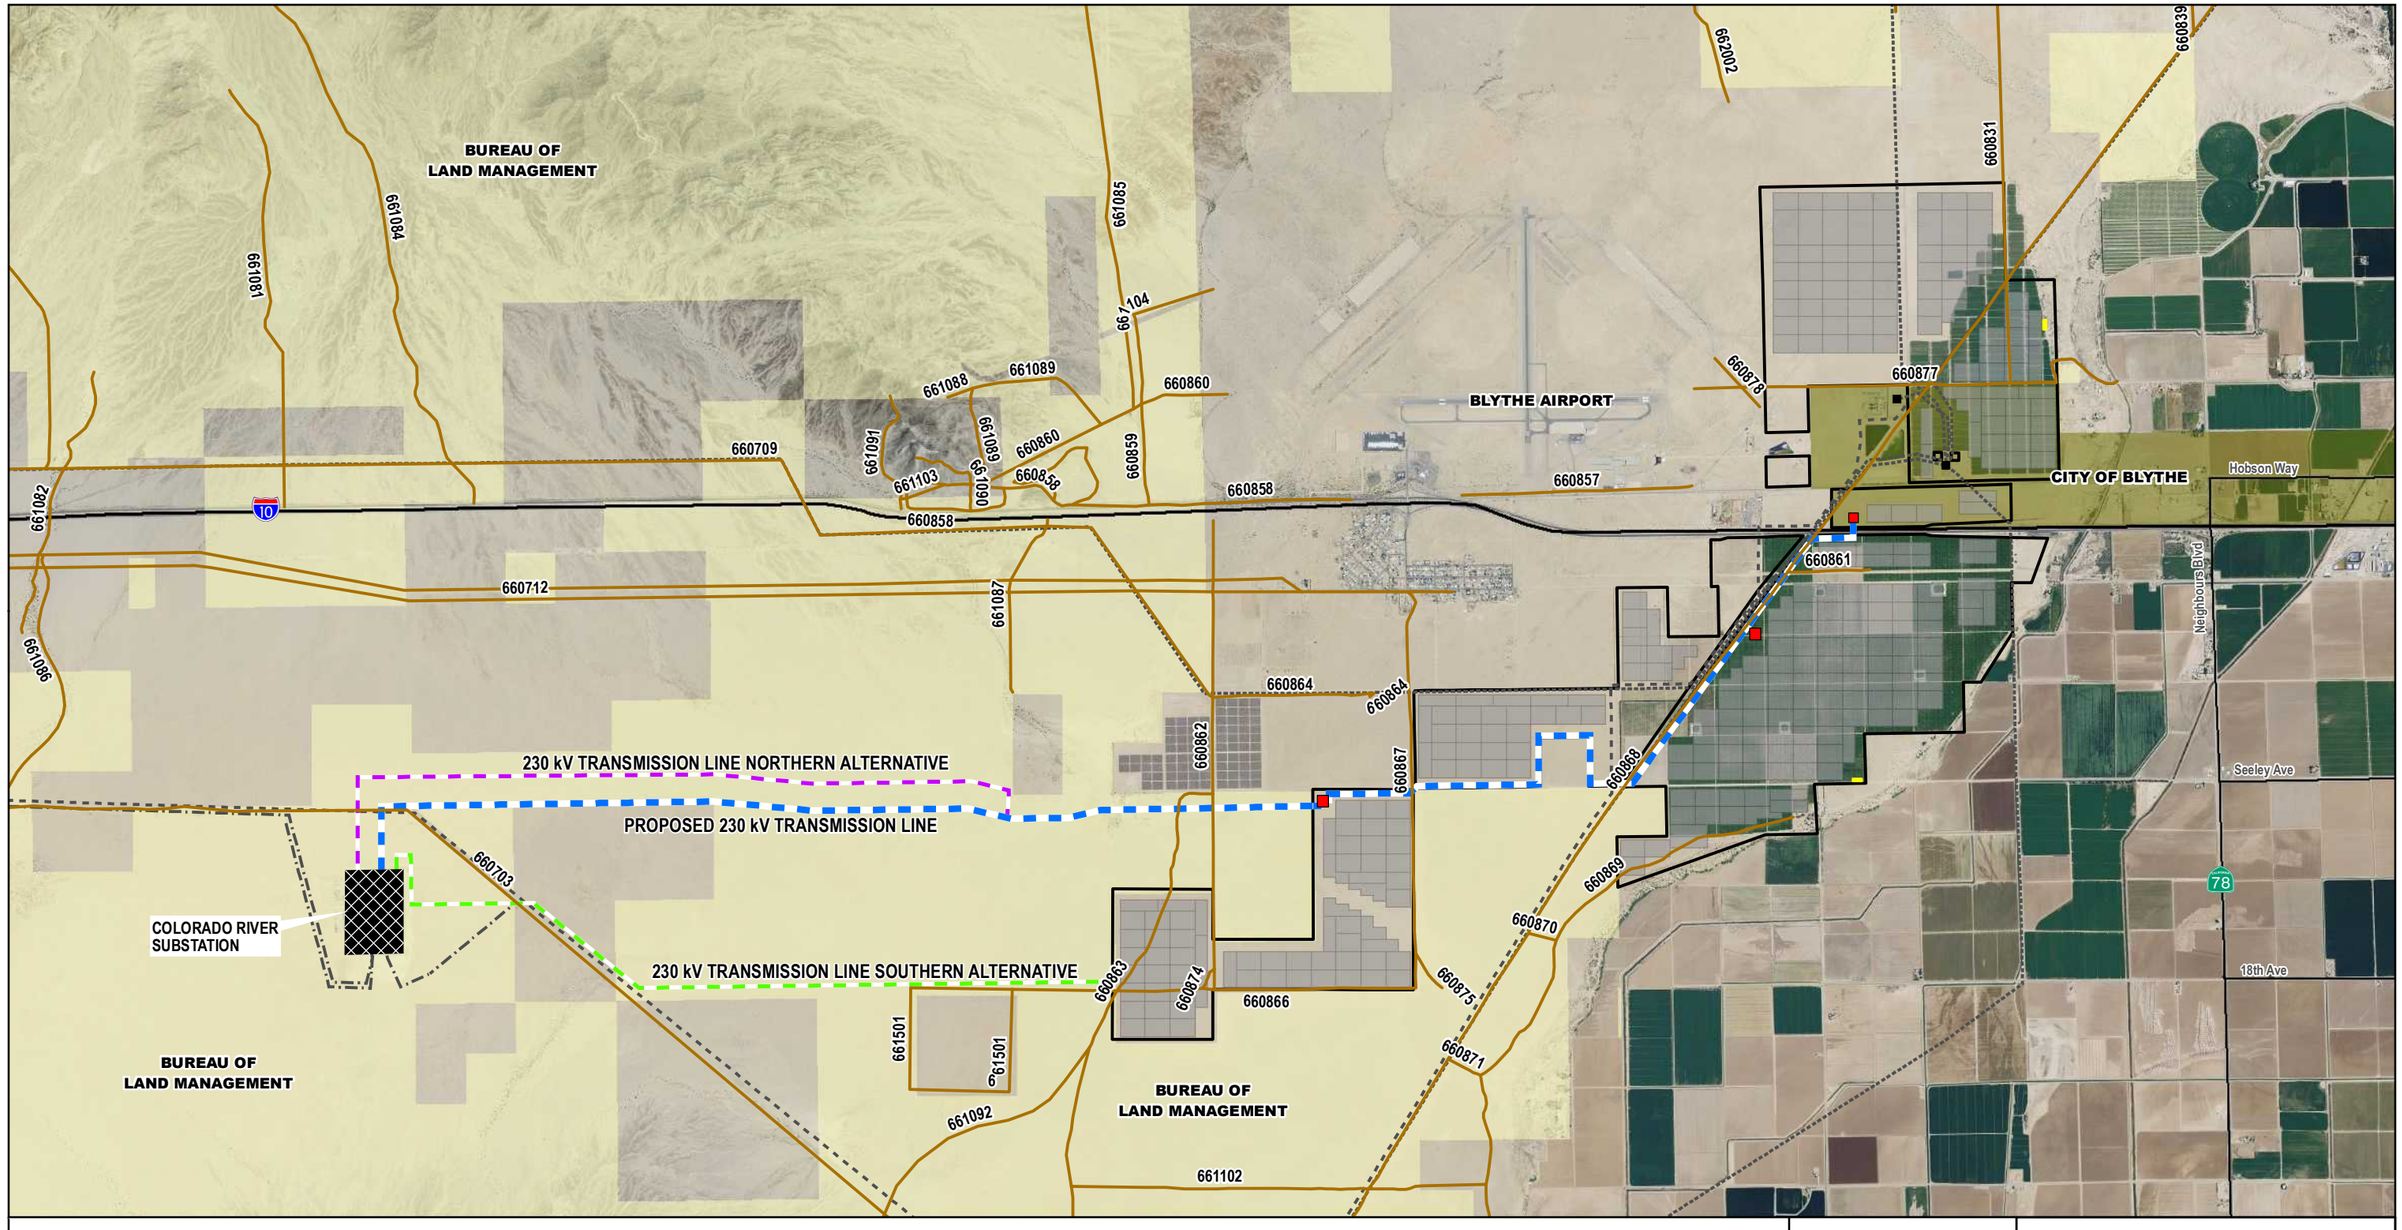
associated protection measures. BLM has no visitor counts for these sites, but observations and patrols indicate very low use, in the hundreds per year (BLM 2011a).

The Bradshaw Trail

The BLM-administered portion of the Bradshaw Trail is a 65-mile Back Country Byway that begins about 35 miles southeast of Indio, California and ends about 15 miles southwest of Blythe (BLM 2011c). The Riverside County PVVAP Trails and Bikeway map shows a route for the Bradshaw Trail that continues east of this location through Blythe to the Colorado River (Riverside County 2010). The trail was the first road through Riverside County, created by William Bradshaw in 1862 as an overland stage route beginning in San Bernardino, California, and ending at Ehrenberg, Arizona. The trail was used extensively between 1862 and 1877 to transport miners and passengers. The trail is a graded dirt road that traverses mostly public land between the Chuckwalla Mountains and the Chocolate Mountain Aerial Gunnery Range. Recreational opportunities include four-wheel driving, wildlife viewing, plant viewing, birdwatching, scenic drives, rockhounding, and hiking (BLM 2011c).

Public Access

The CDCA Plan and the NECO Plan state that vehicle access is among the most important recreation issues in the desert. A primary consideration of the recreation program is to ensure that access routes necessary for recreation enjoyment are provided (BLM 2002).



Recreation and motorized travel opportunities are determined, in part, by the CDCA Plan multiple-use class and by OHV area designations. The multiple-use class is based on the sensitivity of resources and kinds of uses for each geographic area. Each of the four multiple-use classes describes a different type and level or degree of use that is permitted within that particular geographic area (refer to Section 3.2.10, *Land Use and Planning*, for a detailed discussion regarding CDCA Plan multiple-use classes). The proposed Project and Alternatives would be located in BLM Designated Multiple-Use Class M, in which vehicle access in areas would be allowed on existing routes unless it is determined that use must be further limited.

During the CDCA and NECO planning process, a detailed inventory and designation of routes was developed. This route designation system, along with other land management actions such as setting aside ACECs and the congressional designation of wilderness areas, has resulted in a significant loss of OHV recreation opportunities in eastern Riverside County. Currently, there are no BLM-designated “open” OHV areas in Riverside County.

Under the CDCA Plan, travel routes are classified as Open, Limited, or Closed, with the following definitions:

1) Open Route: Access by motorized vehicles is allowed.
2) Limited Route: Access by motorized vehicles is limited to use by number of vehicles, type of vehicle, time or season, permitted or licensed, or speed limits.
3) Closed Route: Access by motorized vehicles is prohibited except for authorized use.

As required by the CDCA Plan, the NECO Plan Amendment created a detailed inventory of existing routes within the NECO planning area (see Figure 3.2.14-2). A route has high significance if it provides access to other routes, historical sites, or recreational areas.

THIS PAGE INTENTIONALLY LEFT BLANK

Regional Recreation Resources

The Riverside County Regional Park and Open-Space District also provides several recreational facilities in the Project vicinity. A regional trail is proposed by the County along an existing railroad line (Riverside County 2010). The Regional Park and Open-Space District also owns and operates Mayflower Park, the Blythe Marina, and McIntyre Park, each of which provides long- and short-stay RV and tent camping, showers, picnicking, fishing, and boat launching; and Miller Park and Goose Flats Wildlife Area, which provide boating and fishing opportunities (County of Riverside 2003; DesertUSA 2012). The aforementioned facilities are illustrated in Figure 3.2.14-3.

Other Recreational Areas and Opportunities

The City of Blythe provides year-round sporting activities. The Blythe Parks Department oversees eight parks (approximately 74 acres total), including five neighborhood parks, two community parks, and one regional park. The "Big Foot Skate-board Park" is located at Todd Park. The Blythe Municipal Golf Course is approximately three miles from the Project area. The Mesa Verde Park, located just south of the Nicholls Warm Springs/Mesa Verde residential area, is approximately 0.4 mile (2,200 feet) from the proposed solar facility. Other recreational opportunities in Blythe include soccer, football, track and volleyball leagues; indoor racquetball; basketball; aerobic activities; weight room; and summer swimming. Various nearby privately owned RV parks and campgrounds also provide recreational facilities, including a boat dock, launch ramp, fishing, swimming, horseshoe pits, wildlife observation, and other active and passive recreation opportunities (City of Blythe 2007). The aforementioned facilities are illustrated in Figure 3.2.14-3.

The Cibola National Wildlife Refuge, administered by the USFWS, can be reached from the California side of the Colorado River, just south of Blythe, or, from the Arizona side, south of Quartzsite. This refuge was established in 1964 as mitigation for dam construction on the Colorado River, and provides important habitat for migratory birds, wintering waterfowl, and resident species. Recreational opportunities include hunting, fishing, wildlife viewing, and a nature trail (USFWS 2012). The refuge is approximately 14 miles from the Project area.

Agricultural areas, including those on the Project area, may be used for recreational activities; however, these activities are not assumed to occur with high frequency.

Regulatory Framework

Federal

California Desert Conservation Area Plan

The CDCA Plan (BLM 1980) includes a Recreation Element to address use of, and access to, recreational destinations within the California Desert. The management goals of the CDCA Plan Recreation Element are as follows:

1) Provide for a wide range of quality recreation opportunities and experiences emphasizing dispersed undeveloped use.
2) Provide a minimum of recreation facilities. Those facilities should emphasize resource protection and visitor safety.
3) Manage recreation use to minimize user conflicts, provide a safe recreation environment, and protect desert resources.
4) Emphasize the use of public information and educational techniques to increase public awareness, enjoyment, and sensitivity to desert resources.
5) Adjust management approach to accommodate changing visitor use patterns and preferences.
6) Encourage the use and enjoyment of desert recreation opportunities by special populations, and provide facilities to meet the needs of those groups.

In order to accommodate the goals, access to the desert must be provided while protecting sensitive resources. The Recreation Element states the following with regard to access:

> "To engage in most desert recreational activities outside of open areas, visitors must use motorized vehicles and usually travel on some previously used or marked motorized-vehicle route. Understandably, vehicle access is among the most important recreation issues in the Desert. A primary consideration of the recreation program, therefore, is to ensure that access routes necessary for recreation enjoyment are provided" (BLM 1980, p. 84).

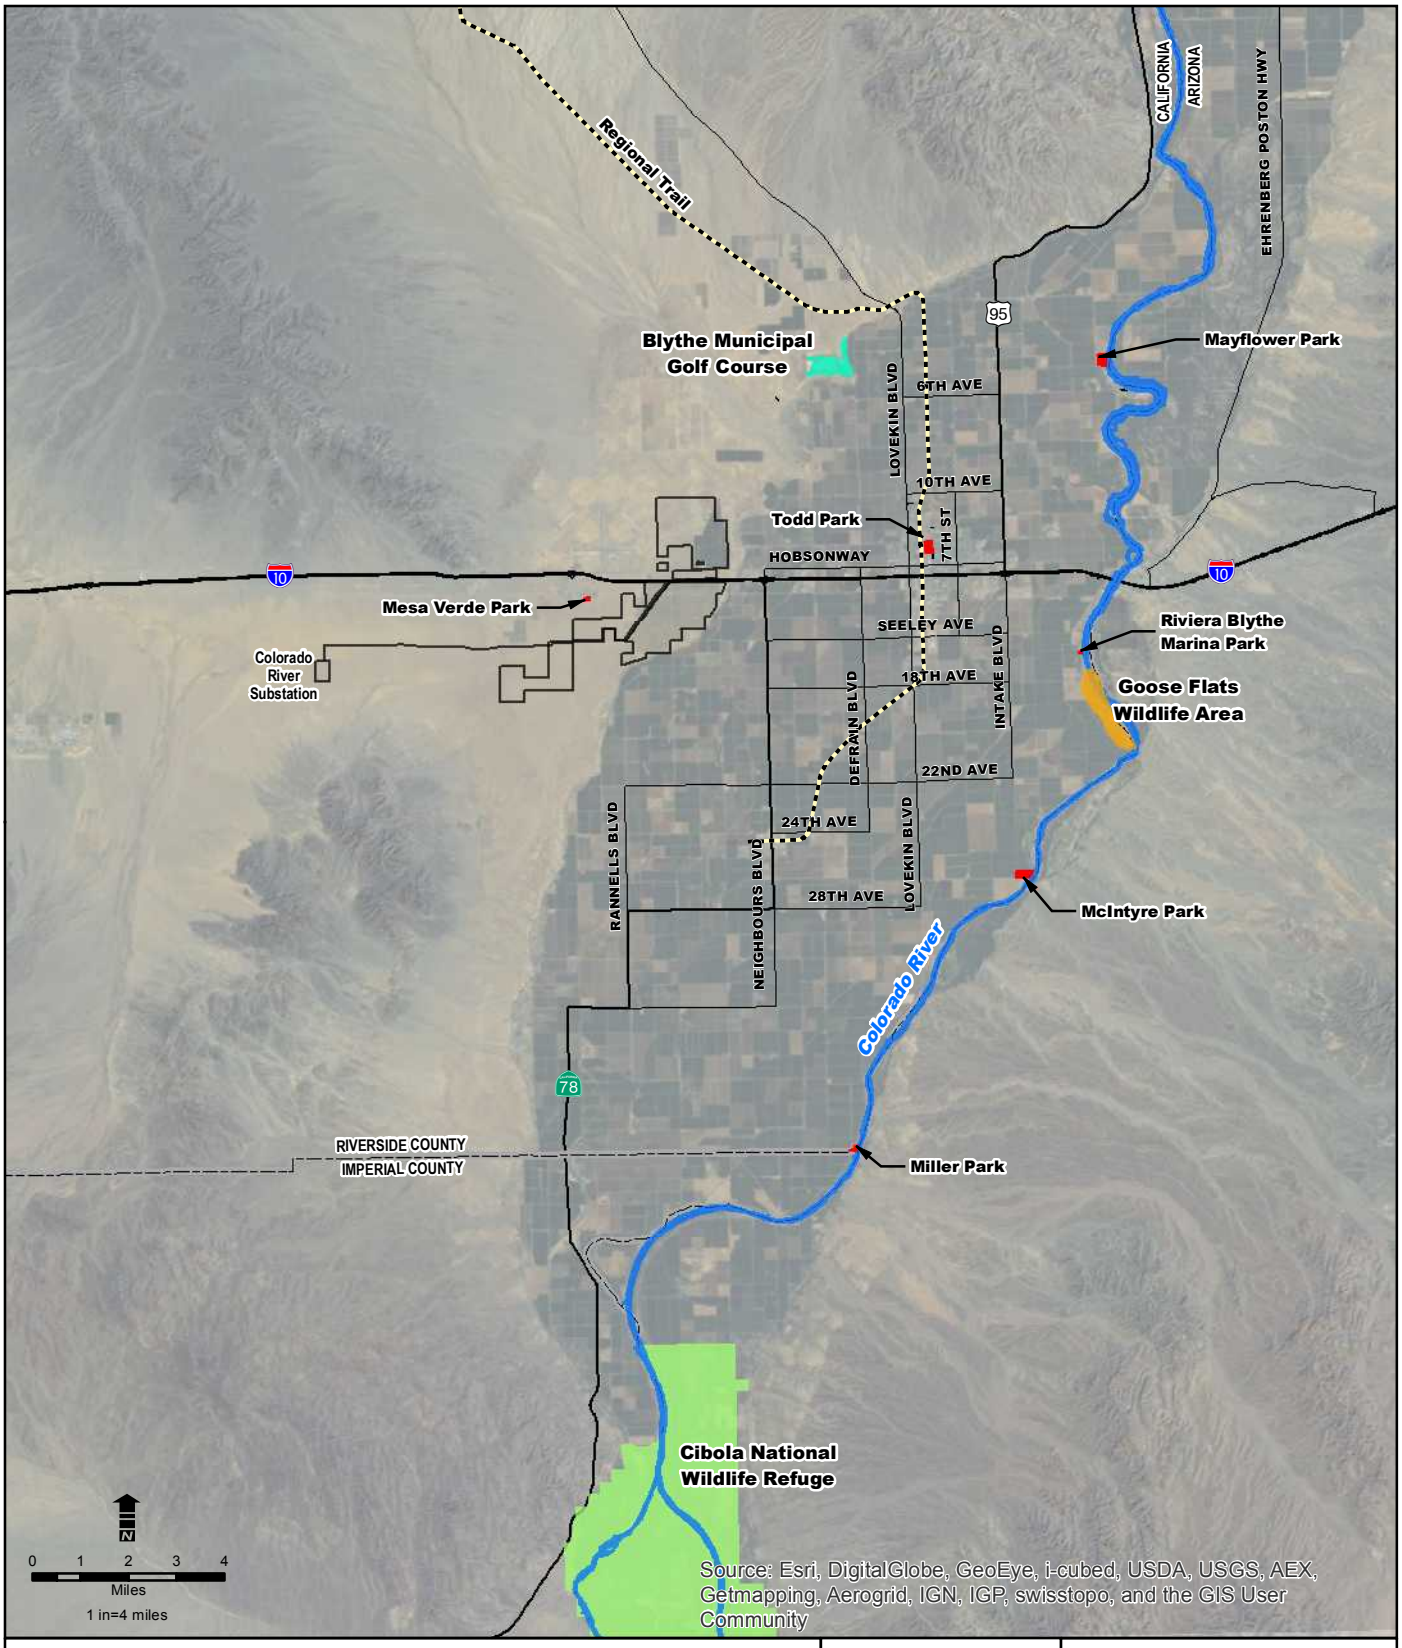
Northern and Eastern Colorado Desert Coordinated Management Plan

The NECO Plan (BLM and CDFG 2002), as amended to the CDCA Plan, provides for management of recreation within the California Desert area of El Centro, Blythe, Needles, and cities in the Coachella Valley, including the Project study area (BLM 2011). The NECO Plan specifies the type of recreational activities allowed in Multiple-Use Classes on BLM-administered land. Under this plan, new routes may be allowed if approved by the authorized officer.

Local

Riverside County General Plan

The solar facility is designated as Agriculture (AG) and Rural Community-Estate Density Residential (EDR-RC) according to the Riverside County General Plan Land Use Map. Both designations allow agriculture or limited agriculture. Agricultural areas may be used for recreational activities, such as hunting or walking. No specific policies relating to recreation apply to the proposed Project.



Palo Verde Valley Area Plan

Palo Verde Valley Area Plan (2008) policies that address recreational vehicle development include:

Policy PVVAP 5.4. *Allow remote recreational vehicle developments within the following land use designations: Very Low Density Residential, Estate Density Residential, Rural Residential, Rural Mountainous, Rural Desert, Open Space-Recreation, and Open Space-Rural*.

Trails and Bikeway System

Policy PVVAP 9.1. *Develop a system of multi-purpose trails that enhances the Colorado River's recreational values and connects with the adopted trails system of Riverside County*.

THIS PAGE INTENTIONALLY LEFT BLANK

3.2.15 Traffic and Transportation

This section describes the environmental setting and regulatory framework in regards to traffic and transportation for the proposed Project and Alternatives. The information in this section is based on the *Traffic Impact Study Report*, prepared by KOA Corporation 2013 (Appendix J of this Draft EIR/EA).

Environmental Setting

The Project area would be located in Riverside County approximately five miles west of the center of the City of Blythe and 40 miles east of Desert Center (refer to Figure 1-2 in Chapter 1). The Project would be located north and south of I-10, and west of State Route 89 and Highway 95. It is anticipated that most workers would be drawn from the Blythe/Palo Verde Valley region and the Desert Center region, with a smaller portion drawn from the Imperial Valley or Eastern Riverside County region. Workers and delivery trucks would access the site using the Neighbors Boulevard off-ramp from I-10; therefore, it is anticipated that the following four intersections within the traffic study area are likely to experience a substantial increase in traffic volume during construction and were selected for capacity evaluation:

- Intersection 1- Neighbours Boulevard and Riverside Drive
- Intersection 2 - Neighbours Boulevard and I-10 Westbound Ramps
- Intersection 3 - Neighbours Boulevard and I-10 Eastbound Ramps
- Intersection 4 -Neighbours Boulevard and Seeley Avenue

Regional Roadway Facilities

Interstate 10 **(I-10)** is the nearest freeway to the solar facility site and gen-tie lines. It provides regional east/west travel throughout the state, beginning in Los Angeles and continuing west past the California state border to Arizona and beyond. In the vicinity of the Project area, it has two lanes per direction. Neighbours Boulevard provides a full interchange with this freeway.

Existing Circulation Network

The local roadway facilities in the vicinity of the Project area include Neighbours Boulevard, Riverside Drive, and Seeley Avenue.

Neighbours Boulevard (State Route 78) is a two-lane roadway running on a north/south alignment connecting to I-10 via an existing interchange. It provides one travel lane per direction and is divided by a double-yellow center line. Land uses along this roadway in the Project vicinity include rural residential, with vacant lots and some commercial, farming land, and industrial land uses. Neighbours Boulevard (State Route 78) has been identified as a key critical segment by the Riverside County's Congestion Management Program.

Riverside Drive is a two-lane roadway running on an east/west alignment connecting to Neighbours Boulevard. It provides one travel lane per direction, with no centerline delineation. Land uses along this roadway in the Project vicinity include rural residential, with vacant lots and some farming land and industrial land uses.

Seeley Avenue is a two-lane roadway running on an east/west alignment connecting to Neighbours Boulevard. It provides one travel lane per direction, with no centerline delineation. Land uses along this roadway in the Project vicinity include rural residential, with vacant lots and some farming land and industrial land uses.

Existing Traffic Conditions

Existing Roadway Levels of Service

The *Highway Capacity Manual* (National Research Council 2000) provides methodologies utilized by the Project to assess potential impacts to traffic flow. A Level of Service (LOS) scale is used to indicate the quality of traffic flow on roadway segments and at intersections. LOS is an indicator of operating conditions on a roadway or at an intersection and is defined in categories ranging from A to F. LOS A represents the best traffic flow conditions with very low delay, and LOS F represents poor conditions. LOS A indicates free-flowing traffic, and LOS F indicates substantial congestion with long delays at intersections.

LOS for signalized intersections is based upon the average time (seconds) that vehicles approaching an intersection are delayed. There is a specific delay and level of service associated with each approach and an overall average delay for all movements. The overall LOS for the intersection is based upon the overall average delay.

Unsignalized intersection LOS is also based upon the control delay, but delay is only assessed for those traffic movements that are stopped or must yield to through traffic. Some movements, including cross traffic on the minor street or left turns onto the major street, can be subject to long delays; however, through traffic and right turns from the major street would not experience any delays at stopped intersections. When delay for cross traffic is severe (LOS F), the intersection should be evaluated further for possible improvement with traffic signals. In some cases, this analysis determines that the delay is being experienced by a very low number of vehicles, and traffic signals are not warranted. In other cases, when the number of stopped vehicles is substantial, and the delay is caused or substantially exacerbated by the Project, traffic signals may be justified as a mitigation measure, additional analysis is required to determine the need and justification for the installation of a traffic signal.

Table 3.2.14-1 shows the relationship between LOS and the performance measures for signalized and unsignalized intersections and lists the *Highway Capacity Manual* delay criteria for signalized intersections.

TABLE 3.2.14-1 INTERSECTION LEVELS OF SERVICE DEFINITIONS

LEVEL OF SERVICE	SIGNALIZED INTERSECTION CONTROL DELAY (IN SEC/VEH)	UNSIGNALIZED INTERSECTION CONTROL DELAY (IN SEC/VEH)
A	0 – 10	0 – 10
B	10.1 – 20	10.1 – 15
C	20.1 – 35	15.1 – 25
D	35.1 – 55	25.1 – 35
E	55.1 – 80	35.1 – 50
F	80.1 or more	50.1 or more

Source: National Research Council 2000, Exhibits 16.2 and 17-2.

Intersection turning movement classification counts were performed during the weekday morning peak period from 7:00 a.m. to 9:00 a.m. and during the weekday evening peak period from 4:00 p.m. to 6:00 p.m. in September 2011. Intersection classification counts provide vehicle classification (cars, pickups, buses, trucks, etc.) data in addition to the individual vehicle movements. Due to the nature of this Project, passenger car equivalent (PCE) factors were used in order to accurately evaluate the impact that a mode of transport has on traffic variables (such as headway, speed, density) compared to a single car. The traffic impacts of heavy trucks at intersections are normally addressed by converting heavy vehicles into PCEs. Studies have indicated that each truck has a similar traffic impact that ranges between 1.5 and 3.0 passenger vehicles at intersections. A PCE factor of 3.0 for 4-axle trucks, 2.0 for 3-axle trucks, and 1.5 for 2-axle trucks was applied to classification counts.

Traffic volumes may fluctuate from minute to minute within the peak periods, so a peak hour factor was added to the hourly volume, which would simulate a higher 15-minute peak period for the entire peak period. The existing peak hour factor (ranging from 0.0 to 1.0) was obtained from existing traffic count information and applied to all intersections for the existing and year 2015 conditions.

Freeway

I-10 currently operates at an LOS C east and west of Neighbours Blvd, also referred to as State Route 78 (BrightSource 2011).

Intersections

As illustrated in Table 3.2.14-2, all intersections within the study area of the proposed Project are operating at an acceptable level of service (LOS A). For both a.m. and p.m. peak hours, most of the traffic originates from the south towards the ramps and Hobson Way, with a very limited amount of traffic heading towards Riverside Avenue. Most of this traffic can be attributed to the heavy agriculture activities located south of I-10 heading to and from the City of Blythe. The higher volumes heading northbound and southbound from Seeley Avenue cause a higher delay at the intersection; however, all of the intersections operate at LOS A, which represents a free-flow operation, and vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.

TABLE 3.2.14-2 EXISTING INTERSECTION CONDITIONS

INTERSECTION	WITHOUT PROJECT	
	Delay (sec/veh)	LOS
AM Peak Hour		
1. Riverside Dr & Neighbours Blvd*	9.0	A
2. I-10 WB Ramp & Neighbours Blvd*	9.0	A
3. I-10 EB Ramp & Neighbours Blvd*	9.2	A
4. Seeley Ave & Neighbours Blvd*	9.4	A
PM Peak Hour		
1. Riverside Dr & Neighbours Blvd*	8.6	A
2. I-10 WB Ramp & Neighbours Blvd*	9.5	A
3. I-10 EB Ramp & Neighbours Blvd*	9.5	A
4. Seeley Ave & Neighbours Blvd*	9.8	A

Note: *Unsignalized Intersection

Pedestrian

Pedestrian facilities currently do not exist in the proposed Project study area. There are no sidewalks, crosswalks, or related pedestrian facilities along Neighbours Boulevard, Riverside Drive, and Seeley Avenue.

Bus Service

Bus service is offered by the Palo Verde Valley Transit Agency along Neighbours Boulevard north and south of I-10. Bus routes 3, 4, and 5 travel along Hobson Way, which passes through the Project location and heads west towards Mesa Verde. There is a stop located adjacent to the Project at the intersection of Hobson Way and Buck Boulevard. Bus routes 3 and 5 run along Neighbours Boulevard towards Ripley, with stops on the corner of Hobson Way and 14th Avenue along Neighbours Boulevard.

Rail Service

Blythe is served by the Arizona and California Railroads, but there is no service directly to and from Blythe via rail.

Airport Service

Blythe Airport is a public airport located six miles west of Blythe and adjacent to the Project, serving Riverside County. The airport has two runways and is mostly used for general aviation. WR Byron Airport is a private airport located within city limits, approximately four miles northwest of central Blythe and 4.5 miles northeast of the Project. Cyr Airport is a private airport with two runways that is located two miles south from the center of Blythe and five miles east of the solar facility.

Bicycle

No bicycle facilities (e.g., bicycle paths, lanes, or routes) currently exist in the proposed Project study area.

School

The Palo Verde Unified School District comprises the Blythe area public elementary and secondary schools, including three elementary schools, one middle school, one high school, and one continuation/adult education school. Palo Verde Community College District is part of the California Community College system and includes Palo Verde Community College, a campus in Blythe, a center in Needles, and an extension for Adult Basic education and non-credit classes located on Spring Street in downtown Blythe. Table 3.2.14-3 indicates the schools and distance from the solar facility.

TABLE 3.2.14-3 SCHOOL BUS CHARACTERISTICS IN THE PROJECT VICINITY

SCHOOL NAME	DISTANCE FROM SOLAR FACILITY
Palo Verde College	2.50 miles north
Palo Verde Unified School District	
Palo Verde High School	3.75 miles east
Blythe Middle School	3.75 miles east
Twin Palms Continuation School	3.75 miles east
Margaret White Elementary School	4.25 miles east
Felix J. Appleby Elementary School	4.50 miles east
Ruth Brown Elementary School	4.75 miles east

Regulatory Framework

Federal

The CFR provides guidelines for regulations as they relate to the movement of hazardous materials via the Federal Motor Carrier Safety Administration. FAA guidelines, regulations are provided for aviation activities during the construction and post-construction periods. The following federal laws and regulations would be applicable to the proposed Project.

Objects Affecting the Navigable Air Space: Title 14 CFR Part 77

This regulation describes the criteria used to determine the need for an FAA "Notice of Proposed Construction or Alteration" in cases of potential obstruction hazards and requires applicants to submit the form for construction near an airport.

CFR Title 14 Aeronautics and Space, Part 77 Objects Affecting Navigable Airspace

This regulation establishes standards for determining physical obstructions to navigable airspace; sets noticing and hearing requirements; and provides for aeronautical studies to determine the effect of physical obstructions to the safe and efficient use of airspace.

Proposed Construction and/or Alteration of Objects that May Affect the Navigable Air Space: FAA Advisory Circular No. 70/7460-2K

This regulation describes FAA Standards for marking and lighting of obstructions identified by Title 14 CFR Part 77.

CFR Title 47 Section 15.2524

This regulation prohibits operation of devices that can interfere with radio-frequency communication.

CFR, Title 49, Subtitle B

This regulation includes procedures and regulations pertaining to interstate and intrastate transport (including hazardous materials program procedures) and provides safety measures for motor carriers and motor vehicles that operate on public highways.

State

The California Vehicle Code (CVC) and the California Streets and Highway Code outline regulations as pertains to the transportation of hazardous waste within the state; the following laws and regulations would be potentially applicable to the proposed Project.

CVC Section 353

This regulation defines hazardous materials.

CVC Sections 2500-2505

This regulation authorizes the issuance of licenses for the transport of hazardous materials.

CVC, Div 2, Chapter 2.5; Div 6; Chap. 7; Div 13; Chap. 5; Div. 14.1; Chap 1 & 2; Div. 14.8; Div. 15

These regulations pertain to licensing, size, weight, and load of vehicles operated on highways; safe operation of vehicles; and the transportation of hazardous materials.

California Streets and Highway Code, Div 1, Chap 3; Div 2 Chap 5.5

These regulations cover the care and protection of state and county highways and provisions for the issuance of written permits.

CVC Sections 13369, 15275 and 15278

These regulations address the licensing of drivers and the classification of licenses required for the operation of particular types of vehicles; they also require certificates permitting operation of vehicles transporting hazardous materials.

CVC Sections 31303-31309

These regulations regulate the highway transport of hazardous materials, the routes used, and restrictions on those facilities.

CVC Sections 35780

These regulations require permits for any load exceeding California Department of Transportation weight, length, or width standards for public roadways.

CVC Sections 31600-31620

These regulations regulate the transportation of explosive materials.

CVC Section 32100-32109

These regulations establish special requirements for the transportation of inhalation hazards and poisonous gases.

CVC Sections 32000-32053

These regulations regulate the licensing of carriers of hazardous materials, including noticing requirements.

CVC Sections 34000-34121

These regulations establish special requirements for the transportation of flammable and combustible liquids over public roads and highways.

CVC Section 34500 et seq.

These regulations regulate the safe operation of vehicles, including those that are used for the transportation of hazardous materials.

California Health and Safety Code Section 25160 et seq.

These regulations require that an authorized representative of the generator or facility operator that is responsible for loading hazardous waste into a transport vehicle shall, prior to loading, ensure that the driver of the transport vehicle is in possession of the appropriate class of driver's license and any endorsements required to operate the transport vehicle with the intended load.

California Streets and Highways Code Sections 117, 660-695, and 700-711

These regulations govern ROW encroachment and the granting of permits for encroachments on State Highways and freeways.

California Streets and Highways Code Sections 1450, 1460 et seq., and 1480 et seq.

These regulations govern ROW encroachment and the granting of permits for encroachments on county roads.

California Government Code Sections 65352, 65940, and 65944

These regulations require evaluation of compatibility with military activities for any land use proposal located near a military installation or airspace.

Local

2011 Riverside County Congestion Management Program

County of Riverside Congestion Management Plan

Riverside County's Congestion Management Plan specifies that all Congestion Management Plan roadways operate at a Level of Service (LOS) of "E" or better. All state highways and principal arterials are Congestion Management Plan roadways. I-10 and SR-177 are the only Congestion Management Plan roadways in the Project study area. The Congestion Management Plan was first established in 1990 under Proposition 111.

Proposition 111 established a process for each metropolitan county in California to designate a Congestion Management Agency that would be responsible for development and implementation of the Congestion Management Plan within county boundaries. The Riverside County Transportation Commission was designated as the Congestion Management Agency in 1990 and, therefore, prepares the Congestion Management Plan updates in consultation with the Technical Advisory Committee, which consists of local agencies, the County of Riverside, transit agencies, and subregional agencies.

The Riverside County Transportation Commission's adopted minimum LOS threshold is LOS "E." Therefore, when a Congestion Management Plan street or highway segment falls to "F," a deficiency plan must be required. Preparation of a deficiency plan will be the responsibility of the local agency where the deficiency is located. Other agencies identified as contributors to the deficiency will also be required to coordinate with the development of the plan. The plan must contain mitigation measures, including consideration of Transportation Demand Management strategies and transit alternatives, and a schedule for mitigating the deficiency.

Regional Comprehensive Plan and Regional Transportation Plan

The Southern California Association of Government's (SCAG's) Intergovernmental Review section, part of the Environmental Planning Division of Planning and Policy, is responsible for performing consistency review of regionally significant local plans, projects, and programs. Regionally significant projects are required to be consistent with SCAG's adopted regional plans and policies, such as the Regional Comprehensive Plan and the Regional Transportation Plan. The criteria for projects of regional significance are outlined in CEQA Guidelines Sections 15125 and 15206. According to the SCAG Intergovernmental Review Procedures Handbook, "new or expanded electrical generating facilities and transmission lines" qualify as regionally significant projects.

Policy 3.05: *Encourage patterns of urban development and land use which reduce costs on infrastructure construction and make better use of existing facilities.*

Policy 3.14: *Support local plans to increase density of future development located at strategic points along the regional commuter rail, transit systems, and activity centers.*

Policy 3.16: *Encourage developments in and around activity centers, transportation corridors, underutilized infrastructure systems, and areas needing recycling and redevelopment.*

Policy 3.17: *Support and encourage settlement patterns which contain a range of urban densities.*

Policy 3.18: *Encourage planned development in locations least likely to cause adverse environmental impact.*

Policy RTP G5: *Protect the environment, improve air quality and promote energy efficiency.*

Policy RTP G6: *Encourage land use and growth patterns that complement our transportation investments and improve the cost-effectiveness of expenditures.*

Policy GV P1.1: *Encourage transportation investments and land use decisions that are mutually supportive.*

Policy GV P4.2: *Focus development in urban centers and existing cities.*

Policy GV P4.3: *Develop strategies to accommodate growth that uses resources efficiently, eliminate pollution and significantly reduce waste.*

Policy GV P4.4: *Utilize "green" development techniques.*

Riverside County General Plan

The Riverside County General Plan (adopted October 2003) is applicable to all unincorporated lands within Riverside County. Countywide policies that address traffic and transportation within the County boundaries are located in the Circulation Element and Land Use Element of the County General Plan, and include:

Circulation Element (C)

Policy C 2.1. *Maintain the following countywide target Levels of Service: LOS "C" along all County maintained roads and conventional state highways. As an exception, LOS "D" may be allowed in Community Development areas, only at intersections of any combination of Secondary Highways, Major Highways, Arterials, Urban Arterials, Expressways, conventional state highways or freeway ramp intersections.*

LOS "E" may be allowed in designated community centers to the extent that it would support transit-oriented development and walkable communities.

Policy C2.2. *Apply level of service standards to new development via a program establishing traffic study guidelines to evaluate traffic impacts and identify appropriate mitigation measures for new development.*

Policy C 2.3. *Traffic studies prepared for development entitlements (tracts, plot plans, public use permits, conditional use permits, etc.). Shall identify project related traffic impacts and determine the "significance" of such impacts in compliance with CEQA.*

Policy C 2.4. *The direct project related traffic impacts of new development proposals shall be mitigated via conditions of approval requiring the construction of any improvements identified as necessary to meet level of service standards.*

Policy C 3.10. *Require private and public land developments to provide all on-site auxiliary facility improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development project shall be undertaken to identify project impacts to the circulation system and its auxiliary facilities. The Transportation Department may require developers and/or subdividers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.*

Policy C 6.2. *Require all-weather access to all new development.*

Policy C 7.1. *Work with incorporated cities to mitigate the cumulative impacts of incorporated and unincorporated development on the countywide transportation system.*

Policy C7.9. *Review development applications in cooperation with RCTC and as appropriate, to identify the precise location of CETAP corridors and act to preserve such areas from any permanent encroachments, pending dedication or acquisition.*

Policy C 20.4. *Control dust and mitigate other environmental impacts during all stages of roadway construction.*

Policy C 20.13. *Implement National Pollutant Discharge Elimination System Best Management Practices relating to construction of roadways to control runoff contamination from affecting the groundwater supply.*

Land Use Element (LU)

Policy LU 6.2(a). *The facility is compatible in scale and design with surrounding land uses, and does not generate excessive noise, traffic, light, fumes, or odors that might have a negative impact on adjacent neighborhoods.*

Policy LU 6.4. *Retain and enhance the integrity of existing residential, employment, agricultural, and open space areas by protecting them from encroachment of land uses that would result in impacts from noise, noxious fumes, glare, shadowing, and traffic.*

Riverside County General Plan- Palo Verde Valley Area Plan

The applicable policy related to traffic and transportation included with the PVVAP is provided below.

Policy PVVAP 7.2. *Maintain the County's roadway Level of Service standards as described in the Level of Service section of the General Plan Circulation Element.*

Riverside County Municipal Code Title 10, Chapter 10.08, Sections 10.08.010 – 10.08.180

These regulations establish requirements and permits for oversize and overweight vehicles.

Riverside County Ordinance No. 460

This ordinance specifies that all work shall conform to the requirements of the Riverside County Transportation Department Subdivision Regulations.

Riverside County Ordinance No. 461

This ordinance specifies that all work shall conform to the requirements of the Riverside County Transportation Department Road Improvement Standards and Specifications.

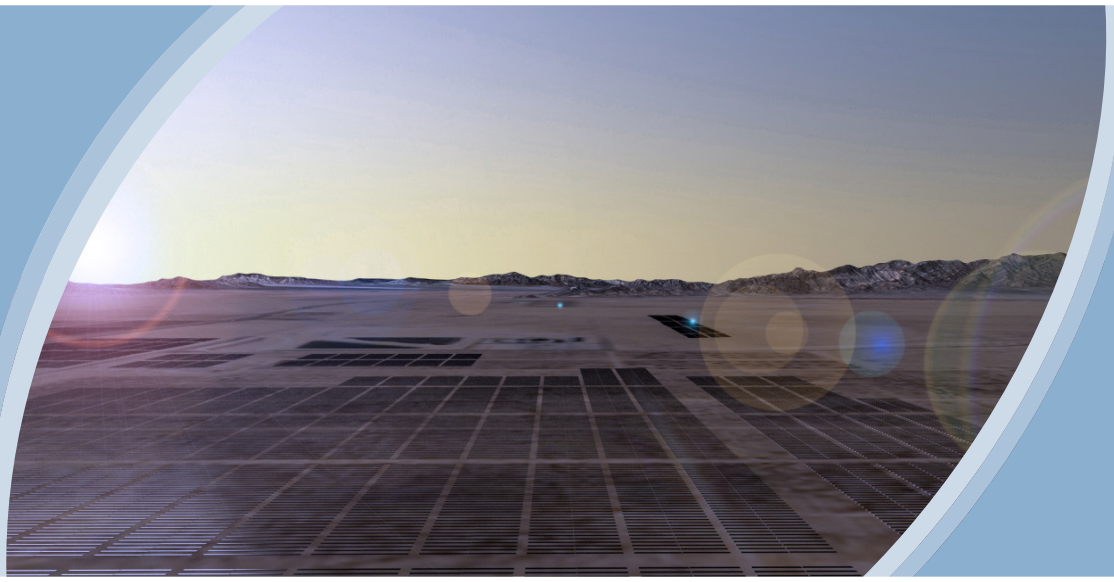
City of Blythe General Plan

City policies in the City of Blythe General Plan 2025 (2007) related to traffic and transportation are located in the Circulation Element Guiding Policies of the City General Plan, and include:

Circulation Element

Policy 11*: Strive to maintain traffic LOS B on residential streets and LOS C or better on arterial and collector streets, at all intersections, and on principal arterials in the Congestion Management Plan during peak hours.*

Policy 12: *Accept LOS D for built-out areas served by transit after finding that:*



- There is no practical and feasible way to mitigate the lower level of service; and
- The uses resulting in the lower level of service are of clear, overall public benefit.

City of Blythe Municipal Code, Title 10, Article 19, Section 19.1

This code establishes permit requirements for moving heavy loads or equipment on city streets.

AR060803

1.0 PROJECT BACKGROUND

Renewable Resources Group (RRG or Applicant) is proposing the Blythe Mesa I Solar Project (Proposed Project) that would involve the construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure to provide site access and connection to the statewide electricity transmission grid. The Project would produce enough energy to power approximately 180,000 households and progress the goals of the California Renewable Portfolio Standard (RPS) and other similar renewable programs in the state.

In compliance with the California Environmental Quality Act (CEQA), the County of Riverside is the Lead Agency responsible for preparation of an Environmental Impact Report (EIR). POWER Engineers, Inc. has been hired by the Applicant to assist with the environmental studies and preparation of the EIR.

This Scoping Report for the Proposed Project documents the public outreach efforts by the County of Riverside and Applicant, and summarizes the issues and concerns expressed by agencies, organizations, members of the public, and Native American tribes during the public scoping period.

Scoping is an early and open process for determining the scope of issues to be addressed, and identifying the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in the EIR.

2.0 NOTICE OF PREPARATION OF EIR

In compliance with Title 14 of the California Code of Regulations (CCR) Section 15082, Riverside County prepared a Notice of Preparation (NOP) of an EIR that described the proposed project and location, environmental review process, the potential environmental effects, and contact information; as well as announced the time and location of the public scoping meeting. On November 16, 2011, the NOP was filed with the State Clearinghouse (SCH) [SCH No. 2011111056]. The NOP was also filed with the County of Riverside's County Clerk on November 21, 2011 and commenced the public review period. Agencies, elected officials, and Native American Tribes listed in Table 1 were sent a copy of the NOP via certified mail. A copy of the NOP and mailing labels may be found in Appendix A.

3.0 PUBLIC SCOPING MEETINGS

In compliance with CCR Section 15082(c), Riverside County conducted a public scoping meeting to inform the public about the project; describe the purpose and need of the project; provide information regarding the environmental review process; and gather public input regarding the scope and content of the EIR. The public scoping meeting was held on the following date and location:

December 12, 2011; 5:30 to 7 pm
Blythe City Council Chambers
235 N. Broadway
Blythe, CA 92225

The scoping meeting was announced in the NOP. The meeting was also advertised in the Desert Sun and Palo Verde Times on December 2, 2011. A copy of the newspaper advertisement may be found in Appendix B.

The copies of the PowerPoint presentation, display boards, comment form, and meeting transcript are located in Appendix C.

Project team members were available to answer questions about the displays and other project-related topics. The team members listed in Table 2 also listened to feedback, concerns and issues raised by the public.

TABLE 2. PROJECT TEAM MEMBERS ATTENDING THE PUBLIC SCOPING MEETING

Personnel	Role	Affiliation
Ken Baez	Principal Planner	Riverside County Planning Department
Jay Olivas	Planner	Riverside County Planning Department
Barbara Burrow	Planner	City of Blythe
Rupal Patel	Project Manager	Renewable Resources Group, Inc.
Jim James	Regulatory Affairs Manager	Renewable Resources Group, Inc.
Thomas Ryan	Project Manager	POWER Engineers, Inc.
Karen Cadavona	Project Coordinator	POWER Engineers, Inc.

A total of 6 people signed in at the scoping meeting (December 12, 2011). Attendees were encouraged to comment by filling out a comment form.

4.0 OUTREACH

4.1 NOTIFICATION TO SCOPING SESSION

A Notice of a Scoping Session was mailed to 120 property owners within 2,400 feet of the Project boundary (Appendix D). The notice briefly discussed the Proposed Project and date, time, and location of the scoping meeting.

4.2 NATIVE AMERICAN CONSULTATION

Tribal consultation under CEQA, Public Resources Code Section 21000 -21177, is “advisory” rather than mandated. However, the 2006 Senate Bill 1059 (Transmission Corridor Designation and Implementation) mandates tribal consultation for “electric transmission corridors.” This is codified in the California Public Resources Code, Chapter 4.3, and Section 25330 to Division 15, which require consultation with

California Native American tribes, and identifies both federally recognized and non-federally recognized tribes on a list maintained by the Native American Heritage Commission (NAHC).

In April 2011, a letter was submitted to the NAHC requesting information regarding Native American groups that may have historic ties to, and interest in, the proposed Blythe Mesa I Solar Project area. In May 2011, 20 CEQA scoping letters were sent to the tribes identified by the NAHC. A representative letter to the tribes may be found in Appendix E. Responses were received from the Aqua Caliente Band of Cahuilla Indians Tribal Historic Preservation Officer and Augustine Band of Cahuilla Indians

Tribal consultation required under Section 106 for the portion of the Project on public land will be performed by the U.S. Department of the Interior, Bureau of Land Management (BLM) on a government-to-government basis.

5.0 SCOPING COMMENTS SUMMARY

This section summarizes the comments received from the public and agencies during the scoping period for the Proposed Project from November 21, 2011 to December 21, 2011. A total of ten comments were received during the scoping period. All ten comments were received from agencies (one of the ten comments was a courtesy notice from the State Clearinghouse to comment in a timely manner).

Appendix F includes copies of the original comments as received during the NOP scoping period.

Below is a summary of the issues and comments that were raised by the commenters. The comments are organized by issue topic.

5.1 HUMAN ENVIRONMENT ISSUES

5.1.1 Air Quality

The Mojave Desert Air Quality Management District (MDAQMD) had no comment regarding the analysis of potential air quality impacts from the Proposed Project that would be included in the Draft EIR. The MDAQMD made mention of where to locate attainment plans.

5.1.2 Public Services and Utilities

The Riverside County Waste Management Department (RCWMD) was concerned that the quantity of waste generated during construction and demolition could have the potential to exceed a given landfill's daily permitted capacity. The RCWMD requested that the Draft EIR analyze the potential solid waste impact and specified that Project-generated waste would be disposed of at the Blythe Landfill (permitted to receive a maximum of 400 tons per day of refuse). In addition, the RCWMD requested the following measure for waste recycling: a Waste Recycling Plan (WRP), identifying the materials generated, their amounts, and recycling measures and reduction rates, to be submitted to the RCWMD for approval. The RCWMD also commented in acknowledgement of the Blythe Airport Dumpsite for use within the vicinity of the Proposed Project. Xeriscaping was also recommended, as well as the use of drought tolerant/low maintenance vegetation for landscaped Project areas.

Southern California Edison (SCE) commented that if the interconnection facilities to be constructed/relocated are over 200 kV, SCE is required to obtain a Certificate of Public Convenience and Necessity (CPCN) from the California Public Utilities Commission (CPUC). Early coordination with SCE is recommended to obtain certain permits for SCE facilities and scope of work necessary to

interconnect the Proposed Project. SCE also requested that the foreseeable SCE scope of work and associated impacts be submitted to the Lead Agency early in the environmental review process.

The Sheriff's Department, Colorado River Station commented on the location of the Project in relation to the Sheriff's Department Shooting Range in Parcel #824-080-004. 24-hour access is required and live fire activities could occur between 5:00 a.m. and 11:00 p.m. any day of the week.

5.1.3 Socioeconomics

The Southern California Association of Governments (SCAG) commented that the Draft EIR should reflect the most current SCAG forecasts, which is the 2008 Regional Transportation Plan (RTP), May 2008, Population, Household and Employment forecasts. SCAG also recommended referencing the 2008 RTP as well as SCAG's Regional Growth Principals. SCAG's List of Mitigation Measures should be reviewed and followed where applicable to the Project.

5.2 NATURAL ENVIRONMENT ISSUES

5.2.1 Hazardous Materials/Soils

The Department of Toxic Substances Control (DTSC) requests that the Draft EIR evaluate whether conditions within the Project area would pose a threat to human health or the environment using regulatory agency databases. DTSC also recommended that the Draft EIR identify the mechanism to initiate a required investigation and/or remediation for a site within the Proposed Project area that may be contaminated. Subsequently, any environmental investigation, sampling and/or remediation should be conducted under a regulatory agency approved work plan; any findings must be summarized in the document.

DTSC requested investigations for the presence of hazardous chemicals, mercury, and asbestos in buildings, structures, or paved surface areas to be demolished. If any soil excavation or filling is required, soil sampling may be necessary; if contaminated, it must be properly disposed of. Human health and sensitive receptors should be protected, and a health risk assessment may be necessary to determine if there are, have been, or will be, any hazardous materials releases. DTSC also recommended proper investigation and remedial actions, as on-site soils or groundwater could contain pesticides, agricultural chemical or organic waste. Any hazardous wastes generated must be managed under California Hazardous Waste Control Law. DTSC can provide cleanup oversight through an Environmental Oversight Agreement or Voluntary Cleanup Agreement if needed.

RCWMD commented regarding potential hazardous waste generated from Project activities. As hazardous materials are not accepted at Riverside County landfills, any hazardous waste generated must be disposed of at a permitted hazardous waste facility.

5.2.2 Cultural Resources

The Agua Caliente Band of Cahuilla Indians (ACBCI) commented that the Project is not located on lands managed by the ACBCI, but the Project is within the ACBCI's Traditional Trade Network Area. The ACBCI Tribal Historic Preservation Office (THPO) recommended a 100% cultural resources inventory of the Project area by a qualified archaeologist prior to any development activities (all documentation generated should be forwarded to the THPO for review). THPO also recommended the presence of an approved Native American Cultural Resource Monitor(s) during any ground disturbing activities.

Comments regarding cultural resources were also submitted by the NAHC. The NAHC's Sacred Lands File (SLF) search identified no Native American cultural resources within the Project area. However, the

absence of archaeological resources does not preclude their existence; the area is known to the NAHC to be culturally sensitive. Early consultation with Native American Tribes in the area is recommended and required. Tribes must be provided with all pertinent Project information. The NAHC recommended avoidance and resource documentation, as defined by CEQA Guidelines 15370(a) and 2183.2 respectively, for a project that would damage and/or destroy Native American cultural resources. In addition, the historic context of the Proposed Project and the cultural landscape must be considered. Any potential cultural resources discovered in the Project area may not be disclosed to keep historic properties of religious and cultural significance confidential.

5.2.3 Water Resources

The Riverside County Flood Control and Water Conservation District (District) commented regarding the watercourse and drainage patterns of the Project area. The District recommended that the Draft EIR describe the drainage of the general area, the Project site, and the site's tributary drainage. In addition, the Draft EIR should include a description of how on-site storm runoff would be collected and adequately conveyed, a description of how the Project collects and protects against off-site storm runoff, the identification and description of an existing drainage facility in the area, and detail regarding the impacts and mitigation for water quality caused by development. Hydrology/hydraulic study, exhibits, and other pertinent information should also be included. As a natural watercourse bisects the low southern portion of the Project, the Draft EIR should also address how the Project would mitigate impacts to floodplain(s) or watercourses. Lastly, the District recommends that a grading and drainage plan should be included in the Draft EIR; the maintenance access and site grading should be designed to maintain the existing natural drainage patterns with respect to tributary drainage areas, outlet points, and outlet conditions.

6.0 NEXT STEPS IN THE EIR PROCESS

Comments received during the public scoping period will be considered during the preparation of the Draft EIR. The Draft EIR is anticipated for public review in Summer 2012 and agencies, organizations, and Native American Tribes will have an opportunities to provide additional input on the Draft EIR. The Final EIR is expected in late summer 2012. The Project is expected to be considered by the County of Riverside Board of Supervisors in late summer 2012.

RIVERSIDE COUNTY
PLANNING DEPARTMENT

Carolyn Syms Luna
Director

Agency Notice of Preparation of an Draft Environmental Impact Report

DATE: November 16, 2011

TO: _____
_____
_____

PROJECT CASE NO./TITLE: Environmental Impact Report No. 529 / Conditional Use Permit No. 3670 / Public Use Permit No. 913 / Blythe Mesa I Solar Project

PROJECT LOCATION: East Riverside County - Palo Verde Area Plan, the Blythe Mesa I Solar Project is located approximately 5 miles west of central Blythe and 40 miles east of Desert Center; more specifically, the project is located north and south of Interstate 10, west of Neighbors Boulevard and Arrowhead Boulevard, south and east of the Blythe Airport. The site consists primarily of agricultural land located south and east of the community of Nicholls Warm Springs/Mesa Verde. APNs 821-110-004, 821-120-025, 821-120-026, 821-120-027, etc. (see attached sheet entitled "Blythe Mesa Solar Project" "Assessor's Parcels for Solar Field (CUP03670)". Also, as shown on the exhibits entitled "Blythe Mesa Solar Project - Topographic Quadrangle Map", "Public Use Permit", "Blythe Mesa Solar Project Conditional Use Permit #3670 Pages 1 & 2", Exhibits "A1", "Notice of Preparation Attachment A", "Figure 1: Regional Area Map", "Figure 2: Site Plan & Solar Module", and "Figure 3: Typical Tiled Tracker Panels".

PROJECT DESCRIPTION: The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on a total of approximately 3,660 acres. The proposed project would consist of a solar array field utilizing single-axis solar PV trackers and panels with a combined maximum height of 8 feet. Supporting facilities on-site would include three electrical substations, two operation and maintenance buildings, inverters, transformers, and associated switchgear. Since most of the site has nearly level to gently sloping topography, no mass grading would be required and the natural drainage patterns of the site would not be significantly altered. The Project site would be secured 24 hours per day by onsite private security personnel or remote services with motion-detection cameras. An equestrian-wire, wildlife-friendly and drainage-compaitble security fence that meets National Electric Safety Code would be placed around the perimeter of the site. The proposed lighting for the site would be consistent with County building code. A new 8.4 mile long, 230 kilovolt (kV) double-circuit generation-tie transmission line would connect the proposed project with the approved Colorado River Substation located west of the project site subject to Public Use Permit (3.6 miles of the gen-tie line are located within the project site, and 4.8 miles are located off-site between the project site and the Colorado River Substation). A majority of the project is within the County of Riverside jurisdiction. An approximate 330-acre portion of the 3,660-acre project site is located within the City of Blythe jurisdiction. A Development Agreement between the County of Riverside and the applicant will be established setting forth the rights and responsibilities of each party with respect to project development and operation.

Los Angeles, CA 90036

Pursuant to Riverside County Rules to Implement the California Environmental Quality Act ("CEQA"), notice is given to responsible and interested agencies that the Riverside County Planning Department plans to oversee the preparation on an Environmental Impact Report for the above-described project. Given that the above-described project is subject to both CEQA and the National Environmental Policy Act ("NEPA"), a combined Environmental Impact Report – Environmental Impact Statement will be prepared. The purpose of this notice is to solicit guidance from your agency as to the scope and content of the environmental information to be included in the EIR. In accordance with the time limits mandated by State law, information in that regard should be submitted to this office as soon as possible, but **not later than thirty (30) days** after receiving this notice.

In addition to offering the opportunity to submit written comments, the County of Riverside will hold a scoping meeting to discuss the proposed project, environmental process, and provide agency representation, individuals, and other interested parties the opportunity to make oral comments regarding the scope of the EIR. The scoping meeting will be held at the time a place indicated below.

Blythe Mesa I Solar Project Scoping Meeting
Date: December 12, 2011
Time: 6:00 p.m.
Location: Blythe City Council Chambers
235 North Broadway
Blythe, CA 92225

Attached is a copy of the issues to be included in the draft EIR. If you have any questions please contact Jay Olivas, Project Planner at (951) 955-1195 or E-mail at jolivas@rctlma.org.

Sincerely,

RIVERSIDE COUNTY PLANNING DEPARTMENT
Carolyn Syms Luna, Director

Jay Olivas, Project Planner

BLYTHE MESA SOLAR PROJECT CONDITIONAL USE PERMIT #3670

Vicinity Map

Project Description:

Blythe Mesa Solar is a 485 megawatt (MW) photovoltaic solar power plant on approximately 84 parcels totaling 3,428.15 acres. A total of 330 power blocks will be constructed, each will be constructed containing an equipment pad and a 9'X18' parking area. The proposed panels will have a maximum height of 8'. The site will be secured with a 6 foot chain-linked fence topped with 2' of barbed wire and all construction staging and temporary facilities will be on site within the project area. These new project substations will consist of a 34.5 to 230kV transformer and will interconnect to the new Southern California Edison (SCE) Colorado River Substation 230 kV switchyard.

County Water Quality Management Plan:

Project is not located in the Santa Ana, Santa Margarita, San Jacinto and Whitewater River Watersheds. The project will not alter the existing natural drainage pattern of the site.

Utilities:

School District: Palo Verde Valley Unified School District
Water: Palo Verde Irrigation District and City of Blythe
Sewer: City of Blythe (Project will provide it's own private septic system)
Gas: Southern California Gas Company
Electricity: Southern California Edison
Telephone: Verizon
Cable Television: NPG Cable, Inc. (a.k.a. Blythe Cable)

Community Services District:

None

Dwelling Units/Lots and Recreational Vehicle Spaces:

None

Occupancy Classification:

U

Specific Plan:

None

Typical street improvement cross-sections:

None proposed.

Existing or Proposed Common, Open Space, Landscaped, Planting or Recreational Area:

None

Easement Notes:

Rivera #11. An easement shown or dedicated on the map of Parcel Map No. 14907 on file recorded January 29, 1981 in Book 87, Page 96, of Parcel Maps. For: Public roads and incidental purposes. The location of the easement cannot be determined from record information. (Not plottable).

Cocopah #27. An easement for pipeline for conveyance of water and incidental purposes, recorded December 5, 1955 as Instrument No 85-274269 of Official Records. (See sheet 2 for Location)

Cocopah #40/41/112. The effect of a Declaration of Dedication as show by the Owners Certificate on Parcel Map Book 100 pages 52 to 58 of Parcel Maps, purporting to irrevocably dedicate in perpetuity for public road purposes, public and public services, the property described therein. (See sheet 2 for Location)

The effect of a Resolution, on said Map, by the Riverside County Board of Supervisors accepting said offer of Dedication for the purpose of vesting title in the County of Riverside on behalf of the public, but not as part of the county-maintained road system.

Cocopah #45. An easement for road and incidental purposes, recorded October 10, 1922 in Book 544 of Deeds, Page 168. (See sheet 2 for Location)

Cocopah #64. An easement for road and incidental purposes, recorded October 3, 1922 in Book 544 of Deeds, Page 168.

Cocopah #111. The effect of a Declaration of Dedication as show by the Owners Certificate on said Parcel Map No. 14453, purporting to irrevocably dedicate in perpetuity for public road purposes, public utility and public services, the property described therein.

The effect of a Resolution, on said Map, by the Riverside County Board of Supervisors accepting said offer of dedication for the purpose of vesting title in the County of Riverside on behalf of the public, but not as part of the county-maintained road system. (Not plottable).

SunWorld #61. An easement for existing public utilities and/or public service facilities and incidental purposes, recorded May 29, 1975 as Instrument No. 62197 of Official Records. (See sheet 2 for Location)

SunWorld #70. An easement shown or dedicated on the map filed or recorded as Parcel Map 14093 in Book 105, Pages 78 through 87 of Parcel Maps. For: Road and public utilities and incidental purposes. (See sheet 2 for Location)

SunWorld #73. An easement shown or dedicated on the map filed or recorded as Parcel Map No. 16920 in Book 112, Pages 44 through 49 of Parcel Maps. For: Road and public utilities and incidental purposes. (See sheet 2 for Location)

Other Easements of Record have been provided by Applicant and can be obtained by contacting the Planner and requesting List of Exceptions and Plotted Easement Maps.

Drainage and Grading Notes:

See attached Preliminary Grading and Drainage Plan. The proposed improvements do not include significant alternation of the land or the existing drainage patterns. No significant hardscape is proposed that would warrant need for onsite retention or detention facilities.

No mass grading is required for site, which is nearly level to gently sloping topography. Light grubbing and minimal grading and trenching would be required where facilities and tracker arrays are proposed. The Project proposes balanced cut/fill grading of 800,000 cubic yards, to grade the 1,000-acre citrus orchard to a depth of 3 inches. In order to aim for balanced cut-and-fill quantities, grading activities may include placement and compaction of excess materials in low-elevation areas of site. Fine grading would be required for development of site access roads.

Installation of the electrical collection system within the arrays would require excavations to a depth of about three feet for underground electrical circuits. Inverter and switchgear enclosure foundations, and transformer foundations. The O&M building foundation would be excavated to a depth of about three feet. Foundations for substation structures and gen-tie towers or poles would be augured to depths of 10 feet for medium-voltage overhead lines to 45 feet for high-voltage overhead lines, depending on structural loads and soil conditions.

Flood Notes:

Land is not subject to overflow, inundation, flood hazard, liquefaction, geologic hazard, or a Special Studies Zone. FEMA maps are not available for subject area. Centerline curve radii and typical sections of open channels are not applicable to project site.

LEGAL DESCRIPTION

PARCEL A: (APN: 824-130-007)
THAT PART OF THAT PORTION OF THE SOUTHWEST QUARTER OF SECTION 34, TOWNSHIP 6 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, ACCORDING TO UNITED STATES GOVERNMENT SURVEY APPROVED OCTOBER 6, 1858, AS SAID PORTION WAS CONVEYED TO THE STATE OF CALIFORNIA BY DEED RECORDED AUGUST 10, 1967, SOUTHERLY OF THE FOLLOWING DESCRIBED LINE:

BEGINNING AT THE SOUTHWESTERLY TERMINATION OF THAT COURSE DESCRIBED AS SOUTH 33°32'18" WEST, 241.29 FEET TO THE SOUTH LINE OF THE NORTHEAST QUARTER OF SAID SOUTHWEST QUARTER IN SAID DEED TO THE STATE OF CALIFORNIA, SAID POINT OF BEGINNING BEING A POINT ON THE EXISTING WESTERLY RIGHT OF WAY HIGHWAY INTERSTATE 10 AND 71.76 FEET RIGHT OF ENGINEERS STATION 2868 PLUS 16.58 OF THE ER LINE OF SAID HIGHWAY; THENCE SOUTH 89°12'33" WEST, 224.65 FEET; THENCE SOUTH 75°14'20" WEST, 610.16 FEET; THENCE NORTH 89°25'15" WEST, 1400.52 FEET TO A POINT 185 FEET RIGHT OF ENGINEERS STATION 276 PLUS 00 OF SAID ER LINE.

EXCEPT THAT PORTION LYING EAST OF THE FOLLOWING DESCRIBED LINE OF THE PALO VERDES IRRIGATION DISTRICT, BEGINNING AT A POINT ON THE SOUTH LINE OF SECTION 34, WHICH POINT IS EAST 509.08 FEET FROM THE SOUTHWEST CORNER THEREOF; THENCE NORTH 20°21'46" EAST 1408.97 FEET, MORE OR LESS TO THE NORTH LINE OF THE SOUTH HALF OF THE SOUTHWEST QUARTER OF SECTION 34, TOWNSHIP 6 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA.

PARCEL B: (APN: 863-040-001-3)
THE NORTHWEST 1/4 OF TRACT NO. 57, SECTION 5, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, SHOWN BY INDEPENDENT RESURVEY OF SAID TOWNSHIP, ACCEPTED BY THE UNITED STATES LAND OFFICE, IN MAY 1919.

PARCEL C: (APN: 863-040-017-7)

PARCEL 1:
THE SOUTH HALF OF TRACT NO. 57, IN SECTION 5, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY INDEPENDENT RESURVEY OF SAID TOWNSHIP, ACCEPTED BY THE UNITED STATES LAND OFFICE, IN MAY 1919.
EXCEPTING THEREFROM THAT PORTION LYING WITHIN THE FOLLOWING DESCRIBED PROPERTY:

LOTS 4 AND 5, IN SECTION 5, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY UNITED STATES INDEPENDENT RESURVEY, APPROVED DECEMBER 18, 1919, TOGETHER WITH THAT PORTION OF THE SOUTH HALF OF TRACT NO. 57, IN SECTION 5, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY INDEPENDENT RESURVEY OF SAID TOWNSHIP, ACCEPTED BY THE UNITED STATES LAND OFFICE, IN MAY, 1919, SAID PORTION LYING SOUTHEASTERLY OF THE FOLLOWING DESCRIBED LINE:

BEGINNING AT THE INTERSECTION OF THE SOUTHERLY LINE OF SAID TRACT NO. 57, WITH THE CENTER LINE OF THAT CERTAIN STRIP OF LAND, 50 FEET IN WIDTH, AS IN THE RIGHT OF WAY EASEMENT TO THE IMPERIAL IRRIGATION DISTRICT, RECORDED FEBRUARY 11, 1954 AS INSTRUMENT NO. 6893, IN BOOK 1553 PAGES 574, 575 AND 576, ALL OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, SAID POINT OF INTERSECTION BEING WEST, 429.78 FEET FROM THE SOUTHEAST CORNER OF SAID TRACT NO. 57; THEN ALONG SAID CENTER LINE, AND IN NORTHEASTERLY PROLONGATIONS THEREOF, NORTH 37° 55' EAST, TO THE EASTERLY LINE OF SAID GOVERNMENT LOT 4.

PARCEL 2:
THAT PORTION OF GOVERNMENT LOTS 4 AND 5, IN SECTION 5, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY UNITED STATES INDEPENDENT RESURVEY, APPROVED DECEMBER 16, 1919, LYING NORTHWESTERLY OF THE FOLLOWING DESCRIBED LINE:

BEGINNING AT THE INTERSECTION OF THE SOUTHERLY LINE OF SAID TRACT NO. 57, WITH THE CENTER LINE OF THAT CERTAIN STRIP OF LAND, 50 FEET IN WIDTH, AS IN THE RIGHT OF WAY EASEMENT TO THE IMPERIAL IRRIGATION DISTRICT, RECORDED FEBRUARY 11, 1954 AS INSTRUMENT NO. 6893, IN BOOK 1553 PAGES 574, 575 AND 576, ALL OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, SAID POINT OF INTERSECTION BEING WEST, 429.78 FEET FROM THE SOUTHEAST CORNER OF SAID TRACT NO. 57; THEN ALONG SAID CENTER LINE, AND IN NORTHEASTERLY PROLONGATIONS THEREOF, NORTH 37° 55' EAST, TO THE EASTERLY LINE OF SAID GOVERNMENT LOT 4.

PARCEL 3:
INTENTIONALLY DELETED

PARCEL 4:
INTENTIONALLY DELETED

PARCEL D: (APN: 824-090-009-0)
THE SOUTHWEST QUARTER OF THE SOUTHEAST QUARTER OF SECTION 32, TOWNSHIP 6 SOUTH, RANGE 23 EAST, SAN BERNARDINO BASE AND MERIDIAN, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, ACCORDING TO UNITED STATES GOVERNMENT SURVEY.
EXCEPTING THEREFROM PORTION DESIGNATED FOR STATE HIGHWAY PURPOSES, AS SET FORTH IN THAT CERTAIN FINAL ORDER OF CONDEMNATION RECORDED MARCH 27, 1956 AS INSTRUMENT NO. 28928, OFFICIAL RECORDS OF SAID RIVERSIDE COUNTY.

PARCEL D1:
INTENTIONALLY DELETED

PARCEL D2:
INTENTIONALLY DELETED

PARCEL E: (APN: 863-050-009-1)
THAT PORTION OF PARCEL 11, INCLUSIVE, OF PARCEL MAP 14453, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, AS SHOWN BY PARCEL MAP ON FILE IN BOOK 100, PAGES 53 THROUGH 58, INCLUSIVE, OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, DESCRIBED AS FOLLOWS:

COMMENCING AT THE NORTHWEST CORNER OF PARCEL 11 OF PARCEL MAP NUMBER 14453 AS RECORDED IN BOOK 100 AT PAGES 52 THROUGH 58 OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA; THENCE NORTH 89° 14' 22" EAST, 2242.89 FEET; THENCE SOUTH 38° 58' 48" WEST, 477.84 FEET; THENCE SOUTH 89° 14' 22" WEST, 1800.31 FEET TO THE WESTERLY LINE OF PARCEL 11; THENCE NORTH 0° 46' 13" WEST ALONG THE WEST LINE OF PARCEL 11, 377.57 FEET TO THE POINT OF BEGINNING.

EXCEPTING THEREFROM THAT PORTION FOR PUBLIC STREET AND UTILITY PURPOSES OVER THAT PORTION OF THE LAND WITHIN LAND EASEMENTS SHOWN AS 15TH AVENUE, AS SHOWN OR DEDICATED UPON THE MAP OF PARCEL MAP 14453 ON FILE IN BOOK 100, PAGES 52 THROUGH 58 OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.

PARCEL F: (APN: 863-100-016-1)
PARCEL 18 OF PARCEL MAP NO. 14,453 FILED JANUARY 21, 1982 IN BOOK 100 PAGES 52 THROUGH 58, OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, EXCEPTING THEREFROM THAT PORTION DESCRIBED AS FOLLOWS:
BEGINNING AT THE CENTERLINE OF THE INTERSECTION OF 16TH AVENUE AND KEIM BOULEVARD AS SHOWN ON SAID PARCEL MAP 14,453;
THENCE NORTH 89° 06' 19" EAST ALONG THE CENTERLINE OF 16TH AVENUE A DISTANCE OF 218.58 FEET TO THE NORTHEAST CORNER OF SAID PARCEL 18;
THENCE SOUTH 01° 32' 20" EAST ALONG THE EASTERLY LINE OF SAID PARCEL 18 A DISTANCE OF 750.00 FEET;
THENCE SOUTH 89° 06' 19" WEST CONTINUING ON THE LOT LINE OF SAID PARCEL 18, A DISTANCE OF 75.00 FEET;
THENCE SOUTH 01° 32' 20" EAST ALONG THE EASTERLY LINE OF SAID PARCEL 18 A DISTANCE OF 1088.58 FEET TO THE SOUTHEASTERLY CORNER OF SAID PARCEL 18;
THENCE SOUTH 88° 56' 54" WEST ALONG THE SOUTHERLY LINE OF SAID PARCEL 18 A DISTANCE OF 1060.60 FEET TO A POINT ON THE CENTERLINE OF SAID KEIM BOULEVARD;
THENCE NORTH 01° 32' 20" WEST ALONG THE CENTERLINE OF SAID KEIM BOULEVARD A DISTANCE OF 498.51 FEET;
THENCE NORTH 03° 25' 40" WEST CONTINUING ALONG THE CENTERLINE OF SAID KEIM BOULEVARD A DISTANCE OF 1321.54 FEET TO THE POINT OF BEGINNING.
THIS DEED IS GIVEN PURSUANT TO LOT LINE ADJUSTMENT NO. 1747 APPROVED BY THE RIVERSIDE COUNTY PLANNING DEPARTMENT DATED AUGUST 24, 1983 WHEREIN THAT PORTION OF PARCEL 18 EXCEPTED FROM PARCEL "F" ABOVE BECOMES A PART OF PARCEL 14.

PARCEL F1:
AN EASEMENT FOR PUBLIC STREET AND UTILITY PURPOSES OVER THAT PORTION OF THE LAND WITHIN ROAD EASEMENTS SHOWN AS BUTCH AVENUE, 14TH AVENUE, 15TH AVENUE, 16TH AVENUE, AND KEIM BOULEVARD, AS SHOWN OR DEDICATED UPON THE MAP OF PARCEL MAP 14,453 RECORDED IN BOOK 100 PAGES 52 THROUGH 58 OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA;
EXCEPTING THEREFROM THOSE ROAD EASEMENTS LYING WITHIN PARCEL "F" ABOVE.

PARCEL G: (APN'S: 863-100-005-1 AND 863-100-009-2)
THAT PORTION OF GOVERNMENT TRACT NO. 57, IN SECTION 5, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN ON THE SUPPLEMENTAL DIAGRAM OF THE SURVEY OF ENTRIES, INDEPENDENT RESURVEY ACCEPTED MAY 10, 1919, BY THE GOVERNMENT LAND OFFICE, LYING OUTSIDE OF THE PALO VERDE IRRIGATION DISTRICT BOUNDARY, AS THAT BOUNDARY EXISTED ON FEBRUARY 12, 1948;
EXCEPTING THAT PORTION, IF ANY, LOCATED IN THE EASTERLY 1182.6 FEET OF TRACT NO. 67.

PARCEL H: (APN'S: 824-090-024; 824-102-013 THROUGH 824-102-016; 863-080-015 THROUGH 863-080-018; 863-040-015; 863-050-004; 863-050-007; 863-050-008; 863-070-018; 863-070-019; 863-070-022; 863-100-008 THROUGH 863-100-012)
PARCELS 1 THROUGH 18, INCLUSIVE, AND PARCELS 19 THROUGH 33, INCLUSIVE, OF PARCEL MAP 14453, AS SHOWN BY MAP ON FILE IN BOOK 100 PAGE(S) 52 THROUGH 58, INCLUSIVE, OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA;
EXCEPTING THEREFROM THAT PORTION OF LOT 11 OF PARCEL MAP 14453, AS DEEDED TO KARIN HESSELBERG, GEE. SEIDL, A MARRIED WOMAN AS TO AN UNDIVIDED 1/6 INTEREST; WALTER LUCAS, A SINGLE MAN AS TO AN UNDIVIDED 1/6 INTEREST; HEINZ NORDMANN, A MARRIED MAN AS TO AN UNDIVIDED 1/6 INTEREST; HORNER DITTMANN, A MARRIED MAN AS TO AN UNDIVIDED 1/6 INTEREST; HERMANN CLASEN, A MARRIED MAN AS TO AN UNDIVIDED 1/6 INTEREST; AND STEFFEN DITTMANN, A MARRIED MAN AS TO AN UNDIVIDED 1/6 INTEREST, ALL AS TENANTS IN COMMON, BY DEED RECORDED OCTOBER 11, 1988 AS INSTRUMENT NO. 293738 OF OFFICIAL RECORDS; PURSUANT TO LOT LINE ADJUSTMENT CASE NO. 2184 APPROVED BY THE RIVERSIDE COUNTY PLANNING DEPARTMENT ON AUGUST 18, 1988.

PARCEL H1:
A NON-EXCLUSIVE EASEMENT FOR THE PURPOSE OF INGRESS AND EGRESS AND IRRIGATION INCLUDING THE RIGHT TO USE, MAINTAIN, REPAIR, RECONSTRUCT, ENLARGE AND OR INSTALL ROADS, IRRIGATION DITCHES, UTILITY SERVICES AND OR PIPELINES WITHIN SAID WESTERLY 100 FEET OF THE FOLLOWING DESCRIBED PROPERTY:
THE SOUTH HALF OF TRACT 68 IN SECTION 9, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY UNITED STATES INDEPENDENT RESURVEY APPROVED DECEMBER 16, 1919 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA;
EXCEPTING THEREFROM THE NORTHERLY 30 ACRES.

PARCEL H2:
A NON-EXCLUSIVE EASEMENT FOR CONVEYANCE OF WATER THROUGH EXISTING CANAL, PIPES, AND PUMPING SYSTEM FOR IRRIGATION OVER AND ACROSS THE SOUTHERLY PORTION OF THE FOLLOWING SAID PROPERTY:
THAT PORTION OF THE NORTH HALF OF THE NORTHWEST QUARTER OF SECTION 3, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, BEING ALSO SHOWN AS THE WEST TWO-THIRDS OF TRACT 48 OF SECTION 3, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY UNITED STATES GOVERNMENT SURVEY ACCEPTED MAY 10, 1919, LYING WEST OF THE MID-LINE OF THE PALO VERDE IRRIGATION DISTRICT'S DRAINAGE CANAL, DESIGNATED AS RUNNELL'S DRAIN ON RECORD OF SURVEY ON FILE IN BOOK 17 PAGE 48 OF RECORDS OF SURVEY, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, AS CONVEYED TO G.B. INVESTMENT CO., AN ARIZONA CORPORATION, BY DEED FROM J.E. HASON AND WIFE, RECORDED MAY 3, 1967, AS INSTRUMENT NO. 37728 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.

PARCEL H3:
AN EASEMENT FOR PUBLIC STREET AND UTILITY PURPOSES OVER THAT PORTION OF THE LAND WITHIN ROAD EASEMENTS SHOWN AS BUTCH AVENUE, 14TH AVENUE, 15TH AVENUE, 16TH AVENUE AND KEIM BOULEVARD, AS SHOWN OR DEDICATED UPON THE MAP OF PARCEL MAP 14,453 ON FILE IN BOOK 100 PAGES 52 THROUGH 58 OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA;
EXCEPTING THEREFROM THOSE ROAD EASEMENTS LYING WITHIN PARCEL H AND PARCEL L.
SAID PARCEL MAP 14,453 BEING A DIVISION OF A PORTION OF SECTIONS 32 AND 33, TOWNSHIP 6 SOUTH, RANGE 23 EAST AND A PORTION OF SECTIONS 4, 5, 8 AND 9, TOWNSHIP 7 SOUTH, RANGE 22 EAST SAN BERNARDINO BASE AND MERIDIAN.

PARCEL I: (APN: 824-130-006-0)
THE WEST 30 FEET OF THE SOUTHWEST QUARTER OF THE SOUTHWEST QUARTER OF SECTION 34, TOWNSHIP 6 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN.
EXCEPTING THEREFROM THAT PORTION DESCRIBED BY FINAL ORDER OF CONDEMNATION RECORDED SEPTEMBER 4, 1998 AS INSTRUMENT NO. 85686 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.

PARCEL J: (APN'S: 863-040-022-9 AND 863-040-021-0)
THAT PORTION OF THE NORTH HALF OF SECTION 5, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN DESCRIBED AS FOLLOWS:

COMMENCING AT THE WESTERLY COMMON PARCEL CORNER OF PARCEL 1 AND PARCEL 10 OF PARCEL MAP NO. 14453 AS RECORDED IN BOOK 100 AT PAGE 52 THROUGH 58 RECORDS OF RIVERSIDE COUNTY CALIFORNIA; THENCE SOUTH 1° 50' 48" EAST ALONG THE WEST LINE OF PARCEL 10 A DISTANCE OF 384.20 FEET TO THE TRUE POINT OF BEGINNING; THENCE CONTINUING SOUTH 0° 50' 48" EAST ALONG THE WEST LINE OF PARCEL 10 A DISTANCE OF 2580.00 FEET TO THE NORTH CORNER OF PARCEL 17; THENCE SOUTH 0° 50' 48" EAST 1960.07 FEET TO THE SOUTHEAST CORNER OF PARCEL 17; THENCE SOUTH 88° 56' 18" WEST ALONG THE SOUTH LINE OF PARCEL 17 A DISTANCE OF 1321.68 FEET; THENCE SOUTH 89° 14' 22" WEST ALONG THE SOUTH LINE OF PARCEL 17, A DISTANCE OF 256.00 FEET TO THE WEST CORNER OF PARCEL 17; THENCE CONTINUING SOUTH 89° 14' 22" WEST ALONG THE NORTH LINE OF PARCEL 11, A DISTANCE OF 148.00 FEET; THENCE NORTH 39° 58' 48" EAST 2813.68 FEET TO THE TRUE POINT OF BEGINNING. SAID PROPERTY INCLUDES ALL OF PARCEL 17 OF PARCEL NO. 14453 AS SHOWN ON MAP ON FILE IN BOOK 100 PAGES 52 THROUGH 58 INCLUSIVE, OF PARCEL MAPS, RIVERSIDE COUNTY RECORDS.
A CERTIFICATE OF LOT LINE ADJUSTMENT NO. 2183 WAS APPROVED AUGUST 19, 1985.

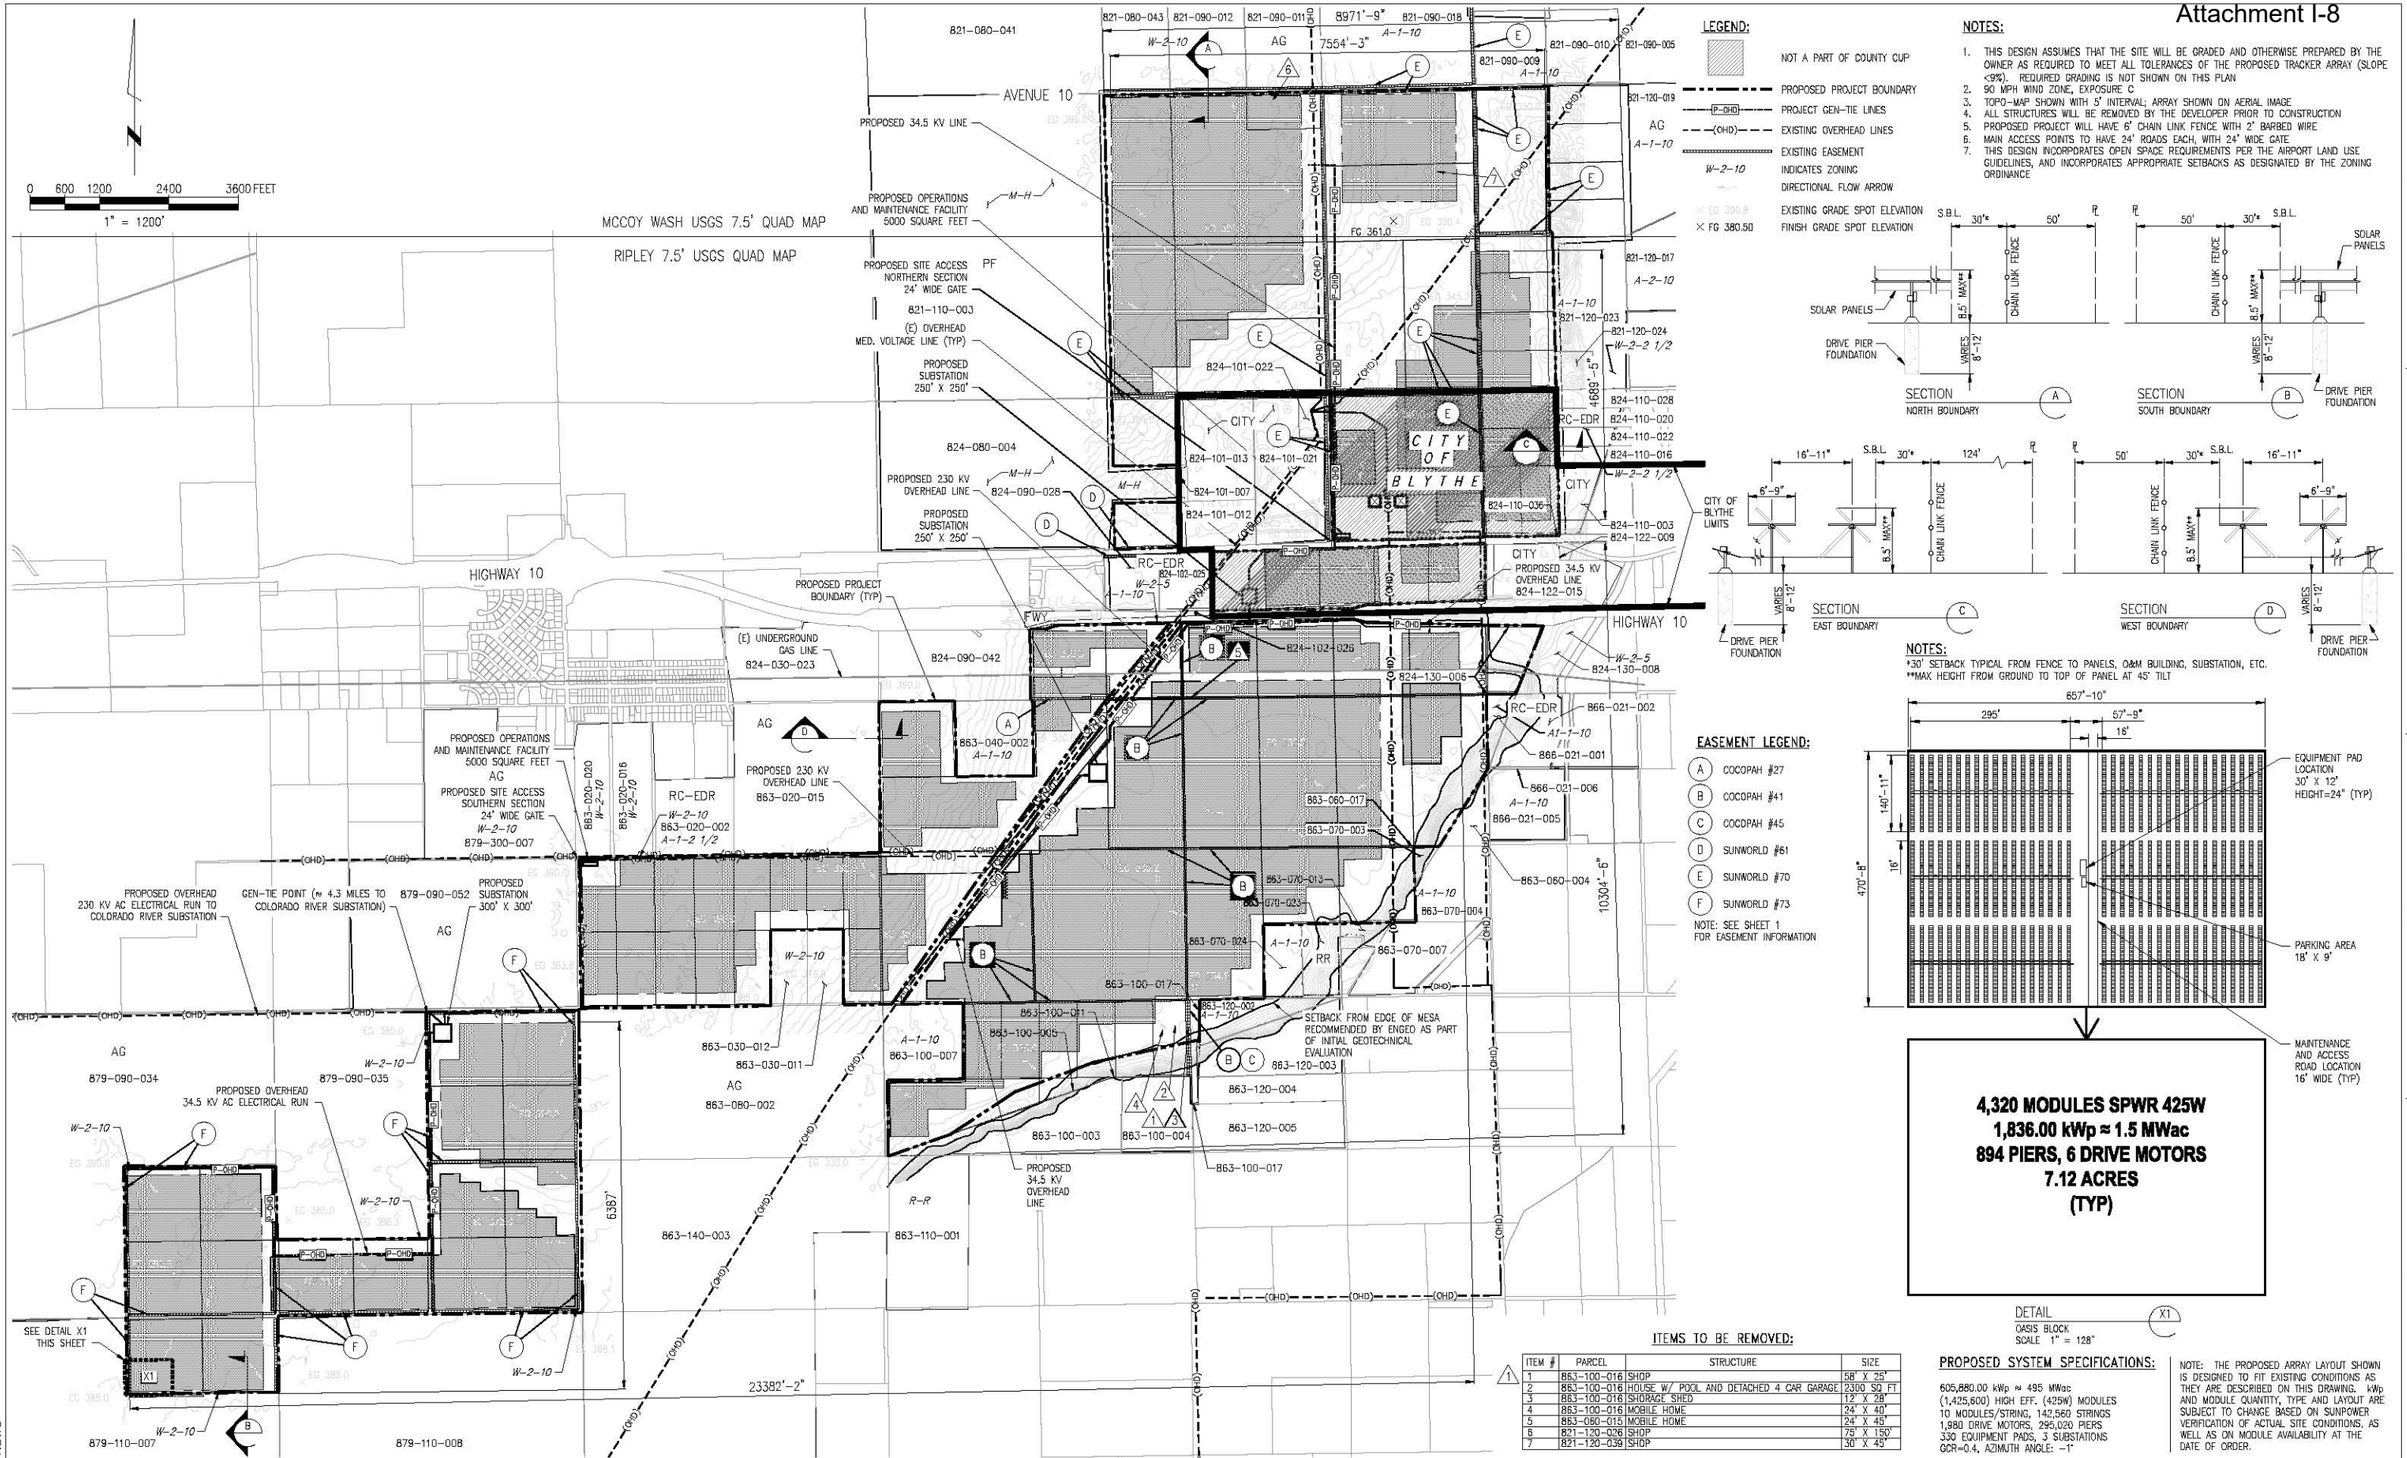
PARCEL J1:
A NON EXCLUSIVE EASEMENT FOR THE PURPOSE OF INGRESS AND EGRESS AND IRRIGATION INCLUDING THE RIGHT TO USE, MAINTAIN, REPAIR, RECONSTRUCT, ENLARGE AND OR INSTALL ROADS, IRRIGATION DITCHES, UTILITY SERVICES AND OR PIPELINES WITHIN SAID WESTERLY 100 FEET OF THE FOLLOWING DESCRIBED PROPERTY:
THE SOUTH HALF OF TRACT 88 IN SECTION 9 TOWNSHIP 7 SOUTH RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN AS SHOWN BY UNITED STATES INDEPENDENT RESURVEY APPROVED DECEMBER 16, 1919 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.
EXCEPTING THEREFROM THE NORTHERLY 30 ACRES.

PARCEL J2:
A NON EXCLUSIVE EASEMENT FOR CONVENIENCE OF WATER THROUGH EXISTING CANAL, PIPES, AND PUMPING SYSTEM FOR IRRIGATION OVER AND ACROSS THE SOUTHERLY PORTION OF THE FOLLOWING SAID PROPERTY;
THAT PORTION OF THE NORTH HALF OF THE NORTHWEST QUARTER OF SECTION 3, TOWNSHIP 7, SOUTH RANGE 22 EAST SAN BERNARDINO BASE AND MERIDIAN BEING ALSO SHOWN AS THE WEST TWO-THIRDS OF TRACT 48 OF SECTION 3 TOWNSHIP 7 SOUTH RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN AS SHOWN BY UNITED STATES GOVERNMENT SURVEY ACCEPTED MAY 10, 1919, LYING WEST OF THE MID-LINE OF THE PALO VERDE IRRIGATION DISTRICT'S DRAINAGE CANAL, DESIGNATED AS RUNNELL'S DRAIN ON RECORD OF SURVEY ON FILE IN BOOK 17 PAGE 48 OF RECORDS OF SURVEY, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, AS CONVEYED TO G.B. INVESTMENT CO., AN ARIZONA CORPORATION, BY DEED FROM J.E. HASON AND WIFE, RECORDED MAY 3, 1967, AS INSTRUMENT NO. 37728 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.

PARCEL J3:
AN EASEMENT FOR PUBLIC STREET AND UTILITY PURPOSE OVER THAT PORTION OF THE LAND WITHIN ROAD EASEMENTS SHOWN AS BUTCH AVENUE, 14TH AVENUE, 15TH AVENUE, 16TH AVENUE AND KEIM BOULEVARD, AS SHOWN OR DEDICATED UPON THE MAP OF PARCEL MAP 14453 ON FILE IN BOOK 100 PAGES 52 THROUGH 58 OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.
EXCEPTING THEREFROM THOSE ROAD EASEMENTS LYING WITHIN PARCEL A ABOVE.

PARCEL K: (APN'S: 866-021-007-5 AND 866-022-002-8)
THE SOUTH 40 FEET OF THE NORTH 80 FEET OF THE WEST HALF OF THE NORTHWEST QUARTER OF SECTION 3, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY UNITED STATES GOVERNMENT SURVEY APPROVED MAY 10, 1919 THE NORTH HALF OF SAID NORTHWEST QUARTER BEING SHOWN AS THE WEST TWO-THIRDS OF TRACT 48 IN SAID SECTION 3;

EXCEPTING THEREFROM THE PORTION WHICH LIES WEST OF THE MID-LINE OF THE PALO VERDE IRRIGATION DISTRICT'S DRAINAGE CANAL, DESIGNATED AS RANNELL'S DRAIN BY RECORD OF SURVEY ON FILE IN BOOK 17 PAGE 48 OF RECORDS OF SURVEY, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, THAT CROSSES SAID PROPERTY;
ALSO EXCEPTING THEREFROM THE EAST 30 FEET; ALSO EXCEPTING THEREFROM ANY PORTION LYING WITHIN STEPHENSON BOULEVARD.



PARCEL L: (APN: 863-100-017-2)
THAT PORTION OF PARCEL 18 OF PARCEL MAP 14,453, AS SHOWN BY MAP ON FILE IN BOOK 100 PAGE(S) 52 THROUGH 58, INCLUSIVE, OF PARCEL MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA;

BEGINNING AT THE CENTERLINE OF THE INTERSECTION OF 16TH AVENUE AND KEIM BOULEVARD AS SHOWN ON SAID PARCEL MAP 14,453; THENCE NORTH 89° 06' 19" EAST ALONG THE CENTERLINE OF 16TH AVENUE, A DISTANCE OF 218.58 FEET TO THE NORTHEAST CORNER OF SAID PARCEL 18; THENCE SOUTH 01° 32' 20" EAST ALONG THE EASTERLY LINE OF SAID PARCEL 18, A DISTANCE OF 750.00 FEET; THENCE SOUTH 89° 06' 19" WEST CONTINUING ON THE LOT LINE OF SAID PARCEL 18, A DISTANCE OF 75.00 FEET; THENCE SOUTH 01° 32' 20" EAST ALONG THE EASTERLY LINE OF SAID PARCEL 18, A DISTANCE OF 1088.58 FEET TO THE SOUTHEASTERLY CORNER OF SAID PARCEL 18; THENCE SOUTH 88° 56' 54" WEST ALONG THE SOUTHERLY LINE OF SAID PARCEL 18, A DISTANCE OF 100.00 FEET TO A POINT ON THE CENTERLINE OF SAID KEIM BOULEVARD; THENCE NORTH 01° 32' 20" WEST ALONG THE CENTERLINE OF SAID KEIM BOULEVARD, A DISTANCE OF 498.51 FEET; THENCE NORTH 03° 25' 40" WEST CONTINUING ALONG THE CENTERLINE OF SAID KEIM BOULEVARD, A DISTANCE OF 1321.54 FEET TO THE POINT OF BEGINNING, AS PER LOT LINE ADJUSTMENT NO. 1747 DATED AUGUST 24, 1983.

PARCEL L1:
A NON-EXCLUSIVE EASEMENT OF CONVEYANCE OF WATER THROUGH EXISTING CANAL, PIPES, AND PUMPING SYSTEM FOR IRRIGATION OVER AND ACROSS THE SOUTHERLY PORTION OF THE FOLLOWING SAID PROPERTY;

THAT PORTION OF THE NORTH HALF OF THE NORTHWEST QUARTER OF SECTION 3, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, BEING ALSO SHOWN AS THE WEST TWO-THIRDS OF TRACT 48 OF SECTION 3, TOWNSHIP 7 SOUTH, RANGE 22 EAST, SAN BERNARDINO BASE AND MERIDIAN, AS SHOWN BY UNITED STATES GOVERNMENT SURVEY ACCEPTED MAY 10, 1919, LYING WEST OF THE MID-LINE OF THE PALO VERDE IRRIGATION DISTRICT'S DRAINAGE CANAL, DESIGNATED AS RUNNELL'S DRAIN ON RECORD OF SURVEY ON FILE IN BOOK 17 PAGE 48 OF RECORDS OF SURVEY, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, AS CONVEYED TO G.B. INVESTMENT CO., AN ARIZONA CORPORATION, BY DEED FROM J.E. HASON AND WIFE, RECORDED MAY 3, 1967, AS INSTRUMENT NO. 37728 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.

NOTICE OF PREPARATION
ATTACHMENT A

BLYTHE MESA SOLAR PROJECT

1.0 DESCRIPTION OF THE PROPOSED PROJECT

Project Location
The proposed Blythe Mesa Solar Project (Project) is located in the Palo Verde Valley area of eastern Riverside County, approximately 5 miles west of the City of Blythe and 40 miles east of Desert Center **(Figure 1).** The Project would be located north and south of Interstate 10, and west of State Route 89 and Highway 95. The site consists primarily of agricultural land located south and east of the community of Nicholls Warm Springs/Mesa Verde.

Project Description
The proposed 485 megawatt (MW) photovoltaic (PV) electrical generating facility and 8.4-mile transmission line would occupy a total of 3,660 acres. The proposed Project would produce enough energy to power approximately 180,000 households, and consist of the following components **(see Figure 2)**:

- Solar array field utilizing single-axis solar PV trackers
- System of interior collection power lines located between inverters and substations
- Three on-site substations (approximately 300 feet long by 300 feet wide each)
- Two operation and maintenance (O&M) buildings (approximately 3,500 square feet each)
- Two primary off-site access roads and several interior access roads
- 8.4 miles of 230 kilovolt (kV) double-circuit transmission line

The fenced-in solar field would occupy 3,587 acres of private land, 334 acres of which are within the City of Blythe. Within this area, a 230 kV transmission line would connect all three proposed substations, extending a distance of approximately 3.6 miles on site. The transmission line would extend another 4.8 miles within a 125-foot-wide right-of-way (or 73 acres) from the southernmost substation to the Colorado River Substation, traversing 3.8 miles of BLM managed lands (58 acres) and one mile of private land (15 acres).

Project Objectives
The objectives for the Blythe Mesa Solar Project are as follows:

- Construct a solar energy facility in order to help meet State and federal renewable energy standards and goals.
- Assist with Greenhouse Gas reduction objectives to the maximum extent possible.
- Locate the Project facilities as near as possible to electrical transmission facilities with anticipated capacity and a reserved California Independent System Operator (CAISO) interconnection position.
- Site the Project in an area with excellent solar energy resources in order to maximize energy productivity from the PV panels.
- To the extent feasible, site the Project on previously disturbed land with compatible topography and in a manner that minimizes environmental impacts.

- Use a proven and available solar PV technology.

Land Use Considerations
The proposed Project would be situated predominantly in the County of Riverside (as shown on **Figure 1**). The Riverside County General Plan (Palo Verde Area Plan) applies Agriculture and Rural Community land use designations to the proposed Project site. Parcels are currently zoned W-2-10 (Controlled Development Areas) (10 Acre Min.), W-2-5 (Controlled Development Areas), A-1-10 (Light Agriculture), and A-2-10 (Heavy Agriculture). The County of Riverside Planning Department has indicated that the proposed Project would be conditionally consistent with the agricultural land use designation, subject to issuance of a conditional use permit (CUP). A Development Agreement between the County of Riverside and the applicant will be established setting forth the rights and responsibilities of each party with respect to project development and operation.

A portion (334 acres) of the proposed Project site is located within the City of Blythe's incorporated boundary and Sphere of Influence. The City of Blythe designates the Project lands within the city as Service Industrial and Agricultural. The proposed Project would be a consistent use, subject to issuance of a CUP.

A portion (73 acres) of the proposed transmission line alignment between the Project site and the Colorado River Substation site is federal land under the jurisdiction of the U.S. Department of the Interior, Bureau of Land Management (BLM). A Right of Way Grant from BLM would be required for construction of the 230 kV transmission line on BLM-managed public land.

Project Components
Solar Array Field
The Project would utilize single-axis PV trackers with 1,425,600 high-efficiency, monocrystalline, silicon solar panels. The panels would be configured into trackers and the trackers configured into blocks (refer to the **Solar Module** inset in the right-hand corner of **Figure 2**). Each block would comprise six trackers with 18 north-south oriented rows of PV panels. The trackers would rotate up to 45 degrees from east to west to follow the daily motion of the sun, with the center of rotation being approximately four to eight feet above grade (refer to **Figure 3, Typical Tiled Tracker Panels**). Torque tubes would act as the horizontal support for the PV panels and would be in turn supported by micro-piles (15 to 20 feet long and having a 4.5-inch outer diameter), which would be driven directly into the ground and able to withstand high-wind conditions. The metal structural elements would be constructed of corrosion-resistant galvanized steel.

The support structure for panels would be constructed by first driving micro-piles into the ground to a depth of 8 to 12 feet using a vibration technology to reduce noise impacts. Torque tubes, electrical wire trays, and panels would then be installed on the piles. Concrete foundations for the drive motors (devices used to move drive struts back and forth) would be poured in place, and electrical equipment for the array would be set in place. A tracked backhoe would dive piles. No blasting or rock breaking is anticipated or proposed. Small truck-mounted cranes or grade-all forklifts would place trackers on support piles.

Combiners, Inverters, and Transformers
Individual PV panels would be connected together in series to create a "string" to carry direct current (DC) electricity. Multiple DC strings would be brought together into an above-ground combiner box to merge the strings into a single high-current cable and provide overcurrent protection. From the combiner boxes, the cabling would run in raceways and underground to electrical inverters, which take the DC output from the combiner boxes and convert it to alternating current (AC) electricity.

The AC electricity would be increased to medium voltage with a "step-up" transformer. The medium-voltage (34.5 kV) collection lines would begin at the inverter/transformer pads and would be located in trenches until the output from 10 to 15 blocks is gathered and transferred at risers to a system of overhead medium-voltage collection lines for transmission to the substation. The medium voltage collection circuits would be mounted above ground on poles (35 to 60 feet tall) with an average tower-to-tower span of 200 feet, and would carry 20 to 30 MW of electricity.

Substation and Switchgear Pads

The three Project substations (each approximately 300 feet long by 300 feet wide) would collect all the medium-voltage circuits and would contain metering equipment, switchgear, protective relays, and larger transformers to step up the voltage to match the voltage of the transmission grid at the interconnection point (the Colorado River Substation). The Project substations and the interconnection point would be linked by a 230 kV transmission line. This line would cross over Interstate 10 at a point approximately 2.6 miles east of the Mesa Drive/Interstate 10 interchange.

The construction of the substations would involve site preparation, clearing of the switchyard site, and installation of substructures and electrical equipment. The substation site would be initially cleared and graded. A security fence would be installed around the substation. Grading would establish the desired site grade, and minor excavation would provide concrete footings for the substation equipment. Gravel would be spread inside the fence of the substation sites.

Operation and Maintenance Buildings

The two O&M buildings (approximately 3,500 square feet each, enclosed, and no more than 20 feet tall) would provide work space for maintenance staff and storage space for spare parts. The building would include bathroom facilities serviced by a private septic system and would be designed for occupancy Classification U. The buildings would be made of prefabricated steel on a concrete slab foundation.

Site Security Fencing

The entire Project site would be enclosed with fencing that meets National Electrical Safety Code (NESC) for protective arrangements in electric supply stations, such as a seven-foot equestrian-type wire fence. The fence would typically be set 30 feet from the arrays or the property boundary.

Access Roads

Two primary access points to the Project site are planned on Seeley Avenue and Riverside Drive, both from the Neighbors Boulevard off-ramp at Interstate 10.

Within the solar field, dirt access roads 12 feet wide would be constructed approximately every 200 to 400 feet to allow access and maintenance of the solar panels.

230 kV Transmission Line Interconnect

An approximately 8.4-mile-long 230 kV double-circuit overhead electric transmission line would be constructed from the easternmost substation on the Project site to the approved Colorado River Substation. The 230 kV transmission line would connect all three proposed substations, extending a distance of approximately 3.6 miles within the solar field site. From the westernmost substation to the Colorado River Substation, the transmission line would extend another 4.8 miles within a 125-foot-wide right-of-way (or 73 acres) traversing 3.8 miles of BLM-managed lands (58 acres) and one mile of private land (15 acres).

The transmission line would run parallel and immediately south of the approved Desert Southwest Transmission Line corridor. The Project has secured an interconnection queue position sufficient for the size of the Project at the Colorado River substation and has made the necessary reservation deposits to CAISO.

The transmission line facilities would include a single set of tubular steel poles that would be 85 to 125 feet tall, with an average distance between poles of 500 to 800 feet. Structure heights and corresponding span lengths would be selected to meet Federal Aviation Administration (FAA) requirements for the nearby Blythe Airport. The poles would be directly embedded in the soil or set in concrete foundations approximately 20 to 30 feet deep. Temporary access roads to each structure would be 16 to 20 feet wide by 8 inches deep of gravel over compacted sub-grade and located within the proposed right-of-way.

General Construction Process

Site Preparation

The PV system proposed for the site can operate on slopes up to nine percent. Since most of the site has nearly level to gently sloping topography, no mass grading would be required. Some of the proposed parcels for facilities and arrays would require light grubbing for leveling and trenching. Access roads would require minimal grading. In order to aim for balanced cut-and-fill quantities, grading activities may include placement and compaction of excess materials in low-elevation areas of the site.

Minor demolition of existing site structures (e.g., storage buildings in the citrus grove) would be required; however, where possible, existing on-site buildings would be used for O&M facilities or for equipment storage.

Installation of the electrical collection system would require excavations to a depth of about three feet for underground electrical circuits, inverter and switchgear enclosure foundations, and transformer foundations. The O&M building foundation would be excavated to a depth of about three feet.

Construction Activities

The Project would be constructed in the following phases, which would occur simultaneously on different portions of the site:

- Development of staging areas and assembly areas, and grading of site access roads.
- Construction of arrays including the pile installation, the assembly of trackers, the mounting of PV panels, and the pile-driving of support piles, placement of trackers on support piles, and trenching and installation of electrical equipment for arrays.
- Construction of electrical transmission facilities, including the construction of three substations, the double-circuit transmission line, and two O&M buildings.

Construction staging and material lay-down would be distributed across the Project site to allow for efficient distribution of components to different parts of the Project. Typically, one staging and material lay-down area would be set up for every 100 acres of the Project site. These lay-down areas would be fenced and would cover approximately five acres each. Lay-down areas would be temporary and would be converted to solar arrays as work is completed in the general area. Within the solar field, grubbing and light grading of 12-foot-wide access roads would also be performed approximately every 200 to 400 feet to allow access to and maintenance of the solar panels.

Separate activities would be associated with transmission line construction, including: (1) construction of staging areas for trailers, office personnel, equipment, material staging, lay-down and employee parking on private land; (2) construction of access roads to the structure locations; (3) pole erection and

installation of conductors and conductor hardware; (4) conductor installation; (5) construction of pulling sites to install conductors; and (6) installation of the overhead ground/fiber optic communications system.

Construction Sequence, Equipment, and Workforce

Construction is anticipated to occur over a three-year period with the construction phases (described above) occurring simultaneously. The solar field would be developed in six-month phases with six blocks constructed at a time (each block would be 100 acres, for a total of 600 acres at a time). As the arrays are being assembled, construction of the substations, transmission line, switchyard, and O&M buildings would also occur simultaneously. After the common facilities are completed in the earlier stages, the workforce would be devoted more to array construction in the later stages.

Approximately 300 to 500 daily workers would be present on site during construction over the construction period. Workers would gain primary access to the site using Seeley Avenue and Riverside Drive off of Neighbors Boulevard. Worker construction traffic would consist of approximately 150 to 250 daily vehicle roundtrips. It is anticipated that most workers would be drawn from the Blythe/Palo Verde Valley and the Desert Center regions, with a smaller portion drawn from the Imperial Valley or Eastern Riverside County regions. Anticipated average daily material deliveries would consist of about 40 truck deliveries per day for 24 months. Workers and delivery trucks would access site using the Neighbors Boulevard off ramp off Interstate 10. On-site work hours would be from 7:00 a.m. to 7:00 p.m. During the installation period, construction workers are projected to be on site five days per week, year round. Due to weather or other major types of delays, times may shift to start as early as 5:00 a.m. and end as late as 8:00 p.m., and work may continue on weekends. In extreme circumstances, work may be performed as many as 24 hours per day, although is not anticipated. Security would likely be onsite 24 hours per day.

Operation and Maintenance Activities

After the construction phase, the O&M building would serve as the Project's operations center for approximately 12 permanent full-time employees, which would include one plant manager, five engineers/technicians, and six security staff. The Project facilities would be monitored during operating (daylight) hours, even though the Project facilities would be capable of automatic start-up, shutdown, self-diagnosis, and fault detection.

The panels may be cleaned up to two times per year, if necessary to optimize output. Each cleaning would require a total of 5 acre-feet of water for a total usage of about 10 acre-feet of water per year (approximately 1.1 gallons per panel per year). No chemicals would be used during cleaning. The Project would work with Gila Farm Land, LLC (the landowner) and the Palo Verde Irrigation District for water services and supply during operation.

No heavy equipment would be used during normal operation. O&M vehicles would include trucks (pickup and flatbed), forklifts, and loaders for routine and scheduled maintenance and water trucks for solar panel washing. Large heavy-haul transport equipment may be brought to the Project site infrequently for equipment repair or replacement.

Long-term maintenance schedules would be developed to include periodic maintenance and equipment replacement in accordance with manufacturer recommendations. Solar panels are warranted for 25 years or longer and are expected to have a life of 30 or more years, with a degradation rate of 0.5% per year. Moving parts, such as motors and tracking module drive equipment, motorized circuit breakers and disconnects, and inverter ventilation equipment, would be serviced on a regular basis, and unscheduled maintenance would be performed as necessary.

The Project site would be secured 24 hours per day by onsite private security personnel or remote security services with motion-detection cameras.

2.0 ENVIRONMENTAL TOPICS TO BE ADDRESSED

Introduction
The County of Riverside has determined that an Environmental Impact Report (EIR) shall be prepared to address the potential significant impacts of the proposed BMSP. The EIR will involve research, analysis, and study of the following environmental topics:

- Aesthetics/Visual Resources
- Agricultural and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Traffic and Circulation
- Utilities and Service Systems

The EIR will include all topical areas of content required by the California Environmental Quality Act (CEQA), including cumulative impacts, alternatives to the proposed Project, and growth-inducing impacts. For each resource topic, environmental impacts relating to construction, operations, and decommissioning phases of the Project will be identified; however, the level of analysis to be included may vary based on the complexity of the issues, public and agency input to this Notice of Preparation (NOP), and/or refinements to the Project description that may occur subsequent to the publication of this NOP. For impacts that are significant, mitigation measures will be proposed to alleviate or avoid the significant impact(s).

Aesthetics
Placement of PV solar panels, the transmission line, and other Project facilities may alter the views of the Project area. Potential visual impacts of this Project on sensitive receptors and scenic resources will be further evaluated in the EIR. Photo simulations of the proposed Project from key observation points will be provided to assist in the evaluation. The EIR will also analyze the possible impacts of reflection of the sun off the solar modules, and nighttime lighting of portions of the solar facility.

Agriculture and Forest Resources
The potential impact on prime and unique farmlands, forest lands, timberland, and lands zoned as such will be evaluated in the EIR, as will the potential impact of converting agricultural lands to non-agricultural uses.

Air Quality
The proposed Project site is located in the Mojave Desert Air Basin, and air emissions are regulated by the Mojave Desert Air Quality Management District (MDAQMD). The EIR will address consistency with regional and local air quality plans and evaluate and quantify the short-term and long-term sources of air pollutants generated by the Project, including mobile, stationary, and area source emissions.

Biological Resources
A biological resources assessment will be provided to evaluate the Project's effects on the area vegetation communities, wildlife habitats, wildlife movement, wetlands and waters, habitat conservation plans/protection ordinances, and sensitive and/or listed species.

Cultural Resources
Cultural resource effects will be analyzed in the EIR, including a query of the Northwest Information Center of the California Historical Resources Information System, analysis of sacred lands identified through consultation with the Native American Heritage Commission, and consultation with Native Americans and other interested parties (e.g., local historical societies). The evaluation will also address the potential impacts to historic resources and the occurrence of paleontological (fossil) resources.

Geology and Soils
The EIR will assess soil and geologic conditions of the Project area and address hazards related to seismic activity, including the potential for liquefaction, ground shaking, soil failure, soil stability and erosion potential.

Greenhouse Gas Emissions
The EIR will address the potential construction- and operation-related impacts relative to greenhouse gas emissions.

Hazards and Hazardous Materials
The EIR will evaluate the presence of hazards or hazardous conditions that could affect construction and operation of the Project, including the location of nearby or on-site hazardous waste sites included on State or federal databases, airport and airstrip hazard zones, emergency response routes, and wildfire hazards.

Hydrology and Water Quality
The EIR will include an analysis of existing drainage systems, and will evaluate potential impacts to water resources.

Land Use and Planning
The proposed Project may affect the use of the Project property. The EIR will evaluate potential environmental effects to land use that include compatibility with existing and proposed local zoning, and consistency with land use plans, policies or regulations of the applicable jurisdictions, which include the City of Blythe General Plan 2025, the Riverside County General Plan, and the BLM's Northern and Eastern Colorado Desert Coordinated Management Plan.

Mineral Resources
The Project's impact on mineral resource policies from local land use plans will be identified in the EIR. Project demand for mineral resources, including the need for sand and gravel, will be identified within the context of local supply.

Noise
The EIR will determine noise levels due to construction and operation of the proposed Project and will evaluate impacts for consistency with applicable laws, regulations, ordinances and guidelines.

Population and Housing
The EIR will address the short- and long-term population and housing impacts that would result from the construction workforce. These effects could include physical and service-related changes within area communities associated with demand for temporary housing.

Public Services
With the accommodation of the construction workforce, there may be a temporarily increased demand for public services, including community facilities and schools, and an increased need for police and fire protection services. The EIR will evaluate the potential for impacts on these public services.

Recreation
The temporary workforce may increase the demand for recreation facilities, including local and community parks in the Project area. The EIR will evaluate the changes to existing recreation services and parks that may result from Project implementation.

Traffic and Circulation
The EIR will include a traffic study that evaluates changes in circulation that could result from the proposed Project, focusing on effects during Project construction.

Utilities and Service Systems
Similar to the discussion under "Public Services," the proposed Project will be evaluated to determine the impact of any increases in the demand for public utilities, including demand for electricity and natural gas, increased demand for water, increased generation of wastewater requiring treatment, and increased generation of solid waste.

APPENDIX B: NEWSPAPER AD

AR060847

THIS PAGE INTENTIONALLY LEFT BLANK

A SCOPING SESSION has been scheduled before the **RIVERSIDE COUNTY PLANNING DIRECTOR** in order to bring together and hear the concerns of affected federal, state and local agencies, the proponent of the proposed project, and other interested persons; as well as inform the public of the nature and extent of the proposed project described below, and to provide an opportunity to identify the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in the Environmental Impact Report and help eliminate from detailed study issues found not to be important.

The Scoping Session is **not** a public hearing on the merit of the proposed project and **NO DECISION** on the project will be made. **Public testimony is limited to identifying issues regarding the project and potential environmental impacts.** The project proponent will not be required to provide an immediate response to any concerns raised. The project proponent will be requested to address any concerns expressed at the Scoping Session, through revisions to the proposed project and/or completion of a Final Environmental Impact Report, prior to the formal public hearing on the proposed project. Mailed notice of the public hearing will be provided to anyone requesting such notification.

ENVIRONMENTAL IMPACT REPORT NO.: **529**

PROJECT CASE NO(S). / TITLE: **CONDITIONAL USE PERMIT NO. 3670 / PUBLIC USE PERMIT NO. 913 / BLYTHE MESA I SOLAR PROJECT**

PROJECT LOCATION: East Riverside County – Palo Verde Area Plan, the Blythe Mesa I Solar Project is located approximately 5 miles west of central Blythe and 40 miles east of Desert Center; more specifically, the project is located north and south of Interstate 10, west of Neighbors Boulevard and Arrowhead Boulevard, south and east of the Blythe Airport. The site consists primarily of agricultural land located south and east of the community of Nicholls Warm Springs/Mesa Verde.

PROJECT DESCRIPTION: The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on a total of approximately 3,660 acres. The proposed project would consist of a solar array field utilizing single-axis solar PV trackers and panels with a combined maximum height of 8 feet. Supporting facilities on-site would include three electrical substations, two operation and maintenance buildings, inverters, transformers, and associated switchgear. Since most of the site has nearly level to gently sloping topography, no mass grading would be required and the natural drainage patterns of the site would not be significantly altered. The Project site would be secured 24 hours per day by onsite private security personnel or remote services with motion-detection cameras. An equestrian-wire, wildlife-friendly and drainage-compatible security fence that meets National Electric Safety Code would be placed around the perimeter of the site. The proposed lighting for the site would be consistent with County building code. A new 8.4 mile long, 230 kilovolt (kV) double-circuit generation-tie transmission line would connect the proposed project with the approved Colorado River Substation located west of the project site subject to Public Use Permit (3.6 miles of the gen-tie line are located within the project site, and 4.8 miles are located off-site between the project site and the Colorado River Substation). A majority of the project is within the County of Riverside jurisdiction. An approximate 330-acre portion of the 3,660-acre project site is located within the City of Blythe jurisdiction. A Development Agreement between the County of Riverside and the applicant will be established setting forth the rights and responsibilities of each party with respect to project development and operation.
APN's 821-110-004, 821-120-025, 821-120-026, 821-120-027, etc.

TIME OF SCOPING SESSION:	**6:00 p.m.** or as soon as possible thereafter.
DATE OF SCOPING SESSION:	**December 12, 2011**
PLACE OF SCOPING SESSION:	**Blythe City Council Chambers** **235 N. Broadway** **Blythe, CA 92225**

Please send all written correspondence to:
RIVERSIDE COUNTY PLANNING DEPARTMENT

AR060850

THIS PAGE INTENTIONALLY LEFT BLANK

BLYTHE MESA SOLAR PROJECT
Scoping Meeting

December 12, 2011

Applicant: RENEWABLE RESOURCES GROUP

RIVERSIDE COUNTY
PLANNING DEPARTMENT

Introductions

- CEQA Lead Agency — RIVERSIDE COUNTY PLANNING DEPARTMENT
- Responsible Agency — City of Blythe
- Applicant — RENEWABLE RESOURCES GROUP
- Environmental Consultant — POWER ENGINEERS

Purpose of Meeting

- Provide information about the Blythe Mesa Solar Project
- Communicate the California Environmental Quality Act (CEQA) review process
- Seek comments and input on the scope of the Environmental Impact Report

Riverside County's Role

- Conditional Use Permit approval
- Public Use Permit approval
- Development Agreement
- Lead Agency for the California Environmental Quality Act (CEQA)

California Environmental Quality Act (CEQA)

- Requires the preparation, review, and certification of an environmental review document prior to an action on any non-exempt discretionary projects proposed by public agency in State of California.

Environmental Impact Report (EIR)

- An informational document that provides public agencies and the public with detailed information about the proposed project's significant affects on the environment. It also lists ways to avoid or minimize impacts, and identifies alternatives to the project.

EIR Process

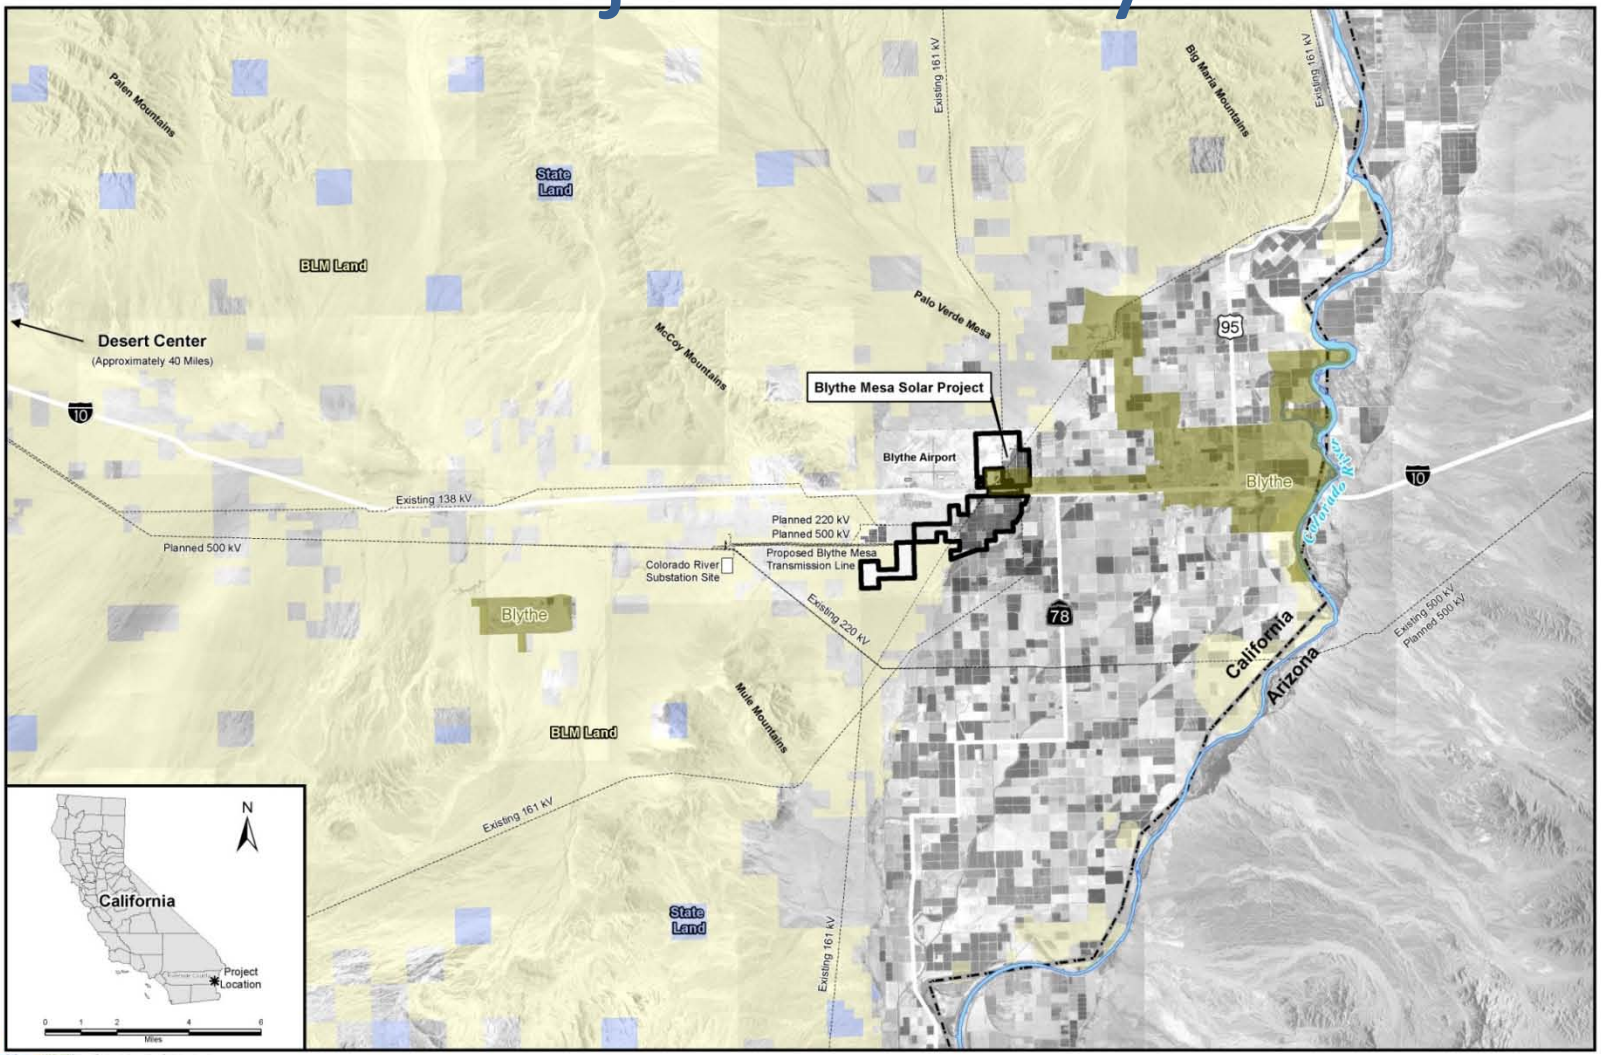
- Distribute Notice of Preparation (NOP)
- Prepare Draft EIR
  - Identify and analyze significant impacts
  - Recommend measures to avoid/reduce impacts
  - Evaluate a reasonable range of alternatives
- Circulate Draft EIR for public review
- Respond to comments and prepare Final EIR
- Notice of Determination

EIR Resource Topics

- Aesthetics/Visual Resources
- Agricultural Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use
- Noise
- Public Services and Utilities
- Socioeconomics
- Traffic and Circulation

Proposed Project

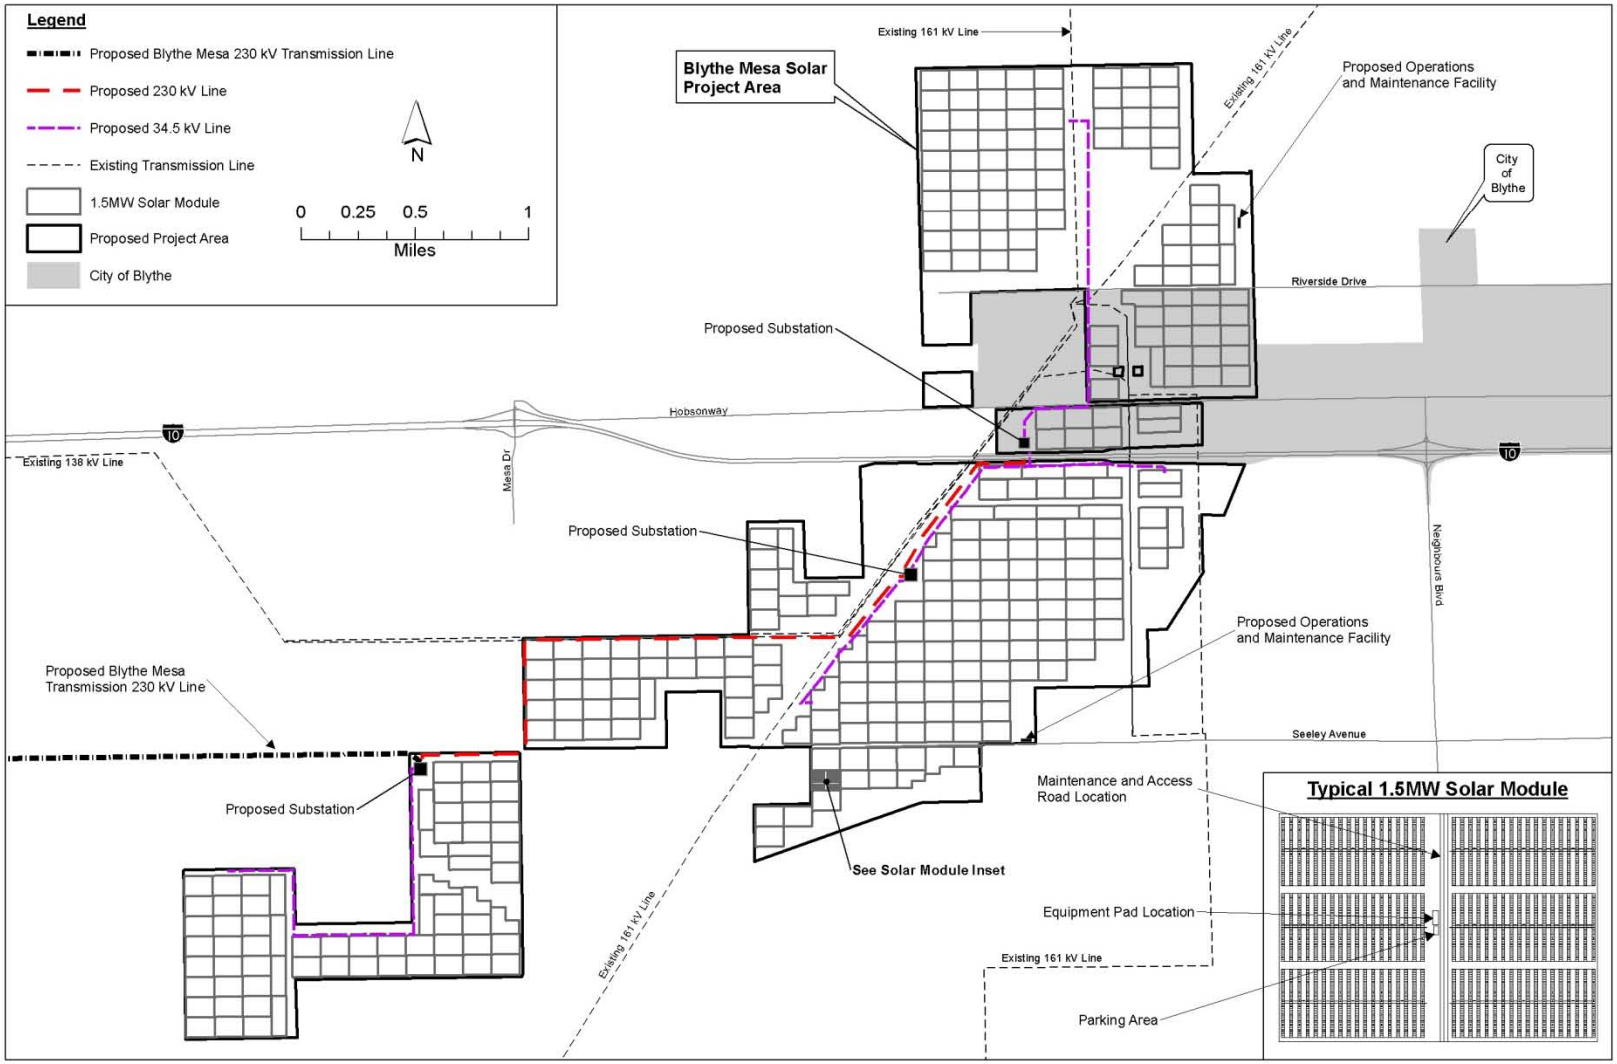
- Construction and operation of a 485 megawatt (MW) solar photovoltaic electrical generating facility that would occupy approximately 3,660 acres.



Project Objectives

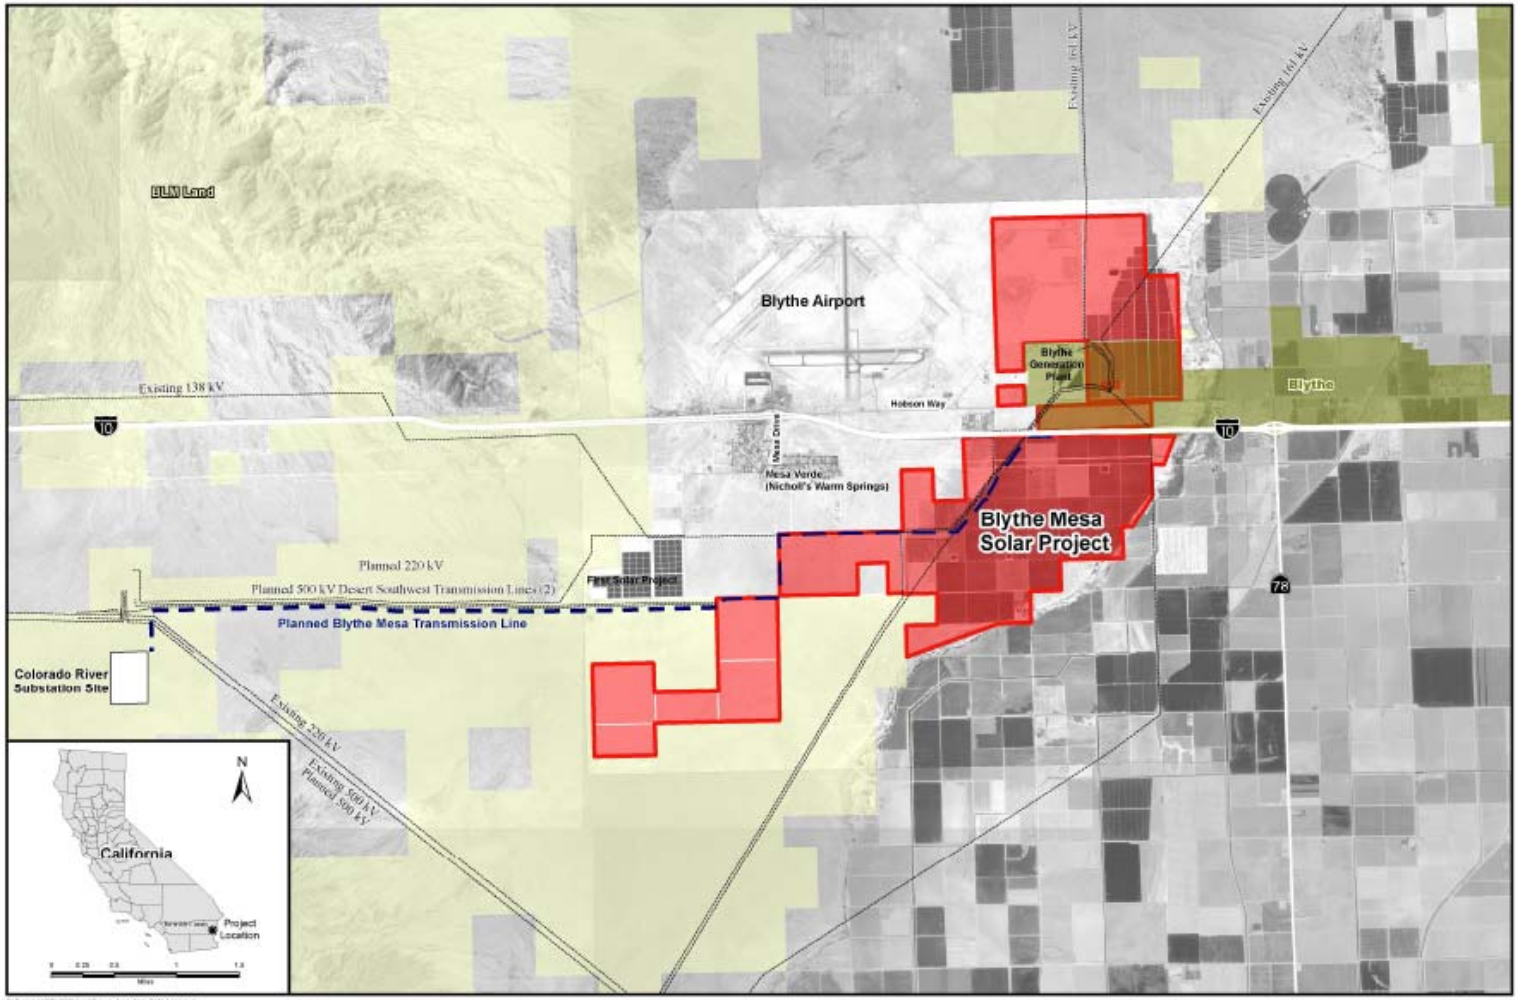
- Assist with meeting California's Renewable Energy Standards and Goals
- Assist with greenhouse gas reduction
- Locate project facilities near electrical transmission facilities
- Site project in an area with excellent solar energy resources to maximize energy productivity from PV panels
- Site on disturbed land with compatible topography that minimizes environmental impacts
- Use a proven and available solar PV technology

Key Project Components



- Solar array field
  - Interior collection power lines (34.5 kV)
  - Three substations (300 feet by 300 feet)
  - Two operation & maintenance buildings (approximately 3,500 square feet each)
  - Two primary access roads (Seeley Avenue & Riverside Drive)
- 8.4 mile 230 kV double-circuit transmission line

Project Vicinity



AR060862

Site Plan

AR060863

Transmission Component

AR060864

Opportunities for Public Involvement

Notice of Preparation (NOP) • Issue NOP for 30-day public review • Scoping Meeting	 November – December 2011 December 12, 2011
Draft EIR Preparation • Compile Draft EIR • Draft EIR Public Review and Comment	 Winter 2011 to Summer 2012 Summer 2012
Final EIR Preparation • Public Hearing – Board of Supervisors	 Late-Summer 2012

NOP Public Review

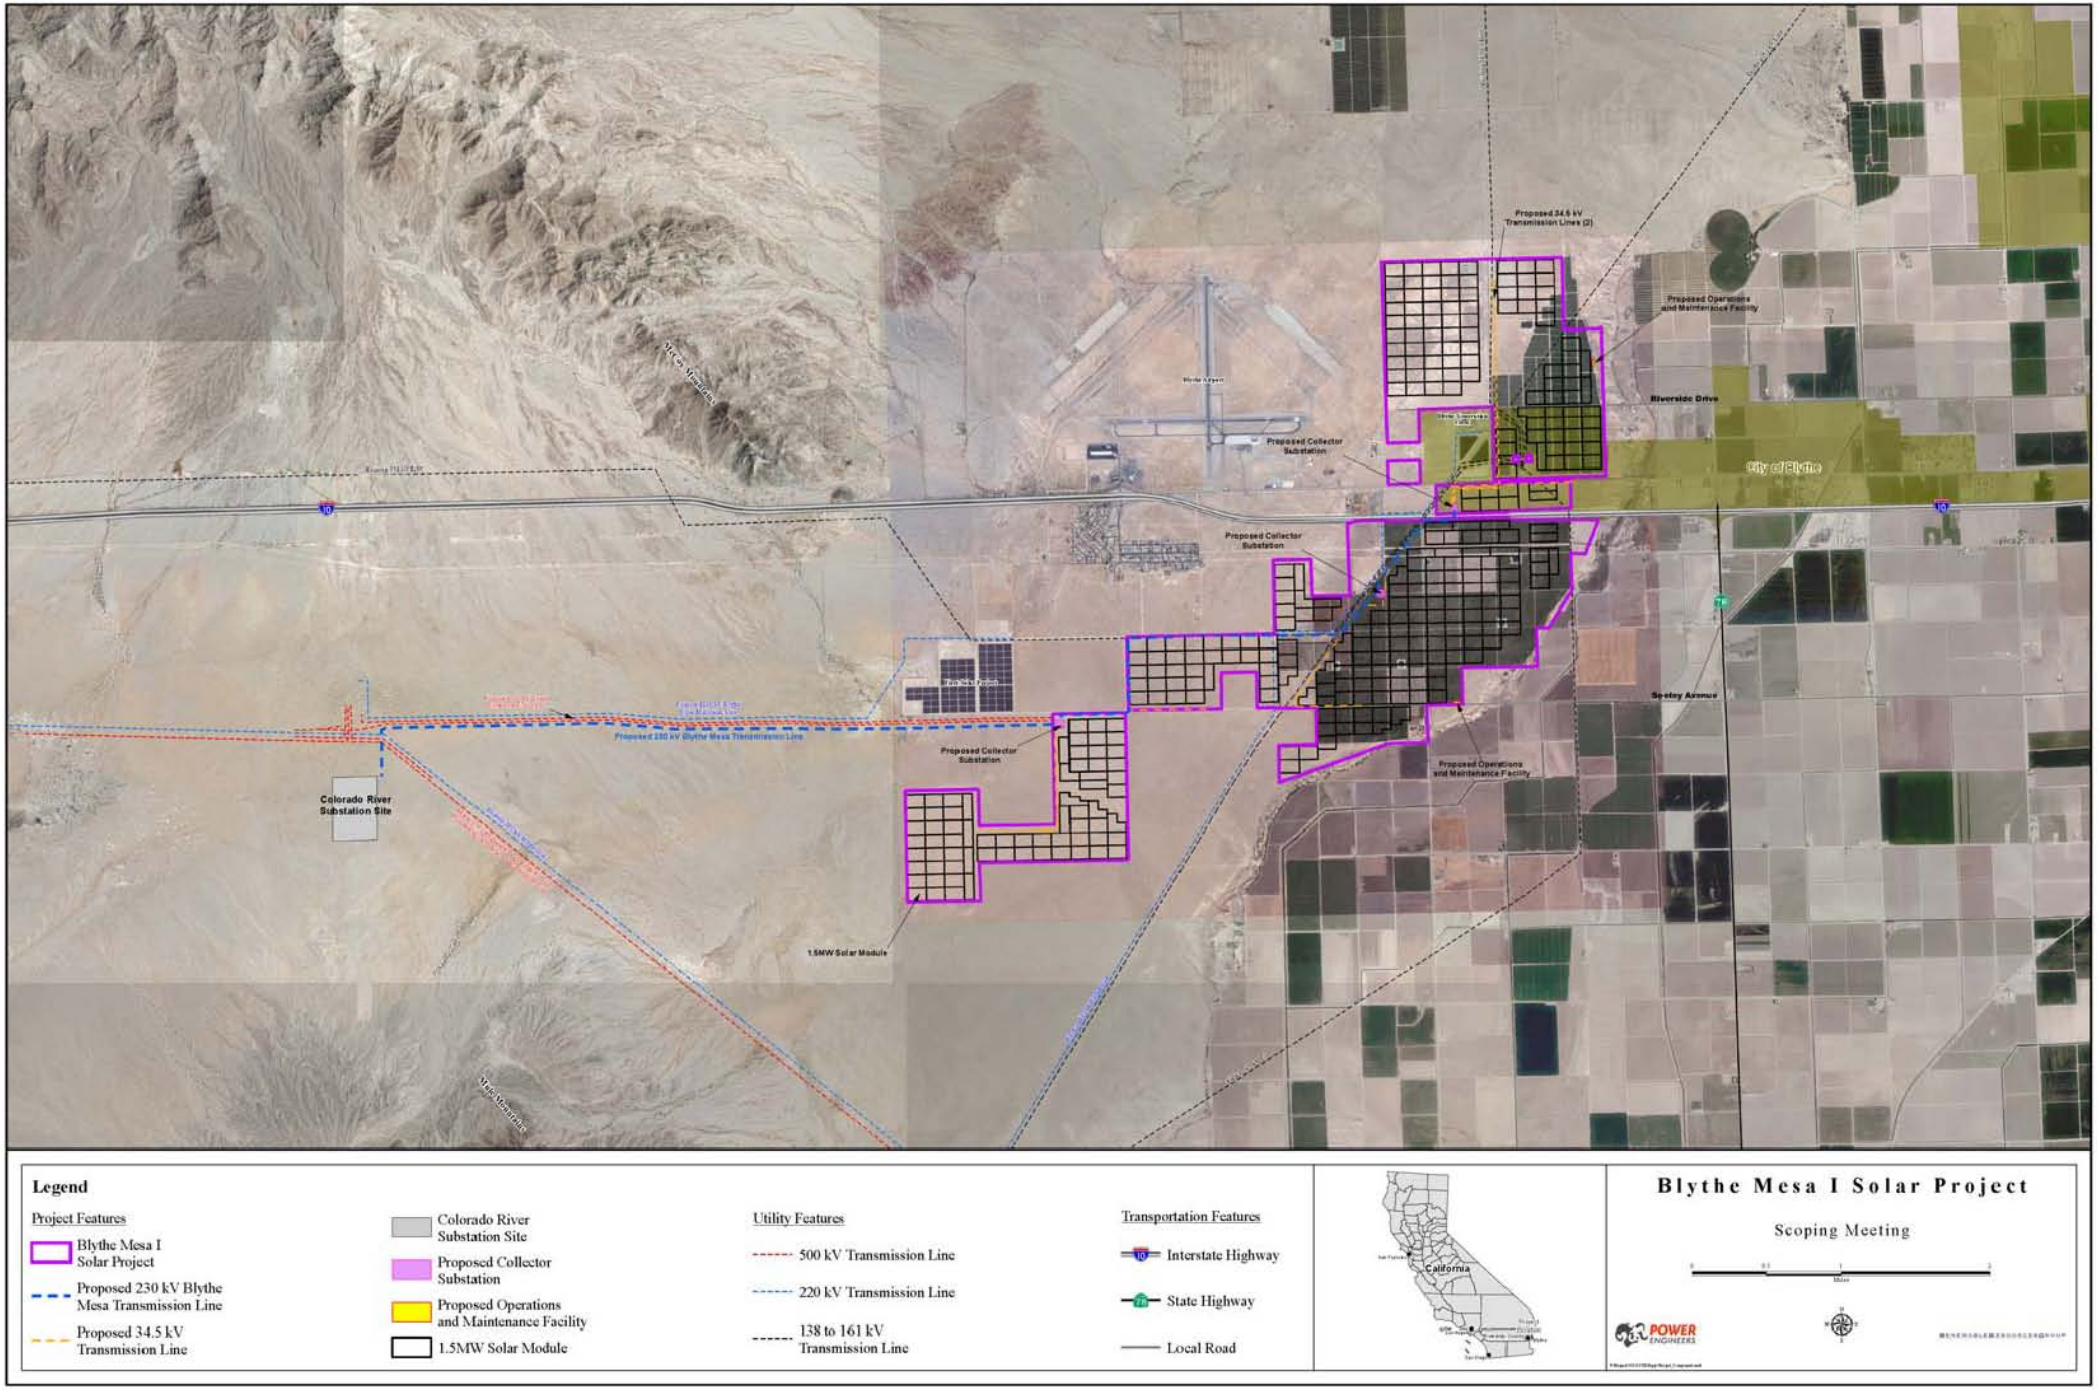
Comments concerning the scope of the environmental analysis are requested by **December 22, 2011** so that technical studies reflect that input.

- Submit a comment form during the public scoping meeting
- Email jolivas@rctlma.org
- Phone (951) 955-1195
- Write to:

  Jay Olivas, Project Planner
  Riverside County Planning Department
  4080 Lemon Street, 12th Floor
  P.O. Box 1409
  Riverside, CA 92502-1409

  For additional project information please visit the County of Riverside's web page at http://www.tlma.co.riverside.ca.us/planning/

Oral Scoping Comments



- Comment Cards

- Guidelines
  - State (and spell) your name clearly
  - Only one person shall speak at a time
  - Support everyone's participation
  - Respect others' opinions

Proposed Project

Construction and operation of a 485 megawatt (MW) solar photovoltaic electrical generating facility that would occupy approximately 3,660 acres.

- Solar array field
  - Interior collection power lines (34.5 kV)
  - Three substations (300 feet by 300 feet)
  - Two operation & maintenance buildings (approximately 3,500 square feet each)
  - Two primary access roads (Seeley Avenue & Riverside Drive)
- 8.4 mile 230 kV double-circuit transmission line

RIVERSIDE COUNTY
PLANNING DEPARTMENT

Comment Form

The County of Riverside thanks you for your interest in the Blythe Mesa I Solar Project. Scoping meetings are being conducted to share information regarding the project and decision-making process, and listen to the public views on the range of issues to be considered during the preparation of a Draft Environmental Impact Report. Please take a moment to answer the questions below and return this sheet to the comment table or mail to the address on the back of this form by **December 22, 2011.**

NAME: _____ DATE: _____

ADDRESS: _____

CITY/STATE/ZIP: _____

EMAIL (optional): _____

Please describe any issues that should be considered during the resource studies and in environmental resource document preparation.

PUBLIC SCOPING MEETING FOR THE CONDITIONAL USE PERMIT NO. 3670/ PUBLIC USE PERMIT NO. 913/ BLYTHE MESA | SOLAR PROJECT

REPORTER'S TRANSCRIPT OF PROCEEDINGS

Taken on Monday, December 12, 2011

At 235 North Broadway
Blythe, California

At 6:00 p.m.

REPORTED BY: JULIETTE L. VIDAURRI CCR, RPR
AZ CR #50359/CA CSR #11081/NV CCR #748

APPEARANCES:

Ken Baez, Principal Planner for the Riverside County Planning Department

Thomas C. Ryan, Senior Project Manager, for Power Engineers

Rupal Patel for Renewable Resources Group, Inc.

MR. BAEZ: Well, good evening, everybody. How you doing? Glad you all can make it, and welcome to our Riverside County Director of Hearing Blythe Mesa Solar Project Scoping Meeting.

My name is Ken Baez, and I'm the Riverside County Planner assigned to the project, and with us here also we have the City of Blythe and some representatives from their planning department, as well as the applicant, and their engineer that will go over some of the details on the project.

The purpose of this meeting is pretty much to inform you and get feedback from you about the project, the solar project that's, um, by the name of Blythe Solar Management -- Blythe Solar Mesa. Sorry about that.

It is a project that entails 485 megawatts of power production and transmission line located on approximately 3,660 acres throughout unincorporated areas of Riverside County and also the City of Blythe. A small portion of that, um, located primarily on the southwesterly portion of the city.

And also we want to kind of go over the details of the California Environmental Quality Act, and the process in which allows the public to provide comments on the resources that we'll be analyzing.

We also will be requiring that the applicant get a

Conditional Use Permit approval as well as a Public Use Permit approval for the project.

Now, the two different permits are -- one is a Conditional Use Permit is for the generation facility where they will be generating and setting out the solar photovoltaic panels, and the transmission component is the transmission of power into the grid, which is the Public Use Component, and then we'll also be seeking to negotiate a development agreement as well as act on the Environmental Impact Report.

Now, the California Environmental -- Environmental Quality Act requires the preparation, review, and certification of an environmental review document prior to any action or any non-exempt discretionary projects proposed by the public agency of California, which essentially means that we're going to be analyzing this project for its environmental impact before we act on it, so... And the Environmental Impact Report essentially is a document that we will use to analyze those impacts.

MR. HOWARD: Excuse me. Can we ask questions or is it better just to save those?

MR. BAEZ: Yeah, save your questions until the end. And pretty much if you have any comments that you would like to provide to us, we'll have an opportunity at the end of the discussion to have you give us a comment

card, which we have available here. If you would like to write down your questions or comments and concerns, that way we can have those addressed in the document.

It's a question-and-answer session, please note that, and we will do the best we can with the experts that we have here today, so...

And as I said, the EIR process is where we have distributed a Notice of Preparation, which is available here in a handout, and it basically identifies the resources that we're analyzing for the impact from the project.

And we primarily look at identifying and analyzing significant impacts. Those are things that need to be mitigated. Recommend measures to avoid or reduce those impacts, i.e., the mitigation measures, and evaluate a reasonable range of alternatives, so we're looking at this project as well as other alternatives.

And we will circulate the Draft Environmental Impact Report for review, and we'll respond to the comments and prepare those in the final EIR, in which case after that we'll be issuing a Notice of Determination, which is the findings that we have for the Environmental Impact Report of the public agency.

And these are some of the topics that we will be covering in the Environmental Impact Report; and if you are seeking to have any comments that you may have from the

public, that we may address them further, any concerns that you might have about these resources.

With that said, I'll hand it over to Tom from the engineering firm to go over the details of the project.

MR. RYAN: Thank you, Ken.

My name is Tom Ryan with Power Engineers, and Power is assisting the County and the applicant with preparation of the Environmental Impact Report.

As Ken mentioned, this is a proposed of 485 megawatt solar photovoltaic project. It's total -- the total acreage is 3,660. That includes the project site itself plus another component, which is a transmission -- a short transmission line from the project site to a substation.

I'll show you a little bit more about the project in a moment, but I wanted to talk to you a little bit about project objectives, and project objectives are important from the CEQA standpoint because they basically answer why the project is being proposed.

So if we can get a good foundation for why a project is being proposed, it helps in quantification of the impacts and mitigation measures, it helps us justify alternatives, and it helps us with the findings that must be made later in the process when it comes to project consideration or approval.

So the project is being designed to obtain a number of objectives, and one is to assist with meeting the California Renewable Energy Standards and Goals.

The California Renewable Portfolio Standards that have been adopted require that 33 percent of the electricity used in the state be supplied from renewable resources by the year 2020, and there -- there was a previous deadline for that of 2010. There's an increasing percentage as we go forward into 2050, but the next step of that is the 33 percent by 2020.

And I know much progress has been made for renewable energy. It's projects like this that will help achieve that next level of the Renewable Portfolio Standard, so this projects contributes to that objective.

Next is assist with greenhouse gas reduction. We have in California the California Global Warming Solutions Act of 2006. There have been some amendments in the federal orders to that which establish the objective of reducing greenhouse gas emissions to 1990 levels by the year 2020. That means that we need to reduce greenhouse gas generation by about 25 percent to achieve that -- that 1990 level baseline.

So projects like this would provide electrical energy without using fossil fuels to help us meet the Global Warming Solutions Act objectives.

Locate the project near electrical transmission facilities. Um, I think a major impediment to meeting the Renewable Portfolio Standards is the fact that many of the solar projects and wind projects which are renewable are located in remote areas that aren't necessarily certified major transmission.

This project happens to be located close to the transmission. We are within four and a half miles of the major substation, and can -- this project will tie into to serve the regional grid.

Another objective is, of course, to take advantage of excellent solar resources, and the Blythe area, as you may know, is blessed with great solar resources. It's not just us saying that. It's Bureau of Land Management and Department of Energy have characterized the resources in the Riverside East study area as excellent potential for solar.

Um, another objective is the site the project is on disturbed lands with compatible topography. This project is by no means in an area of pristine desert environment. We've got the past -- current and previous agricultural use on the property. It's near the Blythe Airport, um, where a -- bisected by a major interstate highway. We've got regional transmission lines all surrounding the project site, so this is a disturbed property.

And then the final objective is use a proven and

available solar PV technology for the project. The solar panels and tracker systems which are proposed by Sun Power are proven photovoltaic systems. There's 250 megawatts of installed capacity and more projects in the works, so this is a good, reliable solar technology to use here.

And another thing about this particular technology is that it actually reduces the amount of land that is necessary for solar generation by the tracking mechanism taking full advantage of the solar radiation as well as minimizing shading over adjacent panels by the individual panels.

So those are some of the project objectives, and we will go on to key project components. There's two primary components. The Solar Array Field, which is -- has a number of self components to it. There's a few substations. There's a few O&M facilities. We have a system of both underground and aboveground collection -- electric collection lines. We have two major access roads on Seeley Avenue and Riverside Drive, which I will point out in a moment, and then the second primary component is the 230 kV transmission line from the project site to the Colorado River Substation.

This is just to give you an orientation of where the project is. We've got the project site outlined in black there, City of Blythe in the green shading, got the

Blythe Airport, and the California/Arizona border over here, Interstate 10 bisecting the project site, and the transmission line from the edge of the project to the Colorado River Substation, which is right there.

Some more detail site plan. These little squares on here are power blocks or actually what we call solar modules. There's a blow-up of solar module right here, which contains the rows of solar panels. There's some equipment that is necessary to convert the power -- collect the power, convert it to AC/DC, and then transmit it on to -- throughout the system on the project site.

Each one of these little squares is about 1.5 megawatts, and there's -- they're arranged on the project site and connected via a system of 34 and a half kV lines, and those lines show up as purple. There's one there, which connects down into the -- a project substation. There's also 34 and a half kV overhead lines here for this substation, and then on this parcel connecting to the third substation here.

The City of Blythe boundary here is about 330 acres on the project within the City of Blythe city limits. Major access is Riverside Drive here accessing this O&M facility right there, and then Seeley Avenue down here to access a second O&M building in this location.

The substations on the project site are connected

via 230 kV overhead transmission line, which follows an alignment from this first substation, across the freeway, down adjacent to some existing transmission lines, cutting across and reaching down here, and then exiting the project site in a westerly direction to the Colorado River Substation.

This is just another view of the project site. Um, I wanted to talk just for a minute about this transmission facility here. From the project site where the 230 kV line goes west to the Colorado River Substation, once you get about a mile in here just past the first solar project, which is right there, the project enters a combination of federal and private land.

So to permit and approve this -- this portion of the alignment, roughly this portion, will require the Bureau of Land Management to -- to give a right-of-way grant. And to issue that right-of-way grant they are likely to require some kind of environmental documentation, and we are not sure exactly what form of documentation, but that's a separate action, and, um, we will be working with the Bureau of Land Management to determine what their preference is for that, but wanted to -- to state that the CEQA requires us to look at the whole of an action, so the EIR will cover the entire project including the solar panel portion on private land and the transmission portion on federal land, and

hopefully then the federal government when they get around to doing their environmental documentation will draw from the EIR or maybe perhaps use the EIR for that purpose. So that's the proposed project.

Ken, would you like to close us.

MR. BAEZ: Throughout the CEQA process there are a number of opportunities for the public to comment and review the documentation; and as you see here today, we are at the scoping meeting here, and it will essentially be closing on December 22nd; so if you would like to give comment and you're not in a position to do it today, you can do it by the 22nd.

I have contact information that's at the end of the slide that you are more than welcome to have. I also have business cards that we will be giving out, as well as also during the Draft EIR preparation that is expected to come out in the summer of 2012 there will also be a public review and comment.

We will have a notice that will be circulated out in the newspaper and also identify that the opportunity to review and comment is open as well as the final EIR when we post it for the decision-making body, the Board of Supervisors of Riverside, to certify the document as well as approve the Conditional Use Permit and the Public Use Permit.

So with that, that concludes my presentation, and here's the contact information that we would like to hand out to you and give that to anyone who's interested.

So if you have any comments or questions, I urge you to fill out a card; and also if you stand up and speak, please clearly state your name, and I'll open the floor to any questions or comments.

Any questions or comments?

MR. HOWARD: My name is Ray Howard --

THE COURT REPORTER: I'm sorry. I didn't hear your last name.

MR. HOWARD: Howard, H-o-w-a-r-d. And my question is regarding the three substations. Just at the map I couldn't really tell where those are at. Are those already being used or is that something you are going to be building?

MR. RYAN: They will be built. They will be constructed.

MR. HOWARD: And can you again go back to that map and give me a little more information as to where they are?

MR. RYAN: Right. Okay. So here's Interstate 10 coming across here.

MR. HOWARD: Okay.

MR. RYAN: This is the Blythe Energy Center

right there.

MR. HOWARD: That's the current --

MR. RYAN: Yeah, the existing energy center. The airport is over here. So one of the substations is right there, and the other one is right here. This is pretty much an orchard right now.

MR. HOWARD: Okay. And both of those are on the south side of the freeway?

MR. RYAN: One's on the north side. This one's on the south side, and there's a third one down here.

MS. HOWARD: So is the top -- the first one at the top -- I'm sorry. I'm Shannon Howard. I'm his wife. Is the one at the top the one that's existing there now, that substation?

MR. RYAN: No. This will be new.

MS. HOWARD: So this is totally new?

MR. RYAN: Yeah. It's not there yet.

MS. HOWARD: So all of the stuff that's there is not part of this at all or won't be part of this?

MR. BAEZ: That's correct.

MR. RYAN: All of these facilities will be new -- newly constructed facilities.

MR. ELLIS: My name is Ron Ellis. I have a question of the group. Is Riverside and Blythe talking about doing this? I don't see a contractor or who's going

to try to put this together?

MR. BAEZ: The applicant is Renewable Recourses Group, and we have -- that's the applicant engineering.

MR. ELLIS: I didn't see this written down here. Maybe I missed it.

MR. BAEZ: It's in the beginning on the opening slide. It had an introduction that introduced them as the --

MR. ELLIS: Okay. I didn't recognize that as the name.

MR. RYAN: Yeah, this is not -- not -- it's in the permitting stage right now. We are going through the environmental process, and it will require a formal project approval, and then there will be some permits issued, and then construction would go.

MR. ELLIS: I've seen these processes go through, and sometimes it takes years to get this taken care of. Now, this PV, these processes, are they a little bit faster?

MR. BAEZ: Are they a little bit faster? It's kind of a new territory for Riverside County, and we're doing the best we can to permit these things when they come through, but the review process is the review process. We have to evaluate the environmental impact, and we're

dependent upon the applicant to provide the documentation that's needed, so there are studies that are required, and sometimes they are prepared on time, and sometimes they have to wait a year for specific focus surveys to be done, particularly in biology. Sometimes the season isn't right for those to be done, so sometimes there's a wait that we have to endure for these types of projects.

Any other questions?

MR. HOWARD: You mentioned that Riverside Avenue would be one of the access roads, and at this time Riverside Avenue doesn't go all the way up on the Mesa there. Will that be extended?

MR. BAEZ: It would be required to have improvements done when --

MR. HOWARD: Paved?

MR. BAEZ: It will be paved more than likely. It's up to our transportation department to establish the requirement for that, and that would be subject to a condition of approval on the approved projects such as the Conditional Use Permit as well as the Public Use Permit.

MR. HOWARD: I know it's part of the environmental impact in one of the reports in terms of the traffic. Um, what kind of traffic are you expecting to be involved in that area where the solar panels are at?

MR. BAEZ: That would primarily be -- the

higher point would be likely during the construction phase. That's where it would probably be the highest impact as well as some of the maintenance. That's where it would be evaluated. It's based on information that they provide to us on truck traffic trips, on daily truck traffic.

MR. HOWARD: Okay. At the present time there's some alfalfa fields, which I believe is part of the land that's going to be developed at some point in time.

Do you have any kind of a time frame? Because I've heard that those alfalfa fields would be staying for some time.

MR. BAEZ: That could potentially be there until they are ready to construct. That might be something part of what the land requisition between the applicant and the land owner, so it could be something that's worked out between them, but until that entitlement is actually -- a permit is being pulled for that, that can very well likely be until that time.

MR. HOWARD: Well, I am -- let me also state that I live up there. I have a house that's by those alfalfa fields, and there's a dirt road that kind of goes in front of our house, and I'm wondering if that is going to be considered one of the access roads, and if that's where part of this traffic is going to be going back and forth down.

MR. BAEZ: I can't say for any certainty

where that road is, what they're analyzing, what they are providing as far as what their access points are. That's our transportation department's. They have to look into our general plan and see what those roads require for any improvements when they go forward with their project.

MR. HOWARD: Okay.

MR. BAEZ: It wouldn't be done until after the approval process would be done.

MR. HOWARD: And I know there are lots of factors that will determine exactly when this is all under construction. Can you give me any kind of rough date of when to expect?

MR. BAEZ: I'd have to rely on the applicant quite honestly for that.

MS. PATEL: We are projecting probably January 2013.

MR. HOWARD: At least that's something to be aware of.

MS. PATEL: Uh-huh. Absolutely. And it will be completely spelled out and analyzed in the Environmental Impact Report.

MR. HOWARD: Okay. Now, can the general public get a copy of that Environmental Impact?

MR. BAEZ: It will be available.

MR. HOWARD: Do you have to sign up for

something to get that?

MS. PATEL: And you'll be able to comment. If you're part of this NOP scoping process -- I'm sorry. I'm probably speaking out of turn -- but if you're part of the NOP scoping process, you'll be included in the distribution of all notices and reports associated with this project.

MR. BAEZ: Okay. Because you signed in; right --

MR. HOWARD: Yes.

MR. BAEZ: -- with your address and contact information. You will be notified.

MR. HOWARD: Okay. Thank you.

MR. RYAN: Did you receive a letter by mail for this?

MR. HOWARD: Yes. And we appreciate that.

MR. RYAN: You will be notified.

MR. ELLIS: A project of this size, how long do you believe the construction project itself will take?

MR. RYAN: It's an estimate of about three years to construct. Um, the peak construction period, you know, there could be anywhere between two to 300 workers, 300 to 400 -- 200 to 400 workers at one time for the peak 24-month period, but a three-year total process.

So if it's January 2013, then it's three years

before it's completed.

MR. BAEZ: Anybody else?

(No response.)

MR. BAEZ: Okay. And if you happen to have any comments, like I said, or questions, we would be happy to answer those. Just be sure to get those in before the 22nd of December.

With that, I'll close this, and I'll have my contact information here so if you would like to jot that down.

(The meeting concluded at 6:25 p.m.)

CERTIFICATE OF REPORTER

State of Arizona)
)
County of Mohave)

I, Juliette L. Vidaurri, CCR, RPR, do hereby certify that I took down in shorthand (Stenotype) all of the proceedings had in the above-entitled matter at the time and place indicated, and that thereafter said shorthand notes were transcribed into typewriting at and under my direction and supervision, and the foregoing transcript constitutes a full, true, and accurate record of the proceedings had.

In witness whereof, I have hereunto affixed my hand the 28th day of December, 2011.

_____

APPENDIX D: SCOPING MEETING NOTICE

AR060893

NOTICE OF SCOPING SESSION

A SCOPING SESSION has been scheduled before the **RIVERSIDE COUNTY PLANNING DIRECTOR** in order to bring together and hear the concerns of affected federal, state and local agencies, the proponent of the proposed project, and other interested persons; as well as inform the public of the nature and extent of the proposed project described below, and to provide an opportunity to identify the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in the Environmental Impact Report and help eliminate from detailed study issues found not to be important.

The Scoping Session is **not** a public hearing on the merit of the proposed project and **NO DECISION** on the project will be made. **Public testimony is limited to identifying issues regarding the project and potential environmental impacts.** The project proponent will not be required to provide an immediate response to any concerns raised. The project proponent will be requested to address any concerns expressed at the Scoping Session, through revisions to the proposed project and/or completion of a Final Environmental Impact Report, prior to the formal public hearing on the proposed project. Mailed notice of the public hearing will be provided to anyone requesting such notification.

ENVIRONMENTAL IMPACT REPORT NO.: **529**

PROJECT CASE NO(S). / TITLE: **CONDITIONAL USE PERMIT NO. 3670 / PUBLIC USE PERMIT NO. 913 / BLYTHE MESA I SOLAR PROJECT**

PROJECT LOCATION: East Riverside County – Palo Verde Area Plan, the Blythe Mesa I Solar Project is located approximately 5 miles west of central Blythe and 40 miles east of Desert Center; more specifically, the project is located north and south of Interstate 10, west of Neighbors Boulevard and Arrowhead Boulevard, south and east of the Blythe Airport. The site consists primarily of agricultural land located south and east of the community of Nicholls Warm Springs/Mesa Verde.

PROJECT DESCRIPTION: The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on a total of approximately 3,660 acres. The proposed project would consist of a solar array field utilizing single-axis solar PV trackers and panels with a combined maximum height of 8 feet. Supporting facilities on-site would include three electrical substations, two operation and maintenance buildings, inverters, transformers, and associated switchgear. Since most of the site has nearly level to gently sloping topography, no mass grading would be required and the natural drainage patterns of the site would not be significantly altered. The Project site would be secured 24 hours per day by onsite private security personnel or remote services with motion-detection cameras. An equestrian-wire, wildlife-friendly and drainage-compatible security fence that meets National Electric Safety Code would be placed around the perimeter of the site. The proposed lighting for the site would be consistent with County building code. A new 8.4 mile long, 230 kilovolt (kV) double-circuit generation-tie transmission line would connect the proposed project with the approved Colorado River Substation located west of the project site subject to Public Use Permit (3.6 miles of the gen-tie line are located within the project site, and 4.8 miles are located off-site between the project site and the Colorado River Substation). A majority of the project is within the County of Riverside jurisdiction. An approximate 330-acre portion of the 3,660-acre project site is located within the City of Blythe jurisdiction. A Development Agreement between the County of Riverside and the applicant will be established setting forth the rights and responsibilities of each party with respect to project development and operation. APN's 821-110-004, 821-120-025, 821-120-026, 821-120-027, etc.

TIME OF SCOPING SESSION:	**6:00 p.m.** or as soon as possible thereafter.
DATE OF SCOPING SESSION:	**December 12, 2011**
PLACE OF SCOPING SESSION:	**Blythe City Council Chambers** **235 N. Broadway** **Blythe, CA 92225**

Please send all written correspondence to:
RIVERSIDE COUNTY PLANNING DEPARTMENT
Attn: Jay Olivas
P.O. Box 1409, Riverside, CA 92502-1409

For further information regarding this project, please contact Project Planner, Jay Olivas at 951-955-1195, or e-mail jolivas@rctlma.org.

PROPERTY OWNERS CERTIFICATION FORM

I, VINNIE NGUYEN, certify that on 11/16/2011,

The attached property owners list was prepared by Riverside County GIS,

APN (s) or case numbers CUP03670 For

Company or Individual's Name Planning Department,

Distance buffered 2400'.

Pursuant to application requirements furnished by the Riverside County Planning Department, Said list is a complete and true compilation of the owners of the subject property and all other property owners within 600 feet of the property involved, or if that area yields less than 25 different owners, all property owners within a notification area expanded to yield a minimum of 25 different owners, to a maximum notification area of 2,400 feet from the project boundaries, based upon the latest equalized assessment rolls. If the project is a subdivision with identified off-site access/improvements, said list includes a complete and true compilation of the names and mailing addresses of the owners of all property that is adjacent to the proposed off-site improvement/alignment.

I further certify that the information filed is true and correct to the best of my knowledge. I understand that incorrect or incomplete information may be grounds for rejection or denial of the application.

Highland, CA 92346

Subject: Proposed Blythe Mesa Solar Farm in Riverside County, California

Dear Ms. Brierty:

POWER Engineers, Inc. (POWER) is sending you this letter on behalf of Renewable Resources Group (RRG) to inform you of the proposed Blythe Mesa Solar Farm in eastern Riverside County, California. We also request information you are willing to share regarding Native American cultural resources in the project area as well as any comments or concerns you may have about the project in general. The information you provide will be considered during project planning and design.

RRG is planning to construct and operate a 485 megawatt solar photovoltaic energy generating facility in the Palo Verde Mesa region of Riverside County. The proposed solar farm will help California meet its Renewable Portfolio Standard (RPS) mandate, which requires each of California's investor-owned utilities to supply 20 percent of its total electricity through renewable energy generation by the year 2020.

The proposed project would be located approximately 5 miles west of the city of Blythe. The project site is comprised of disturbed parcels that were previously farmed or fallow totaling approximately 3,828 acres, located to North and South interstate 10. The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5' U.S. Geological Survey (USGS) Topographic Quadrangles (see attached Project Area Map). The project is located on:

- Sections 1-14 of Township 7 South, Range 21East
- Sections 3, 4, 5, 6, 8, 9 of Township 7 South, Range 22 East
- Sections 27, 28, 29, 32, 33, 34 of Township 6 South, Range 22 East of the San Bernardino Base Meridian.

POWER is managing and conducting the overall permitting program for the proposed Blythe Mesa Solar Farm for RRG. An Environmental Impact Report (EIR) is currently being prepared for Riverside County.

We look forward to hearing from you, Ms. Brierty. If you have any questions or desire additional information, please do not hesitate to contact either of us at your convenience: Johanna Marty at (714) 507-2739 (johanna.marty@powereng.com) or Gini Austerman at (714) 507-2761 (gini.austerman@powereng.com).

Sincerely,

Johanna Marty,
Cultural Resource Specialist

AGUA CALIENTE BAND OF CAHUILLA INDIANS

TRIBAL HISTORIC PRESERVATION

December 19, 2011

Jay Olivas
Project Planner
38686 El Cerrito Road
Palm Desert, CA 92211

Re: Preparation of Draft Environmental Impact Report for Blythe Mesa Solar Project, Riverside County CA.

Dear Mr. Olivas:

The Agua Caliente Band of Cahuilla, ACBCI Indians appreciates your efforts to include the Tribal Historic Preservation Office (THPO) in the Blythe Mesa Solar Project. The proposed project is located in Riverside County in Blythe near the McCoy Mountains. The project is not located on lands managed by the Agua Caliente Band of Cahuilla Indians, but the project is within the ACBCI's Traditional Trade Network Area. The THPO comments and recommends:

1. A 100% cultural resources inventory of the project area by a qualified archaeologist prior to any development activities in this area. ***Please forward copies of any cultural resource documentation (report and site records) generated in connection with these efforts to the Tribal Historic Preservation Office for review and comment.***

2. The presence of an approved Native American Cultural Resource Monitor(s) during any ground disturbing activities (including archaeological testing). Should buried cultural deposits be encountered, the Monitor may request that destructive construction halt and the Monitor shall notify a Qualified Archaeologist (Secretary of the Interior's Standards and Guidelines) to investigate and, if necessary, prepare a mitigation plan for submission to the State Historic Preservation Officer and the Agua Caliente Tribal Historic Preservation Officer.

3. Please forward copies of any cultural resource documentation (report and site records) generated in connection with these efforts to the Tribal Historic Preservation Office for review and comment.

4. Should human remains be discovered during construction of the proposed project, the project contractor would be subject to the State law regarding the discovery and disturbance of human remains. In that circumstance destructive activity in the immediate vicinity shall halt and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5. If the remains are determined to be of Native American origin, the Native American Heritage Commission (NAHC) shall be contacted. The NAHC will make a determination of the Most Likely Descendent (MLD). The City and Developer will work with the designated MLD to determine the final disposition of the remains.

The Agua Caliente appreciates your interest in our cultural heritage. If you have questions, need monitors or require additional information, please call me at (760) 699-6912. You may also email me at smilanovich@aguacaliente-nsn.gov.

Cordially,

Sean Milanovich
Cultural Specialist

Dear Mr. Olivas:

Re: Notice of Preparation of a
Draft Environmental Impact Report
CUP 3670

We have reviewed this case and have the following comments:

The Draft Environmental Impact Report (DEIR) analyzes the potential environmental impacts of Conditional Use Permit No. 3670. Conditional Use Permit No. 3670 proposes to construct and operate a 485-MW solar photovoltaic electric generating facility and associated infrastructure. The 3,660-acre site is located in the Blythe area, east of the Blythe Municipal Airport, west of Neighbors Boulevard, and north and south of Interstate 10.

The site is subject to offsite flows from the northwest and southwest with total tributary drainage areas of approximately 42 and 9 square miles, respectively. In general, these flows enter the site in a broad sheet flow manner. A natural watercourse bisects the lower southern portion of the project (APNs 879-090-043, 879-090-044, 879-090-050 and 879-090-051). The natural watercourse should be kept free of buildings and obstructions in order to maintain the natural drainage patterns of the area. It appears that the project avoids this area, however, additional information shall be provided.

Since the proposal is to construct solar panels, no increased runoff and/or flow diversion is anticipated.

The District recommends that the DEIR address the following:

1. The drainage for the overall area and site shall be described. The site's tributary drainage area shall be identified.

2. Description of how onsite storm runoff would be collected and conveyed to an adequate outlet.

3. Description of how the project is protected from offsite storm runoff and how it is collected.

4. As described above, a natural watercourse bisects the lower southern portion of the project (APNs 879-090-043, 879-090-044, 879-090-050 and 879-090-051). The DEIR shall address how the project would avoid or mitigate its impact to any floodplain/watercourse.

5. The report should identify any existing drainage facility within the area. A description of who owns and maintains the facility shall also be included.

6. The impacts and mitigation for water quality caused by the development and proposed mitigations shall be discussed.

7. The NOP indicates "light grubbing" and "minimal grading" will be performed as part of this development. A grading and drainage plan shall be included in the DEIR. The property's maintenance access and site grading shall be designed in a manner that perpetuates the existing natural drainage patterns with respect to tributary drainage areas, outlet points and outlet conditions.

8. Hydrology/hydraulic study, exhibits and other pertinent information shall also be included.

Any questions pertaining to this project may be directed to Tina Hanson of this office at 951.955.2511 or me at 951.955.1214.

Very truly yours,

MEKBIB DEGAGA

NOTICE PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT NO. 529/CUP NO. 3670/PUP NO. 913 FOR THE BLYTHE MESA I SOLAR PROJECT, (SCH#201111056), RIVERSIDE COUNTY

Dear Mr. Olivas:

The Department of Toxic Substances Control (DTSC) has received your submitted Notice of Preparation for a draft Environmental Impact Report (EIR) for the above-mentioned project. The following project description is stated in your document: "The proposed project consists of the construction and operation of a 485 megawatt (MW) solar photovoltaic (PV) electric generating facility and associated infra structure on a total of approximately 3,660 acres. The Project site would be secured 24 hours per day by onsite private security personnel or remote services with motion-detection cameras. A new 8.4 mile long, 230 kilovolt (kV) double-circuit generation-tie transmission line would connect the proposed project with the approved Colorado River Substation located west of the project site subject to Public Use Permit (PUP). A majority of the project is within the County of Riverside jurisdiction. An approximately 330-acre portion of the 3,660-acre project site is located within the City of Blythe jurisdiction. The Project is located approximately 5 miles west of central Blythe and 40 miles east of Desert Center, more specifically, the project is located north and south of Interstate 10 (I-10) west of Neighbors Boulevard and Arrowhead Boulevard, south and east of the Blythe Airport. The site consists of primarily of agricultural land located south and east of the community of Nicholls Warm Springs/Mesa Verde. The proposed Project would be conditionally consistent with the agricultural land use designation, subject to issuance of a conditional use permit (CUP)".

Based on the review of the submitted document DTSC has the following comments:

1) The EIR should evaluate whether conditions within the Project area may pose a threat to human health or the environment. Following are the databases of some of the regulatory agencies:

- National Priorities List (NPL): A list maintained by the United States Environmental Protection Agency (U.S.EPA).
- EnviroStor (formerly CalSites): A Database primarily used by the California Department of Toxic Substances Control, accessible through DTSC's website (see below).
- Resource Conservation and Recovery Information System (RCRIS): A database of RCRA facilities that is maintained by U.S. EPA.
- Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS): A database of CERCLA sites that is maintained by U.S.EPA.
- Solid Waste Information System (SWIS): A database provided by the California Integrated Waste Management Board which consists of both open as well as closed and inactive solid waste disposal facilities and transfer stations.
- GeoTracker: A List that is maintained by Regional Water Quality Control Boards.
- Local Counties and Cities maintain lists for hazardous substances cleanup sites and leaking underground storage tanks.
- The United States Army Corps of Engineers, 911 Wilshire Boulevard, Los Angeles, California, 90017, (213) 452-3908, maintains a list of Formerly Used Defense Sites (FUDS).

2) The EIR should identify the mechanism to initiate any required investigation and/or remediation for any site within the proposed Project area that may be contaminated, and the government agency to provide appropriate regulatory oversight. If necessary, DTSC would require an oversight agreement in order to review such documents.

3) Any environmental investigations, sampling and/or remediation for a site should be conducted under a Workplan approved and overseen by a regulatory agency that has jurisdiction to oversee hazardous substance cleanup. The findings of any investigations, including any Phase I or II Environmental Site Assessment Investigations should be summarized in the document. All

sampling results in which hazardous substances were found above regulatory standards should be clearly summarized in a table. All closure, certification or remediation approval reports by regulatory agencies should be included in the EIR.

4) If buildings, other structures, asphalt or concrete-paved surface areas are being planned to be demolished, an investigation should also be conducted for the presence of other hazardous chemicals, mercury, and asbestos containing materials (ACMs). If other hazardous chemicals, lead-based paints (LPB) or products, mercury or ACMs are identified, proper precautions should be taken during demolition activities. Additionally, the contaminants should be remediated in compliance with California environmental regulations and policies.

5) Future project construction may require soil excavation or filling in certain areas. Sampling may be required. If soil is contaminated, it must be properly disposed and not simply placed in another location onsite. Land Disposal Restrictions (LDRs) may be applicable to such soils. Also, if the project proposes to import soil to backfill the areas excavated, sampling should be conducted to ensure that the imported soil is free of contamination.

6) Human health and the environment of sensitive receptors should be protected during any construction or demolition activities. If necessary, a health risk assessment overseen and approved by the appropriate government agency should be conducted by a qualified health risk assessor to determine if there are, have been, or will be, any releases of hazardous materials that may pose a risk to human health or the environment.

7) If the site was used for agricultural, livestock or related activities, onsite soils and groundwater might contain pesticides, agricultural chemical, organic waste or other related residue. Proper investigation, and remedial actions, if necessary, should be conducted under the oversight of and approved by a government agency at the site prior to construction of the project.

8) If it is determined that hazardous wastes are, or will be, generated by the proposed operations, the wastes must be managed in accordance with the California Hazardous Waste Control Law (California Health and Safety Code, Division 20, Chapter 6.5) and the Hazardous Waste Control Regulations (California Code of Regulations, Title 22, Division 4.5). If it is determined that hazardous wastes will be generated, the facility should also obtain a United States Environmental Protection Agency Identification Number by contacting (800) 618-6942. Certain hazardous waste treatment processes or hazardous materials, handling, storage or uses may require authorization from the local Certified Unified Program Agency (CUPA). Information about the requirement for authorization can be obtained by contacting your local CUPA.

9) DTSC can provide cleanup oversight through an Environmental Oversight Agreement (EOA) for government agencies that are not responsible parties, or a Voluntary Cleanup Agreement (VCA) for private parties. For additional information on the EOA or VCA, please see www.dtsc.ca.gov/SiteCleanup/Brownfields, or contact Ms. Maryam Tasnif-Abbasi, DTSC's Voluntary Cleanup Coordinator, at (714) 484-5489.

If you have any questions regarding this letter, please contact Rafiq Ahmed, Project Manager, at rahmed@dtsc.ca.gov, or by phone at (714) 484-5491.

Sincerely,

Greg Holmes

Re: Notice of Preparation of a Draft Environmental Impact Report for the Blythe Mesa I Solar Project

Dear Mr. Olivas,

The Mojave Desert Air Quality Management District (District) has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Blythe Mesa I Solar Project. The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on a total of approximately 3,660 acres. The proposed project would consist of a solar array field utilizing single-axis solar PV trackers and panels with a combined maximum height of eight feet. Supporting facilities on-site would include three electrical substations, two operation and maintenance buildings, inverters, transformers, and associated switchgear. A new 8.4 mile long, 230 kV double-circuit generation-tie transmission line would connect the proposed project with the Approved Colorado River Substation.

The District has no special comments or information that would be necessary to the environmental review process. District attainment plans are located at http://www.mdaqmd.ca.gov/index.aspx?page=13 for your information and review.

The District supports the development of renewable energy sources; such development is expected to produce cumulative and regional environmental benefits.

Thank you for the opportunity to review this notice of preparation. If you have any questions regarding this letter, please contact me at (760) 245-1661 or Tracy Walters at ext. 6122.

Sincerely,

Alan J. De Salvio
Supervising Air Quality Engineer

Re: SCH#2011111056 CEQA Notice of Preparation (NOP); draft Environmental Impact Report (DEIR) for the **"EIR No. 529/CUP No. 3670/PUP No. 913/Blythe Mesa I Solar Project"** located in the Blythe Area of eastern Riverside County, California

Dear Mr. Olivas:

The Native American Heritage Commission (NAHC), the State of California 'Trustee Agency' for the protection and preservation of Native American cultural resources pursuant to California Public Resources Code §21070 and affirmed by the Third Appellate Court in the case of EPIC v. Johnson (1985: 170 Cal App. 3rd 604). The court held that the NAHC has jurisdiction and special expertise, as a state agency, over affected Native American resources, impacted by proposed projects including archaeological, places of religious significance to Native Americans and burial sites. The NAHC wishes to comment on the proposed project.

This letter includes state and federal statutes relating to Native American historic properties of religious and cultural significance to American Indian tribes and interested Native American individuals as 'consulting parties' under both state and federal law. State law also addresses the freedom of Native American Religious Expression in Public Resources Code §5097.9.

The California Environmental Quality Act (CEQA – CA Public Resources Code 21000-21177, amendments effective 3/18/2010) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the CEQA Guidelines defines a significant impact on the environment as 'a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ...objects of historic or aesthetic significance." In order to comply with this provision, the lead agency is required to assess whether the project will have an adverse impact on these resources within the 'area of potential effect (APE), and if so, to mitigate that effect.

The NAHC Sacred Lands File (SLF) search resulted as follows: **Native American cultural resources were not identified** within the project area identified (e.g. 'area of potential effect' or APE). Also, the absence of archaeological resources does not preclude their existence. . California Public Resources Code §§5097.94 (a) and 5097.96 authorize the NAHC to establish a Sacred Land Inventory to record Native American sacred sites and burial sites. These records are exempt from the provisions of the California Public Records Act pursuant to. California Government Code §6254 (r). The purpose of this code is to protect such sites from vandalism, theft and destruction. The NAHC "Sacred Sites,' as defined by the Native American Heritage Commission and the California Legislature in California Public Resources Code

§§5097.94(a) and 5097.96. Items in the NAHC Sacred Lands Inventory are confidential and exempt from the Public Records Act pursuant to California Government Code §6254 (r). This area is known to the NAHC to be culturally sensitive.

Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries of cultural resources or burial sites once a project is underway. Culturally affiliated tribes and individuals may have knowledge of the religious and cultural significance of the historic properties in the project area (e.g. APE). We strongly urge that you make contact with the list of Native American Contacts on the list of Native American contacts, to see if your proposed project might impact Native American cultural resources and to obtain their recommendations concerning the proposed project. Special reference is made to the *Tribal Consultation* requirements of the California 2006 Senate Bill 1059: enabling legislation to the federal Energy Policy Act of 2005 (P.L. 109-58), mandates consultation with Native American tribes (both federally recognized and non federally recognized) where electrically transmission lines are proposed. This is codified in the California Public Resources Code, Chapter 4.3 and §25330 to Division 15.

Furthermore, pursuant to CA Public Resources Code § 5097.95, the NAHC requests that the Native American consulting parties be provided pertinent project information. Consultation with Native American communities is also a matter of environmental justice as defined by California Government Code §65040.12(e). Pursuant to CA Public Resources Code §5097.95, the NAHC requests that pertinent project information be provided consulting tribal parties. The NAHC recommends *avoidance* as defined by CEQA Guidelines §15370(a) to pursuing a project that would damage or destroy Native American cultural resources and Section 2183.2 that requires documentation, data recovery of cultural resources.

Consultation with tribes and interested Native American consulting parties, on the NAHC list, should be conducted in compliance with the requirements of federal NEPA and Section 106 and 4(f) of federal NHPA (16 U.S.C. 470 *et seq*), 36 CFR Part 800.3 (f) (2) & .5, the President's Council on Environmental Quality (CSQ, 42 U.S.C 4371 *et seq.* and NAGPRA (25 U.S.C. 3001-3013) as appropriate. The 1992 *Secretary of the Interiors Standards for the Treatment of Historic Properties* were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including cultural landscapes. Also, federal Executive Orders Nos. 11593 (preservation of cultural environment), 13175 (coordination & consultation) and 13007 (Sacred Sites) are helpful, supportive guides for Section 106 consultation. The aforementioned Secretary of the Interior's *Standards* include recommendations for all 'lead agencies' to consider the historic context of proposed projects and to "research" the cultural landscape that might include the 'area of potential effect.'

Confidentiality of "historic properties of religious and cultural significance" should also be considered as protected by California Government Code §6254(r) and may also be protected under Section 304 of he NHPA or at the Secretary of the Interior discretion if not eligible for listing on the National Register of Historic Places. The Secretary may also be advised by the federal Indian Religious Freedom Act (cf. 42 U.S.C., 1996) in issuing a decision on whether or not to disclose items of religious and/or cultural significance identified in or near the APEs and possibility threatened by proposed project activity.

Furthermore, Public Resources Code Section 5097.98, California Government Code §27491 and Health & Safety Code Section 7050.5 provide for provisions for accidentally discovered archeological resources during construction and mandate the processes to be followed in the event of an accidental discovery of any human remains in a project location other than a 'dedicated cemetery'.

To be effective, consultation on specific projects must be the result of an ongoing relationship between Native American tribes and lead agencies, project proponents and their contractors, in the opinion of the NAHC. Regarding tribal consultation, a relationship built around regular meetings and informal involvement with local tribes will lead to more qualitative consultation tribal input on specific projects.

If you have any questions about this response to your request, please do not hesitate to contact me at (916) 653-6251.

Sincerely,

Dave Singleton

Riverside, CA 92502-1409

RE: Comments on the Notice of Preparation (NOP) for a Draft Environmental Impact Report (DEIR) for Blythe Mesa I Solar Project

Dear Mr. Olivas:

The Riverside County Waste Management Department (RCWMD) has reviewed the NOP for a DEIR for the Blythe Mesa I Solar Project. The RCWMD requests that the following potential project impact areas be analyzed and evaluated in the forthcoming DEIR:

1. The RCWMD is concerned about the quantity of construction and demolition (C&D) waste that could be generated by the project and how the waste will be disposed of. Should a large quantity of the projects' C&D waste be brought to a county landfill for disposal, it could exceed the landfill's daily permitted capacity, thus a violation of State regulations and an impact to County landfill operation. The DEIR should analyze this potential solid waste impact.

   CR&R is the franchise waste hauler for the project area. This hauler operates under a waste delivery agreement (WDA) which stipulates that any waste generated within the franchise area, including solid waste generated from the Project area, will be disposed of at the Blythe Landfill. The Blythe Landfill is described below:

   Blythe Landfill
   The Blythe Landfill is located at 1000 Midland Road, Blythe, CA, 92225. The landfill is owned and operated by the RCWMD. The landfill property encompasses approximately 335-acres, of which 78 acres are permitted for waste disposal. The landfill is currently permitted to receive a maximum of 400 tons per day of refuse, and as of January 1, 2011, had a remaining capacity of approximately 650,000 tons. It is estimated that the remaining disposal capacity will last until approximately 2047. During 2010, the Blythe Landfill accepted a daily average volume of 60 tons, for a period total of approximately 16,256 tons.

2. In order to preserve landfill capacity and support efforts to recycle, reuse, and/or reduce the amount of recyclable material going to the landfill, the Project will be conditioned to implement the following measures (see attached):

- **Prior to issuance of a grading and/or building permit**, A Waste Recycling Plan (WRP) shall be submitted to the Riverside County Waste Management Department for approval. At a minimum, the WRP must identify the materials (i.e., cardboard, concrete, asphalt, wood, etc.) that will be generated by construction and development, the projected amounts, the measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials, the facilities and/or haulers that will be utilized, and the targeted recycling or reduction rate. During project construction, the project site shall have, at a minimum, two (2) bins: one for waste disposal and the other for the recycling of Construction and Demolition (C&D) materials. Additional bins are encouraged to be used for further source separation of C&D recyclable materials. Accurate record keeping (receipts) for recycling of C&D recyclable materials and solid waste disposal must be kept. Arrangements can be made through the franchise hauler

- **Prior to final building inspection,** evidence (i.e., receipts or other type of verification) to demonstrate project compliance with the approved WRP shall be presented by the project proponent to the Planning Division of the Riverside County Waste Management Department. Receipts must clearly identify the amount of waste disposed and Construction and Demolition (C&D) materials recycled.

3. Hazardous materials are not accepted at Riverside County landfills. In compliance with federal, state, and local regulations and ordinances, any hazardous waste generated in association with the project shall be disposed of at a permitted Hazardous Waste disposal facility. Hazardous waste materials include, but are not limited to, paint, batteries, oil, asbestos, and solvents. For further information regarding the determination, transport, and disposal of hazardous waste, please contact the Riverside County Department of Environmental Health, Environmental Protection and Oversight Division, at 1.888.722.4234.

Thank you for the allowing us the opportunity to comment on the NOP. Please continue to include the RCWMD in future transmittals. Feel free to call me at (951) 486-3351 if you have any questions regarding the above comments.

Sincerely,

Ryan Ross
Planner IV

RE: Conditional Use Plan (CUP) No. 3670
Proposal: The CUP proposes the development of a 485 MW photovoltaic facility on 3,428 acres (Blythe Mesa Solar)
APNs: 821-110-004, etc.

Dear Mr. Olivas:

The Riverside County Waste Management Department (Department) has reviewed the proposed project, located east of the Blythe Airport and west of Neighbors Boulevard, in the Palo Verde Area Plan. In order to mitigate the project's potential solid waste impacts and to help the County's efforts to comply with State law in diverting solid waste from landfill disposal, the Department is recommending that the following conditions be made a part of any Conditions of Approval for the project:

1. **Prior to issuance of a grading and/or building permit,** A Waste Recycling Plan (WRP) shall be submitted to the Riverside County Waste Management Department for approval. At a minimum, the WRP must identify the materials (i.e., cardboard, concrete, asphalt, wood, etc.) that will be generated by construction and development, the projected amounts, the measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials, the facilities and/or haulers that will be utilized, and the targeted recycling or reduction rate. During project construction, the project site shall have, at a minimum, two (2) bins: one for waste disposal and the other for the recycling of Construction and Demolition (C&D) materials. Additional bins are encouraged to be used for further source separation of C&D recyclable materials. Accurate record keeping (receipts) for recycling of C&D recyclable materials and solid waste disposal must be kept. Arrangements can be made through the franchise hauler

2. **Prior to final building inspection,** evidence (i.e., receipts or other type of verification) to demonstrate project compliance with the approved WRP shall be presented by the project proponent to the Planning Division of the Riverside County Waste Management Department. Receipts must clearly identify the amount of waste disposed and Construction and Demolition (C&D) materials recycled.

3. Please note that the Blythe Airport Dumpsite is located within the vicinity of the proposed solar project. For more information on the dumpsite and its location, please contact Chad Davies with the County of Riverside Economic Development Agency (EDA), Aviation Division at (951) 955-9722, or Laurie Holk with the Local Enforcement Agency (LEA) at 760-863-7008.

4. Hazardous materials are not accepted at Riverside County landfills. In compliance with federal, state, and local regulations and ordinances, any hazardous waste generated in association with the project shall be disposed of at a permitted Hazardous Waste disposal facility. Hazardous waste materials include, but are not limited to, paint, batteries, oil, asbestos, and solvents. For further information regarding the determination, transport, and disposal of hazardous waste, please contact the Riverside County Department of Environmental Health, Environmental Protection and Oversight Division, at 1.888.722.4234.

5. Use mulch and/or compost in the development and maintenance of landscaped areas within the project boundaries. Recycle green waste through either onsite composting of grass, i.e., leaving the grass clippings on the lawn, or sending separated green waste to a composting facility.

6. Consider xeriscaping and using drought tolerant/low maintenance vegetation in all landscaped areas of the project.

Thank you for the opportunity to review this proposal. If you have any questions, please call me at (951) 486-3351.

Sincerely,

Ryan Ross

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Blythe Mesa I Solar Project [I20110201]

Dear Mr. Olivas:

Thank you for submitting the **Notice of Preparation of a Draft Environmental Impact Report for the Blythe Mesa I Solar Project [I20110201]** to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review of Programs proposed for federal financial assistance and direct development activities, pursuant to Presidential Executive Order 12372 (replacing A-95 Review). Additionally, pursuant to Public Resources Code Section 21083(d) SCAG reviews Environmental Impact Reports of projects of regional significance for consistency with regional plans per the California Environmental Quality Act Guidelines, Sections 15125(d) and 15206(a)(1). SCAG is also the designated Regional Transportation Planning Agency and as such is responsible for both preparation of the Regional Transportation Plan (RTP) and Federal Transportation Improvement Program (FTIP) under California Government Code Section 65080 and 65082.

SCAG staff has reviewed this project and determined that the proposed project is regionally significant per California Environmental Quality Act (CEQA) Guidelines, Sections 15125 and/or 15206. The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic electric generating facility and associated infrastructure on a total of approximately 3,660 acres in the City of Blythe and unincorporated Riverside County.

Policies of SCAG's Regional Transportation Plan (RTP) and Compass Growth Visioning (CGV) that may be applicable to your project are outlined in the attachment. The RTP, CGV, and table of policies can be found on the SCAG web site at: http://scag.ca.gov/igr. For ease of review, we would encourage you to use a side-by-side comparison of all SCAG policies with a discussion of the consistency, non-consistency or non-applicability of the policy and supportive analysis in a table format (example attached).

The attached policies are meant to provide guidance for considering the proposed project within the context of our regional goals and policies. We also encourage the use of the SCAG List of Mitigation Measures extracted from the RTP to aid with demonstrating consistency with regional plans and policies. **When available, please send environmental documentation ONLY to SCAG's main office in Los Angeles and provide a minimum of 45 days for SCAG to review.** If you have any questions regarding the attached comments, please contact Pamela Lee at (213) 236-1895 or leep@scag.ca.gov. Thank you.

Sincerely,

Jacob Lieb, Manager
Environmental and Assessment Services

December 19, 2011 **SCAG No. I20110201**
Mr. Olivas

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE BLYTHE MESA I SOLAR PROJECT [I20110201]

PROJECT LOCATION

The Blythe Mesa I Solar Project is located approximately 5 miles west of central Blythe and 40 miles east of Desert Center; more specifically, the project is located north and south of Interstate 10, west of Neighbors Boulevard and Arrowhead Boulevard, south and east of the Blythe Airport. The site consists of primarily agricultural land located south and east of the community of Nicholls Warm Springs/Mesa Verde.

PROJECT DESCRIPTION

The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on a total of approximately 3,660 acres. The proposed project would consist of a solar array field utilizing single-axis solar PV trackers and panels with a combined maximum height of 8 feet. Supporting facilities on-site would include three electrical substations, two operation and maintenance buildings, inverters, transformers, and associated switchgear. The project site would be secured 24 hours a day by onsite private security personnel or remote services with motion-detection cameras. An equestrian wire, wildlife-friendly and drainage-compatible security fence would be placed around the perimeter of the site. The proposed lighting for the site would be consistent with the County building code. A new 8.4 mile long, 230 kilovolt (kV) double-circuit generation-tie transmission line would connect the proposed project with the approved Colorado River Substation located west of the project site (3.6 miles of the gen-tie line are located within the project site, and 4.8 miles are located off-site between the project site and the Colorado River Substation). A majority of the project is within the County of Riverside jurisdiction. An approximate 330-acre portion of the 3,660-acre project site is located within the City of Blythe jurisdiction. A Development Agreement between the County of Riverside and the applicant will be established setting forth the rights and responsibilities of each party with respect to project development and operation.

CONSISTENCY WITH REGIONAL TRANSPORTATION PLAN

Regional Growth Forecasts

The DEIR should reflect the most current SCAG forecasts, which are the 2008 RTP (May 2008) Population, Household and Employment forecasts. The forecasts for your region, subregion and city are as follows:

Adopted SCAG Regionwide Forecasts[1]

	2010	2015	2020	2025	2030	2035
Population	19,418,344	20,465,830	21,468,948	22,395,121	23,255,377	24,057,286
Households	6,086,986	6,474,074	6,840,328	7,156,645	7,449,484	7,710,722
Employment	8,349,453	8,811,406	9,183,029	9,546,773	9,913,376	10,287,125

Adopted Coachella Valley Association of Governments Subregion Forecasts[1]

	2010	2015	2020	2025	2030	2035
Population	507,318	590,368	712,462	827,009	929,522	1,045,814
Households	174,485	202,268	241,275	281,289	317,209	354552
Employment	196,475	220,121	244,519	267,606	289,564	315289

Adopted City of Blythe Forecasts[1]

	2010	2015	2020	2025	2030	2035
Population	23,124	24,170	25,897	26,496	27,011	27,626
Households	4,806	5,116	5,645	5,914	6,152	6,399
Employment	6,225	6,539	6,923	7,198	7,375	7,551

1. The 2008 RTP growth forecast at the regional, subregional, and city level was adopted by the Regional Council in May 2008. City totals are the sum of small area data and should be used for advisory purposes only.

The **2008 Regional Transportation Plan (RTP)** also has goals and policies that may be pertinent to this proposed project. This RTP links the goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption, promoting transportation-friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic and commercial limitations. The RTP continues to support all applicable federal and state laws in implementing the proposed project. Among the relevant goals and policies of the RTP are the following:

Regional Transportation Plan Goals:

RTP G1 *Maximize mobility and accessibility for all people and goods in the region.*
RTP G2 *Ensure travel safety and reliability for all people and goods in the region.*
RTP G3 *Preserve and ensure a sustainable regional transportation system.*
RTP G4 *Maximize the productivity of our transportation system.*
RTP G5 *Protect the environment, improve air quality and promote energy efficiency.*
RTP G6 *Encourage land use and growth patterns that complement our transportation investments.*
RTP G7 *Maximize the security of our transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.*

GROWTH VISIONING

The fundamental goal of the **Compass Growth Visioning** effort is to make the SCAG region a better place to live, work and play for all residents regardless of race, ethnicity or income class. Thus, decisions regarding growth, transportation, land use, and economic development should be made to promote and sustain for future generations the region's mobility, livability and prosperity. The following "Regional Growth Principles" are proposed to provide a framework for local and regional decision making that improves the quality of life for all SCAG residents. Each principle is followed by a specific set of strategies intended to achieve this goal.

Principle 1: Improve mobility for all residents.

GV P1.1 *Encourage transportation investments and land use decisions that are mutually supportive.*
GV P1.2 *Locate new housing near existing jobs and new jobs near existing housing.*
GV P1.3 *Encourage transit-oriented development.*
GV P1.4 *Promote a variety of travel choices*

Principle 2: Foster livability in all communities.

GV P2.1 *Promote infill development and redevelopment to revitalize existing communities.*
GV P2.2 *Promote developments, which provide a mix of uses.*
GV P2.3 *Promote "people scaled," walkable communities.*
GV P2.4 *Support the preservation of stable, single-family neighborhoods.*

Principle 3: Enable prosperity for all people.

GV P3.1 *Provide, in each community, a variety of housing types to meet the housing needs of all income levels.*

GV P3.2 *Support educational opportunities that promote balanced growth.*
GV P3.3 *Ensure environmental justice regardless of race, ethnicity or income class.*
GV P3.4 *Support local and state fiscal policies that encourage balanced growth*
GV P3.5 *Encourage civic engagement.*

Principle 4: Promote sustainability for future generations.
GV P4.1 *Preserve rural, agricultural, recreational, and environmentally sensitive areas*
GV P4.2 *Focus development in urban centers and existing cities.*
GV P4.3 *Develop strategies to accommodate growth that uses resources efficiently, eliminate pollution and significantly reduce waste.*
GV P4.4 *Utilize "green" development techniques*

CONCLUSION

As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans. This activity is based on SCAG's responsibilities as a regional planning organization pursuant to state and federal laws and regulations. Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of regional goals and policies.

All feasible measures needed to mitigate any potentially negative regional impacts associated with the proposed project should be implemented and monitored, as required by CEQA. We recommend that you review the SCAG List of Mitigation Measures for additional guidance, and encourage you to follow them, where applicable to your project. The SCAG List of Mitigation Measures may be found here: http://www.scag.ca.gov/igr/documents/SCAG_IGRMMRP_2008.pdf

December 19, 2011 **SCAG No. I20110201**
Mr. Olivas

SUGGESTED SIDE BY SIDE FORMAT - COMPARISON TABLE OF SCAG POLICIES

For ease of review, we would encourage the use of a side-by-side comparison of all SCAG policies with a discussion of the consistency, non-consistency or not applicable of the policy and supportive analysis in a table format. All policies and goals must be evaluated as to impacts. Suggested format is as follows:

The complete table can be found at: http://www.scag.ca.gov/igr/

- Click on ***"Demonstrating Your Project's Consistency With SCAG Policies"***
- Scroll down to ***"Table of SCAG Policies for IGR"***

SCAG Regional Transportation Plan Goals and Compass Growth Visioning Principles		
Regional Transportation Plan Goals		
Goal/ Principle Number	**Policy Text**	**Statement of Consistency, Non-Consistency, or Not Applicable**
RTP G1	Maximize mobility and accessibility for all people and goods in the region.	***Consistent:*** *Statement as to why* ***Not-Consistent:*** *Statement as to why* *or* ***Not Applicable:*** *Statement as to why*
RTP G2	Ensure travel safety and reliability for all people and goods in the region.	***Consistent:*** *Statement as to why* ***Not-Consistent:*** *Statement as to why* *or* ***Not Applicable:*** *Statement as to why*
RTP G3	Preserve and ensure a sustainable regional transportation system.	***Consistent:*** *Statement as to why* ***Not-Consistent:*** *Statement as to why* *or* ***Not Applicable:*** *Statement as to why*
Etc.	Etc.	Etc.

P.O. Box 1409
Riverside, CA 92502-1409

RE: Notice of Preparation (NOP) for the Blythe Mesa I Solar Project

Dear Mr. Olivas:

Southern California Edison (SCE) appreciates the opportunity to provide comment on the NOP for the Blythe Solar PV I Project (Conditional Use Permit No. 3670) by Renewable Resources Group. The project is described as a proposal to develop a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on approximately 3,660 acres of land within the County of Riverside. Specifically, the project is stated to be located north and south of Interstate 10, west of Neighbors Boulevard and Arrowhead Boulevard, south and east of the Blythe Airport.

The proposed project includes a new 8.4 mile long, 230 kV double-circuit generator-tie line that will connect the proposed project with the approved Colorado River Substation located west of the project site. 3.6 miles of the gen-tie line are located within the project site, and 4.8 miles are located off-site between the project site and the Colorado River Substation.

Interconnection of renewable generators into SCE's California Independent System Operator (CAISO)-controlled grid is established through an application to CAISO under their rules and tariffs. SCE and CAISO work together to determine, through a series of Interconnection Studies, the new and/or upgraded electrical facilities required to be constructed to support interconnection of the project into SCE's transmission system. The generator enters into an Interconnection Agreement with SCE and CAISO to interconnect and operate its generation project, and for SCE to design, construct, install, operate and maintain any facilities or upgrades, and for the customer to pay for such upgrades. The Agreement also allows for refunds to be provided to the customer for any network upgrades financed up-front by the customer, pursuant to the Federal Energy Regulatory Commission (FERC) Tariff. Currently, the process includes projects studied serially and in clusters, which are queued for study purposes and for scheduling of construction activities.

CPUC Certificate of Public Convenience and Necessity (CPCN) Requirements

If the SCE interconnection facilities to be constructed or relocated are over 200 kV, GO 131-D, Section III.A requires SCE to obtain a CPCN from the CPUC unless certain exceptions apply. Accordingly, SCE would need to consult on a case-by-case basis with the CPUC for such projects to determine if the CPUC would allow the project to proceed "exempt" or instead allow SCE to proceed under an "expedited" CPCN application by attaching the final CEQA document completed by the Lead Agency in lieu of an SCE PEA.

24487 Prielipp Rd.
Wildomar, CA 92595

Office: (951) 249-8468
E-mail: louis.davis@sce.com

Such an expedited CPCN would typically take from 4-6 months for the CPUC to process.

For the benefits and reasons stated above, it is assumed that the project proponent for the generation project will include SCE's interconnection facilities and network upgrades work scope (including facilities to be constructed by others and deeded to SCE) in the reports/applications submitted to the Lead Agency permitting/entitling the generation project (e.g., California Energy Commission or applicable local, state or federal permitting agency, such as the Bureau of Land Management), and that such agencies will review the potential environmental impacts associated with SCE's work scope in any environmental document issued. However, depending on certain circumstances, the CPUC may still require SCE to undergo a standard PTC or CPCN for the generator tie-line and network upgrades associated with the generation project.

SCE Scope of Work NOT Subject to CPUC General Order 131-D

Certain SCE facilities and scope of work may not be subject to the CPUC's GO 131-D. In such instances, SCE will follow any and all other applicable environmental laws and regulations. In some cases, SCE will be required to obtain permits for SCE facilities and scope of work from state and federal agencies under other environmental laws and regulations, such as California Fish and Game Code, Clean Water Act, and Endangered Species Act. State and federal agencies may be required to comply with CEQA and NEPA prior to issuing their permits. The Lead Agency may also require evaluation of SCE's facilities and scope of work as part of the proposed generation project.

Coordination with SCE

For these reasons, SCE recommends that the project proponent and Lead Agency coordinate with SCE early in its environmental review process to identify the potential need to obtain certain permits for SCE facilities and scope of work necessary to interconnect the proposed project. SCE further suggests the project proponent submit to the Lead Agency information on the foreseeable SCE scope of work and its associated impacts, so that the Lead Agency can analyze such impacts during its environmental review process as appropriate. In this manner, the Lead Agency may coordinate with responsible agencies (under CEQA) or with cooperating agencies (under NEPA) to appropriately analyze impacts of the other agencies' actions and reduce the need for supplemental analyses and amendments to circulated environmental documents. In addition, SCE recommends that the project proponent coordinates with SCE when obtaining environmental permits in case both parties require permits issued under the same authorities.

For facilities that are not subject to GO 131-D, once all pre-construction requirements of applicable environmental laws and regulations are complied with, SCE would issue an in-house Environmental Clearance before commencement of its construction activities.

Impacts to SCE Facilities or Land Rights

In the event the project proposes to impact SCE facilities or its land related rights, please forward five (5) sets of project plans depicting SCE's facilities and its associated land rights to the following location for review:

Real Properties Department
Southern California Edison Company
2131 Walnut Grove Avenue, G.O.3 – Second Floor
Rosemead, CA 91770

Once again, SCE appreciates the opportunity to comment on the NOP for this project and looks forward to working closely with the applicant and the Lead Agency to support interconnection of this project into SCE's CAISO controlled transmission grid (or through SCE's WDAT). Please notify SCE when the DEIR for this project becomes available for public review. If you have any questions regarding this letter, please do not hesitate to contact me at (951) 249-8468.

Sincerely,

Louis Davis
Local Public Affairs Region Manager
Southern California Edison Company

Notice of Preparation

November 18, 2011

To: Reviewing Agencies

Re: EIR No. 529/CUP No. 3670/PUP No. 913/Blythe Mesa I Solar Projejct
SCH# 2011111056

Attached for your review and comment is the Notice of Preparation (NOP) for the EIR No. 529/CUP No. 3670/PUP No. 913/Blythe Mesa I Solar Projejct draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Jay Olivas
Riverside County
4080 Lemon Street, 9th Floor
P.O. Box 1409
Riverside, CA 92502-1409

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Document Details Report
State Clearinghouse Data Base

SCH#	2011111056
Project Title	EIR No. 529/CUP No. 3670/PUP No. 913/Blythe Mesa I Solar Projejct
Lead Agency	Riverside County

Type	NOP Notice of Preparation
Description	The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on a total of ~3,6660 acres. The proposed project would consist of a solar array field utilizing single-axis solar PV trackers and panels with a combined maximum height of 8 feet. Supporting facilities on-site would include three electrical substations, two operation and maintenance buildings, inverters, transformers, and associated switchgear. Since most of the site has nearly level to gently sloping topography, no mass grading would be required and the natural drainage patterns of the site would not be significantly altered. The project site would be secured 24 hours per day by onsite private security personnel or remote services with motion-detection cameras. An equestrian-wire, wildlife-friendly and drainage-compatible security fence that meets National Electric Safety Code would be placed around the perimeter of the site. The proposed lighting for the site would be consistent with County building code. A new 8.4 mile long, 230 kv double-circuit generation-tie transmission line would connect the proposed project with the approved Colorado River Substation located west of the project site subject to Public Use Permit. A majority of the project is within the County of Riverside jurisdiction.

RIVERSIDE COUNTY
PLANNING DEPARTMENT

Carolyn Syms Luna
Director

Agency Notice of Preparation of an Draft Environmental Impact Report

Date: November 16, 2011

ATTN: Stanley Sniff, Sheriff
Sheriff's Department, Riverside County
Mail Stop 1450

PROJECT CASE NO./TITLE: Environmental Impact Report No. 529 / Conditional Use Permit No. 3670 / Public Use Permit No. 913 / Blythe Mesa I Solar Project

PROJECT LOCATION: East Riverside County - Palo Verde Area Plan, the Blythe Mesa I Solar Project is located approximately 5 miles west of central Blythe and 40 miles east of Desert Center; more specifically, the project is located north and south of Interstate 10, west of Neighbors Boulevard and Arrowhead Boulevard, south and east of the Blythe Airport. The site consists primarily of agricultural land located south and east of the community of Nicholls Warm Springs/Mesa Verde. APNs 821-110-004, 821-120-025, 821-120-026, 821-120-027, etc. (see attached sheet entitled "Blythe Mesa Solar Project" "Assessor's Parcels for Solar Field (CUP03670)". Also, as shown on the exhibits entitled "Blythe Mesa Solar Project - Topographic Quadrangle Map", "Public Use Permit", "Blythe Mesa Solar Project Conditional Use Permit #3670 Pages 1 & 2", Exhibits "A1", "Notice of Preparation Attachment A", "Figure 1: Regional Area Map", "Figure 2: Site Plan & Solar Module", and "Figure 3: Typical Tiled Tracker Panels".

PROJECT DESCRIPTION: The proposed project consists of the construction and operation of a 485 megawatt solar photovoltaic (PV) electric generating facility and associated infrastructure on a total of approximately 3,660 acres. The proposed project would consist of a solar array field utilizing single-axis solar PV trackers and panels with a combined maximum height of 8 feet. Supporting facilities on-site would include three electrical substations, two operation and maintenance buildings, inverters, transformers, and associated switchgear. Since most of the site has nearly level to gently sloping topography, no mass grading would be required and the natural drainage patterns of the site would not be significantly altered. The Project site would be secured 24 hours per day by onsite private security personnel or remote services with motion-detection cameras. An equestrian-wire, wildlife-friendly and drainage-compaitble security fence that meets National Electric Safety Code would be placed around the perimeter of the site. The proposed lighting for the site would be consistent with County building code. A new 8.4 mile long, 230 kilovolt (kV) double-circuit generation-tie transmission line would connect the proposed project with the approved Colorado River Substation located west of the project site subject to Public Use Permit (3.6 miles of the gen-tie line are located within the project site, and 4.8 miles are located off-site between the project site and the Colorado River Substation). A majority of the project is within the County of Riverside jurisdiction. An approximate 330-acre portion of the 3,660-acre project site is located within the City of Blythe jurisdiction. A Development Agreement between the County of Riverside and the applicant will be established setting forth the rights and responsibilities of each party with respect to project development and operation.

MEMORANDUM

To: Riverside Co. Planning Dept. **Date**: 12/15/2011

From: Capt. Jim Navarro
Station Commander
760-921-7900

Re: EIR No. 529, CUP No. 3670, PUP No. 913, Blythe Mesa Solar Project

The Sheriff's Department, Colorado River Station has no specific requests or changes at this time.

One comment concerning the location of the project in relation to the Sheriff's Department Shooting Range in Parcel # 824-080-004. Please be aware of our requirement to have 24-hour access to our site and that live fire activities can be occurring many times between 5:00 AM and 11:00 PM on any day of the week.

Thank you,

James D. Navarro
Sheriff's Captain

1.0 Introduction

The purpose of this Air Quality Technical Report is to describe the existing regional air quality in the air basin of the Project area; to provide a discussion of applicable federal, state, and local air quality regulations; to assess the potential air quality impacts associated with construction and operation of the Project; and to identify measures that would be required to mitigate air quality impacts or minimize emissions.

The Project's potential for air quality impacts would be mainly associated with construction activities. Construction of the project would result in emissions of tailpipe emissions from vehicles and heavy construction equipment, and in emissions of fugitive dust from site preparation activities. Operational activities would also result in emissions from vehicles and inspection and maintenance activities.

This report also provides an evaluation of emissions of greenhouse gases (GHGs) from construction and operation activities, and an evaluation of the potential for cumulative impacts associated with GHG emissions.

1.1 Study Personnel

This Air Quality Technical Report was prepared by Valorie L. Thompson, Ph.D., Principal of Scientific Resources Associated. Scientific Resources Associated specializes in Air Quality and Global Climate Change technical studies.

1.2 Project Description (Alternative 1)

The proposed Blythe Mesa Solar Project (Project) consists of construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure to provide site access and connection to the statewide electricity transmission grid. The Project is proposed to be located on approximately 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587 for the solar field and 73 acres for the 230 kilovolt (kV) transmission line interconnect (Figure 1). The power produced by the Project

would be conveyed to the local power grid via interconnection to the Southern California Edison Colorado River Substation, an approved new substation located south of Highway 10 and approximately four miles west of the Project site. The Project has secured a California Independent System Operator (CAISO) interconnection queue position sufficient for the size of the Project. The Project would produce enough energy to power approximately 180,000 households and progress the goals of the California Renewable Portfolio Standard (RPS) and other similar renewable programs in the state.

The objectives for the Blythe Mesa Solar Project are as follows:

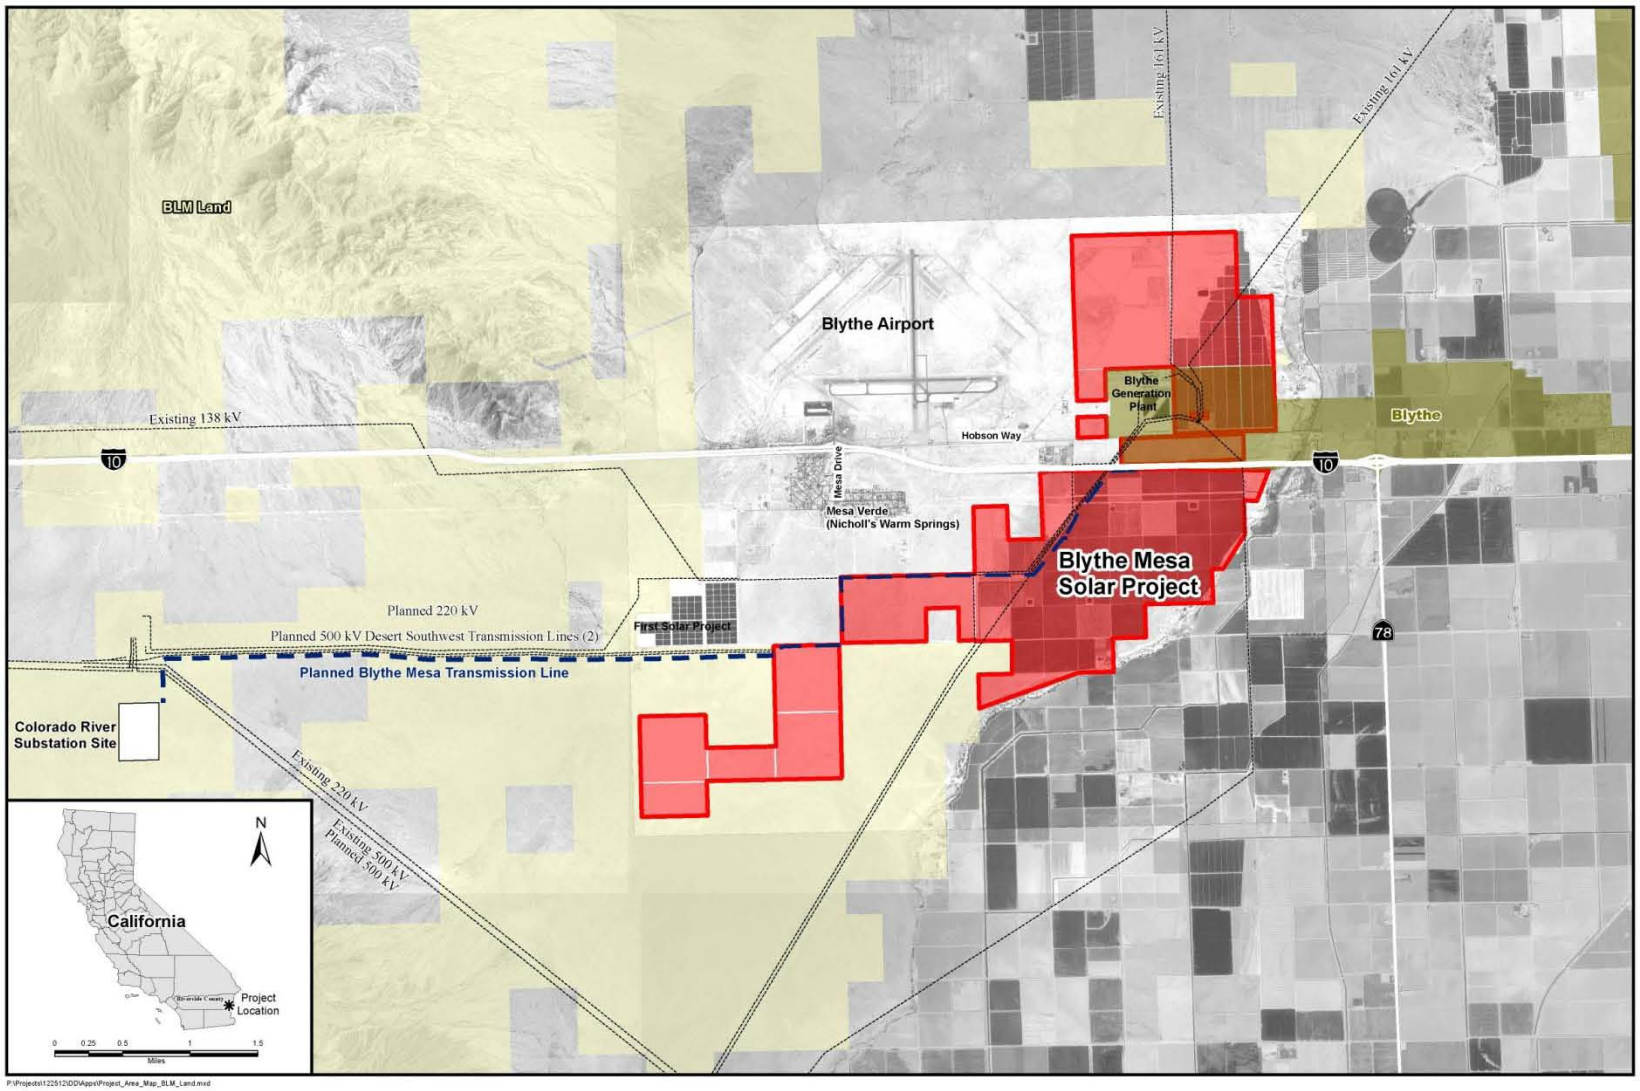
- Construct a solar energy facility in order to meet state and federal renewable energy standards and goals.
- Assist with greenhouse gas reduction objectives to the maximum extent possible.
- Locate the Project facilities as near as possible to electrical transmission facilities with anticipated capacity and reserved CASIO interconnection position.
- Site the Project in an area with excellent solar energy resource, in order to maximize productivity from the PV panels.
- To the extent feasible, site the Project on disturbed land and locate the facility on land with compatible topography in a manner that minimizes environmental impacts.
- Use a proven and available solar PV technology.

1.3 Project Alternatives

In addition to the Project (Alternative 1), this analysis addresses three project alternatives. The project alternatives include the following:

ALTERNATIVE 2: NO ACTION/PROJECT ALTERNATIVE

The No Action/Project Alternative is required by NEPA and CEQA. Under the No Action/Project Alternative, the construction of a solar generating facility and associated infrastructure would not occur. This alternative reflects existing conditions as well as what would be reasonably expected to occur in the foreseeable future if the Project was not approved and does not take place.



ALTERNATIVE 3: NORTHERN ALTERNATIVE 230 KV TRANSMISSION LINE LOCATION

Similar to Alternative 1 (Proposed Project), Alternative 3 would include the construction, operation, and potential decommissioning of a 485 MW solar PV electrical generating facility and associated infrastructure. It would occupy a total of 3,682 acres and would utilize the same solar array field as the proposed Project. The primary difference between Alternatives 1 and 3 is the location of the 230 kV transmission line that extends outside of the solar array field to the Colorado River Substation; the same 230 kV transmission alignment within the solar array field would be utilized for both Alternatives 1 and 3. The transmission alignment for Alternatives 1 and 3 would also be located within the same BLM utility corridor; however, Alternative 3 would be located on the north side of the corridor and within a 150-foot ROW entirely on BLM-managed lands. Under this alternative, the total length of the 230 kV transmission line both on-site and off-site would be 8.8 miles; 3.6 miles are located on private lands within the array site boundary and 5.2 miles located off-site on BLM managed lands. The BLM portion of the ROW would contain 95 acres.

ALTERNATIVE 4: SOUTHERN TRANSMISSION LINE ALTERNATIVE

Similar to Alternative 1, Alternative 4 would include the construction, operation, and decommissioning of a 485 MW solar PV electrical generating facility and associated infrastructure. Alternative 4 would occupy a total of 3,648 acres and would utilize the same solar array field location as the proposed Project. The primary difference between Alternatives 1 and 4 is the location of the 230 kV transmission line that extends between the solar array field (BMSP substation 3) to the Colorado River Substation. Alternative 4 would exit the southwestern portion of the solar array field and extend approximately 4.0 miles west to the Colorado River Substation within a 125-foot ROW. To facilitate this alignment, and additional 10,000 feet of 230 kV transmission line would need to be built on the solar array extending south from the BMSP substation 3 and angling west to the site boundary. The transmission line would continue westerly off-site across 3.4 miles of BLM managed lands and 0.6 miles of private lands before reaching the Colorado River Substation. Under this alternative, the total length of the 230 kV transmission line both on-site and off-site would be 9.5 miles; 5.5 miles are located on private

lands within the array site boundary and 4.0 miles located off-site (3.3 miles on BLM managed lands and 0.7 mile on private land). The total area of the ROW offsite is about 60 acres (50 acres of BLM managed land and 10 acres of private land).

2.0 Regulatory Framework

Air quality is defined by ambient air concentrations of specific pollutants determined by the United States Environmental Protection Agency (USEPA) to be of concern with respect to the health and welfare of the general public. Seven major pollutants of concern, called "criteria pollutants," are carbon monoxide (CO), sulfur dioxide (SO_2), nitrogen dioxide (NO_2), ozone (O_3), suspended particulate matter less than or equal to 10 microns in diameter (PM_{10}), fine particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$), and lead (Pb). The USEPA has established National Ambient Air Quality Standards (NAAQS) for these pollutants. Areas that violate a federal air quality standard are designated as non-attainment areas.

Ambient air quality refers to the atmospheric concentration of a specific compound (amount of pollutants in a specified volume of air) that occurs at a particular geographic location. The ambient air quality levels measured at a particular location are determined by the interactions of emissions, meteorology, and chemistry. Emission considerations include the types, amounts, and locations of pollutants emitted into the atmosphere. Meteorological considerations include wind and precipitation patterns affecting the distribution, dilution, and removal of pollutant emissions. Chemical reactions can transform pollutant emissions into other chemical substances. Ambient air quality data are generally reported as a mass per unit volume (e.g., micrograms per cubic meter of air) or as a volume fraction (e.g., parts per million [ppm] by volume).

Pollutant emissions typically refer to the amount of pollutants or pollutant precursors introduced into the atmosphere by a source or group of sources. Pollutant emissions contribute to the ambient air concentrations of criteria pollutants, either by directly affecting the pollutant concentrations measured in the ambient air or by interacting in the atmosphere to form criteria pollutants. Primary pollutants, such as CO, SO_2, Pb, and some particulates, are emitted directly into the atmosphere from emission sources.

Secondary pollutants, such as O_3, NO_2, and some particulates, are formed through atmospheric chemical reactions that are influenced by meteorology, ultraviolet light, and other atmospheric processes. PM_{10} and $PM_{2.5}$ are generated as primary pollutants by various mechanical processes

(for example, abrasion, erosion, mixing, or atomization) or combustion processes. However, PM_{10} and $PM_{2.5}$ can also be formed as secondary pollutants through chemical reactions or by gaseous pollutants condensing into fine aerosols. In general, emissions that are considered "precursors" to secondary pollutants in the atmosphere (such as reactive organic gases [ROG] and oxides of nitrogen [NOx], which are considered precursors for O_3), are the pollutants for which emissions are evaluated to control the level of O_3 in the ambient air.

The following specific descriptions of health effects for each of the criteria air pollutants associated with project construction and operations are based on information from the California Air Resources Board (ARB) (ARB 2012).

Ozone. O_3 is considered a photochemical oxidant, which is a chemical that is formed when reactive organic gases (ROG) and oxides of nitrogen (NOx), both by-products of combustion, react in the presence of ultraviolet light. O_3 is considered a respiratory irritant and prolonged exposure can reduce lung function, aggravate asthma and increase susceptibility to respiratory infections. Exposure to levels of ozone above the current ambient air quality standard can lead to human health effects such as lung inflammation and tissue damage and impaired lung functioning. Ozone exposure is also associated with symptoms such as coughing, chest tightness, shortness of breath, and the worsening of asthma symptoms. The greatest risk for harmful health effects belongs to outdoor workers, athletes, children and others who spend greater amounts of time outdoors during smoggy periods. Elevated ozone levels can reduce crop and timber yields, as well as damage native plants. Ozone can also damage materials such as rubber, fabrics and plastics. Children and those with existing respiratory diseases are at greatest risk from exposure to O_3.

Carbon Monoxide. CO is a product of combustion, and the main source of CO in the SDAB is from motor vehicle exhaust. CO is an odorless, colorless gas. Exposure to CO near the levels of the ambient air quality standards can lead to fatigue, headaches, confusion, and dizziness. CO interferes with the blood's ability to carry oxygen. Exposure to CO is especially harmful to those with heart disease, because the heart has to pump harder to get enough oxygen to the body. CO exposure has been associated with aggravation of angina pectoris and other aspects of coronary

heart disease, decreased exercise tolerance in people with peripheral vascular disease and lung disease, impairment of central nervous system functions, and possible increased risk to fetuses. At high altitudes (such as in the Lake Tahoe Air Basin), these effects are worsened. CO affects red blood cells in the body by binding to hemoglobin and reducing the amount of oxygen that can be carried to the body's organs and tissues.

Nitrogen Dioxide. NO_2 is also a by-product of fuel combustion, and is formed both directly as a product of combustion and in the atmosphere through the reaction of nitrogen oxide (NO) with oxygen. NO_2 is a respiratory irritant and may affect those with existing respiratory illness, including asthma. Exposure to NO_2 along with other traffic-related pollutants, is associated with respiratory symptoms, episodes of respiratory illness and impaired lung functioning. Studies in animals have reported biochemical, structural, and cellular changes in the lung when exposed to NO_2 above the level of the current state air quality standard. Clinical studies of human subjects suggest that NO_2 exposure to levels near the current standard may worsen the effect of allergens in allergic asthmatics, especially in children.

Respirable Particulate Matter and Fine Particulate Matter. Respirable particulate matter, or PM_{10}, refers to particulate matter with an aerodynamic diameter of 10 microns or less. Fine particulate matter, or $PM_{2.5}$, refers to particulate matter with an aerodynamic diameter of 2.5 microns or less. Particulate matter in this size range has been determined to have the potential to lodge in the lungs and contribute to respiratory problems. PM_{10} and $PM_{2.5}$ arise from a variety of sources, including road dust, diesel exhaust, combustion, tire and brake wear, construction operations and windblown dust. Extensive research indicates that exposure to outdoor PM_{10} and $PM_{2.5}$ levels exceeding current air quality standards is associated with increased risk of hospitalization for lung and heart-related respiratory illness, including emergency room visits for asthma. PM exposure is also associated with increased risk of premature deaths, especially in the elderly and people with pre-existing cardiopulmonary disease. In children, studies have shown associations between PM exposure and reduced lung function and increased respiratory symptoms and illnesses. Besides reducing visibility, the acidic portion of PM (nitrates, sulfates) can harm crops, forests, aquatic and other ecosystems.

Sulfur dioxide. SO_2 is a colorless, reactive gas that is produced from the burning of sulfur-containing fuels such as coal and oil, and by other industrial processes. Generally, the highest concentrations of SO_2 are found near large industrial sources. Effects from SO_2 exposures at levels near the one-hour standard include bronchoconstriction accompanied by symptoms, which may include wheezing, shortness of breath and chest tightness, especially during exercise or physical activity. Children, the elderly, and people with asthma, cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most susceptible to these symptoms. Continued exposure at elevated levels of SO_2 results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality. SO_2 is a respiratory irritant that can cause narrowing of the airways leading to wheezing and shortness of breath. Long-term exposure to SO_2 can cause respiratory illness and aggravate existing cardiovascular disease.

Lead. Lead in the atmosphere occurs as particulate matter. Lead has historically been emitted from vehicles combusting leaded gasoline, as well as from industrial sources. With the phase-out of leaded gasoline, large manufacturing facilities are the sources of the largest amounts of lead emissions. Because lead is only slowly excreted, exposures to small amounts of lead from a variety of sources can accumulate to harmful levels. Effects from inhalation of lead near the level of the ambient air quality standard include impaired blood formation and nerve conduction. Lead can adversely affect the nervous, reproductive, digestive, immune, and blood-forming systems. Symptoms can include fatigue, anxiety, short-term memory loss, depression, weakness in the extremities, and learning disabilities in children. Lead is also classified as a probable human carcinogen.

Sulfates. Sulfates are the fully oxidized ionic form of sulfur. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. This sulfur is oxidized to sulfur dioxide (SO_2) during the combustion process and subsequently converted to sulfate compounds in the atmosphere. The conversion of SO_2 to sulfates takes place comparatively rapidly and completely in urban areas of California due to regional meteorological features. The ARB's sulfates standard is designed to prevent aggravation of respiratory symptoms. Effects of sulfate exposure at levels above the

standard include a decrease in ventilatory function, aggravation of asthmatic symptoms and an increased risk of cardio-pulmonary disease. Sulfates are particularly effective in degrading visibility, and due to fact that they are usually acidic, can harm ecosystems and damage materials and property.

Hydrogen Sulfide. H_2S is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation. Breathing H_2S at levels above the standard would result in exposure to a very disagreeable odor. In 1984, an ARB committee concluded that the ambient standard for H_2S is adequate to protect public health and to significantly reduce odor annoyance.

Vinyl Chloride. Vinyl chloride, a chlorinated hydrocarbon, is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants and hazardous waste sites, due to microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in air causes central nervous system effects, such as dizziness, drowsiness and headaches. Long-term exposure to vinyl chloride through inhalation and oral exposure causes liver damage. Cancer is a major concern from exposure to vinyl chloride via inhalation. Vinyl chloride exposure has been shown to increase the risk of angiosarcoma, a rare form of liver cancer, in humans.

Visibility Reducing Particles. Visibility-reducing particles consist of suspended particulate matter, which is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt. The CAAQS is intended to limit the frequency and severity of visibility impairment due to regional haze. A separate standard for visibility-reducing particles that is applicable only in the Lake Tahoe Air Basin is based on reduction in scenic quality.

Toxic air contaminants (TACs) are substances that have the potential to be emitted into the ambient air that have been determined to present some level of acute or chronic health risk (cancer or non-cancer) to the general public. These pollutants may be emitted in trace amounts from various types of sources, including combustion sources.

TACs do not have ambient air quality standards. Since no safe levels of TACs can be determined, there are no air quality standards for TACs. Instead, TAC impacts are evaluated by calculating the health risks associated with a given exposure. The requirements of the Air Toxic "Hot Spots" Information and Assessment Act apply to facilities that use, produce, or emit toxic chemicals. Facilities that are subject to the toxic emission inventory requirements of the act must prepare and submit toxic emission inventory plans and reports and periodically update those reports.

The main TACs that are emitted from mobile sources such as those that would be operating to construct and operate the Blythe Mesa Solar Project include those substances that the USEPA and the Federal Highway Administration (FHWA) have identified as Mobile Source Air Toxics. The USEPA reviewed the list of TACs and identified a group of 21 TAC's as Mobile Source Air Toxics (MSATs), which are compounds emitted from highway vehicles and non-road equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels or as secondary combustion products. Metal air toxics also result from engine wear or from impurities in oil or gasoline. The USEPA also extracted a subset of this list of 21 MSAT's that it now labels as the seven priority MSATs. These are *benzene, formaldehyde, diesel particulate matter/diesel exhaust organic gases, acrolein, 1,3-butadiene, naphthalene, and polycyclic organic matter (POM)* (FHWA 2009). While these MSATs are considered the priority transportation toxics, the USEPA stresses that the lists are subject to change and may be adjusted in future rules (FHWA 2009).

The following specific descriptions of health effects for each of the criteria air pollutants associated with project construction and operations are based on information on health effects of

TACs from the California Office of Environmental Health Hazard Assessment (OEHHA 2012) and the USEPA (USEPA 2012).

Benzene. Approximately 84 percent of the benzene emitted in California comes from motor vehicles, including evaporative leakage and unburned fuel exhaust. Currently, the benzene content of gasoline is less than one percent.

Benzene is found in the air from emissions from burning coal and oil, gasoline service stations, and motor vehicle exhaust. Acute (short-term) inhalation exposure of humans to benzene may cause drowsiness, dizziness, headaches, as well as eye, skin, and respiratory tract irritation, and, at high levels, unconsciousness. Chronic (long-term) inhalation exposure has caused various disorders in the blood, including reduced numbers of red blood cells and aplastic anemia, in occupational settings. Reproductive effects have been reported for women exposed by inhalation to high levels, and adverse effects on the developing fetus have been observed in animal tests. Increased incidence of leukemia (cancer of the tissues that form white blood cells) have been observed in humans occupationally exposed to benzene. The USEPA has classified benzene as a Group A, human carcinogen.

Formaldehyde. Exposure to formaldehyde may occur by breathing contaminated indoor air, tobacco smoke, or ambient urban air. Acute (short-term) and chronic (long-term) inhalation exposure to formaldehyde in humans can result in respiratory symptoms, and eye, nose, and throat irritation. Limited human studies have reported an association between formaldehyde exposure and lung and nasopharyngeal cancer. Animal inhalation studies have reported an increased incidence of nasal squamous cell cancer. The USEPA considers formaldehyde a probable human carcinogen (Group B1).

The non-cancer adverse health effects of formaldehyde are largely a manifestation of its ability to irritate mucous membranes. As a result of its solubility in water and high reactivity, formaldehyde is efficiently absorbed into the mucus layers protecting the eyes and respiratory tract where it rapidly reacts, leading primarily to localized irritation. Acute high exposure may lead to eye, nose and throat irritation, and in the respiratory tract, nasal obstruction, pulmonary

edema and dyspnea. Prolonged or repeated exposures have been associated with allergic sensitization, respiratory symptoms (coughing, wheezing, shortness of breath), histopathological changes in respiratory epithelium, and decrements in lung function. Children, especially those with diagnosed asthma, may be more likely to show impaired pulmonary function and symptoms than are adults following chronic exposure to formaldehyde.

Diesel Particulate Matter. Diesel particulate matter is emitted from both mobile and stationary sources. In California, onroad diesel-fueled engines contribute approximately 24 percent of the statewide total, with an additional 71 percent attributed to other mobile sources such as construction and mining equipment, agricultural equipment, and transport refrigeration units. Stationary sources contribute about five percent of total diesel particulate matter.

Diesel exhaust includes over 40 substances that are listed by the USEPA as hazardous air pollutants and by the ARB as toxic air contaminants. Fifteen of these substances are listed by the International Agency for Research on Cancer (IARC) as carcinogenic to humans, or as a probable or possible human carcinogen. Some of these substances are: acetaldehyde; antimony compounds; arsenic; benzene; beryllium compounds; bis(2-ethylhexyl)phthalate; dioxins and dibenzofurans; formaldehyde; inorganic lead; mercury compounds; nickel; POM (including PAHs); and styrene. Almost all of the diesel particle mass is in the fine particle range of 10 microns or less in diameter (PM_{10}). Approximately 94 percent of the mass of these particles are less than 2.5 microns in diameter. Because of their small size, these particles can be inhaled and a portion will eventually become trapped within the small airways and alveolar regions of the lung.

A number of adverse short-term health effects have been associated with exposures to diesel exhaust. Occupational exposures to diesel exhaust particles have been associated with significant cross-shift decreases in lung function. Increased cough, labored breathing, chest tightness, and wheezing have been associated with exposure to diesel exhaust in bus garage workers. A significant increase in airway resistance and increases in eye and nasal irritation were observed in human volunteers following one-hour chamber exposure to diesel exhaust. In

acute or subchronic animal studies, exposure to diesel exhaust particles induced inflammatory airway changes, lung function changes, and increased the animals' susceptibility to infection.

A number of adverse long-term noncancer effects have been associated with exposure to diesel exhaust. Occupational studies have shown that there may be a greater incidence of cough, phlegm and chronic bronchitis among those exposed to diesel exhaust than among those not exposed. Reductions in pulmonary function have also been reported following occupational exposures in chronic studies. Exposure to diesel exhaust has also shown cellular changes in laboratory animals.

Over 30 human epidemiological studies have investigated the potential carcinogenicity of diesel exhaust. These studies, on average, found that long-term occupational exposures to diesel exhaust were associated with a 40 percent increase in the relative risk of lung cancer. The lung cancer findings are consistent and the association is unlikely to be due to chance. These epidemiological studies strongly suggest a causal relationship between occupational diesel exhaust exposure and lung cancer.

Acrolein. Acrolein is a powerful irritant. Due to its highly reactive nature, the effects of acrolein are generally limited to the site of contact; skin, eyes and mucous membranes. Inhalation exposure to low levels (≤ 1 ppm) causes irritation of the eyes, nose and throat. Acute exposures to levels above 1 ppm result in mucous hypersecretion and exacerbation of allergic airway response in animal models. Moderately higher exposures may result in severe lacrimation, and irritation of the mucous membranes of the respiratory tract. Death due to respiratory failure has been associated with high level exposures. Long term exposure to acrolein may result in structural and functional changes in the respiratory tract, including lesions in the nasal mucosa, and pulmonary inflammation.

1,3–Butadiene. Motor vehicle exhaust is a constant source of 1,3-butadiene. Although 1,3-butadiene breaks down quickly in the atmosphere, it is usually found in ambient air at low levels in urban and suburban areas. Acute (short-term) exposure to 1,3-butadiene by inhalation in humans results in irritation of the eyes, nasal passages, throat, and lungs. Epidemiological studies

have reported a possible association between 1,3-butadiene exposure and cardiovascular diseases. Epidemiological studies of workers in rubber plants have shown an association between 1,3-butadiene exposure and increased incidence of leukemia. Animal studies have reported tumors at various sites from 1,3-butadiene exposure. The USEPA has classified 1,3-butadiene as carcinogenic to humans by inhalation.

Naphthalene. Naphthalene is used in the production of phthalic anhydride; it is also used in mothballs. Acute (short-term) exposure of humans to naphthalene by inhalation, ingestion, and dermal contact is associated with hemolytic anemia, damage to the liver, and neurological damage. Cataracts have also been reported in workers acutely exposed to naphthalene by inhalation and ingestion. Chronic (long-term) exposure of workers and rodents to naphthalene has been reported to cause cataracts and damage to the retina. Hemolytic anemia has been reported in infants born to mothers who "sniffed" and ingested naphthalene (as mothballs) during pregnancy. Available data are inadequate to establish a causal relationship between exposure to naphthalene and cancer in humans. The USEPA has classified naphthalene as a Group C, possible human carcinogen. The state of California has classified naphthalene as a carcinogenic compound.

Polycyclic Organic Matter. The term polycyclic organic matter (POM) defines a broad class of compounds that includes the polycyclic aromatic hydrocarbon compounds (PAHs), of which benzo[a]pyrene is a member. POM compounds are formed primarily from combustion and are present in the atmosphere in particulate form. Sources of air emissions are diverse and include cigarette smoke, vehicle exhaust, home heating, laying tar, and grilling meat. Cancer is the major concern from exposure to POM. Epidemiologic studies have reported an increase in lung cancer in humans exposed to coke oven emissions, roofing tar emissions, and cigarette smoke; all of these mixtures contain POM compounds. Animal studies have reported respiratory tract tumors from inhalation exposure to benzo[a]pyrene and forestomach tumors, leukemia, and lung tumors from oral exposure to benzo[a]pyrene. The USEPA has classified seven PAHs (benzo[*a*]pyrene, benz[a]anthracene, chrysene, benzo[b]fluoranthene, benzo[k]fluoranthene, dibenz[a,h]anthracene, and indeno[1,2,3-cd]pyrene) as Group B2, probable human carcinogens.

Greenhouse gases (GHGs) are gases that trap heat in the atmosphere. These emissions occur from natural processes as well as human activities. The accumulation of GHGs in the atmosphere regulates the earth's temperature. Scientific evidence indicates a trend of increasing global temperature over the past century, which a number of scientists attribute to an increase in GHG emissions from human activities. The climate change associated with this global warming is predicted to produce negative economic and social consequences across the globe.

Recent observed changes due to global warming include shrinking glaciers, thawing permafrost, a lengthened growing season, and shifts in plant and animal ranges (Intergovernmental Panel on Climate Change 2007). Generally accepted predictions of long-term environmental impacts due to global warming include sea level rise, changing weather patterns with increases in the severity of storms and droughts, changes to local and regional ecosystems including the potential loss of species, and a significant reduction in winter snow pack.

The most common GHGs emitted from natural processes and human activities include carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Examples of GHGs created and emitted primarily through human activities include fluorinated gases (hydrofluorocarbons and perfluorocarbons) and sulfur hexafluoride. Each GHG is assigned a global warming potential. The global warming potential is the ability of a gas or aerosol to trap heat in the atmosphere. The global warming potential rating system is standardized to CO_2, which has a value of one. For example, CH_4 has a global warming potential of 21, which means that it has a global warming effect 21 times greater than CO_2 on an equal-mass basis. Total GHG emissions from a source are often reported as a CO_2 equivalent (CO_2e). The CO_2e is calculated by multiplying the emission of each GHG by its global warming potential and adding the results together to produce a single, combined emission rate representing all GHGs. On a national scale, federal agencies are addressing emissions of GHGs by reductions mandated in federal laws and Executive Orders, most recently, Executive Order 13423 Strengthening Federal Environmental, Energy, and Transportation Management (January 24, 2007) was enacted. Several states have promulgated laws as a means to reduce statewide levels of GHG emissions. In particular, the California

Global Warming Solutions Act of 2006 directs the State of California to reduce statewide GHG emissions to 1990 levels by the year 2020.

The potential effects of proposed GHG emissions are by nature global, and have cumulative impacts. As individual sources, GHG emissions are not large enough to have an appreciable effect on climate change. Therefore, the impact of proposed GHG emissions to climate change is discussed in the context of cumulative impacts.

Air quality in the air basin for the Project area is regulated by federal, state, and local regulatory agencies with the responsibility for maintaining ambient air quality within federal and state standards. The USEPA is the federal agency responsible for establishing air quality regulations on a federal level. The Federal Clean Air Act (CAA) and its subsequent amendments establish air quality regulations and the NAAQS and delegate the enforcement of these standards to the states. In California, the California Air Resources Board (ARB) is responsible for enforcing air pollution regulations. The ARB has in turn delegated the responsibility of regulating stationary emission sources to regional air agencies. In the air basin of the Project area, which is located in eastern Riverside County, the Mojave Desert Air Quality Management District (MDAQMD) has this responsibility.

The following sections summarize the air quality rules and regulations that apply to the Blythe Mesa Solar Project.

2.1 Federal Regulations

The Federal CAA applies to all air emission sources and to all areas within the United States. Regulations adopted under the CAA that would apply to the Blythe Mesa Solar Project would include the NAAQS, as well as other requirements that have been adopted as part of the MDAQMD's federally approved plans and programs.

As indicated in Federal Register Volume 75, No. 11, Page 2938, the USEPA is considering lowering the 8-hour O_3 standard from 0.075 ppm, which is its current level, to a lower level

within the range of 0.060 and 0.070 ppm. The lower level is proposed to provide increased protection for children and other "at risk" populations against O_3 health effects.

Recent actions by the USEPA have allowed for the regulation of greenhouse gases (GHGs). On April 17, 2009, USEPA issued its proposed endangerment finding for GHG emissions. On December 7, 2009, the USEPA Administrator signed and finalized two distinct findings regarding greenhouse gases under section 202(a) of the Clean Air Act:

> **Endangerment Finding:** The Administrator finds that the current and projected concentrations of the six key well-mixed greenhouse gases--carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6)--in the atmosphere threaten the public health and welfare of current and future generations.
>
> **Cause or Contribute Finding:** The Administrator finds that the combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution which threatens public health and welfare.

These findings do not themselves impose any requirements on industry or other entities. However, this action was a prerequisite to finalizing the USEPA's proposed greenhouse gas emission standards for light-duty vehicles, which were jointly proposed by USEPA and the Department of Transportation's National Highway Safety Administration on September 15, 2009 and adopted on April 1, 2010. As finalized in April 2010, the emissions standards rule for vehicles will improve average fuel economy standards to 35.5 miles per gallon by 2016. In addition, the rule will require model year 2016 vehicles to meet an estimated combined average emission level of 250 grams of carbon dioxide per mile.

On March 10, 2009, in response to the FY2008 Consolidated Appropriations Act (H.R. 2764; Public Law 110–161), the USEPA proposed a rule that requires mandatory reporting of greenhouse gas (GHG) emissions from large sources in the United States. On September 22, 2009, the Final Mandatory Reporting of Greenhouse Gases Rule was signed, and was published in the Federal Register on October 30, 2009. The rule became effective on December 29, 2009.

The rule will collect accurate and comprehensive emissions data to inform future policy decisions.

The USEPA is requiring suppliers of fossil fuels or industrial greenhouse gases, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to USEPA. The gases covered by the proposed rule are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), sulfur hexafluoride (SF_6), and other fluorinated gases, including nitrogen trifluoride (NF_3) and hydrofluorinated ethers (HFE).

2.2 State Regulations

The ARB has oversight over air quality in the state of California, and has established the California Clean Air Act (CCAA). The CCAA was signed into law in 1988 and, for the first time, clearly spelled out in statute California's air quality goals, planning mechanisms, regulatory strategies, and standards of progress. The CCAA provides the State with a comprehensive framework for air quality planning regulation. Prior to passage of the Act, federal law contained the only comprehensive planning framework. As part of its authority within the state of California, and as allowed under the Federal CAA, the ARB has established the California Ambient Air Quality Standards (CAAQS). The CAAQS are at least as stringent as the NAAQS. Both the NAAQS and CAAQS are shown in Table 1.

The ARB is responsible for the development of the State Implementation Plan (SIP), which provides a framework for attaining and maintaining the NAAQS within the state of California. In turn, development of individual inputs to the SIP is the responsibility of local air pollution control agencies. Regulation of individual stationary sources has been delegated to local air pollution control agencies.

The ARB is responsible for developing programs designed to reduce emissions from non-stationary sources, including motor vehicles and off-road equipment. The ARB and the California Office of Environmental Health Hazard Assessment (OEHHA) are also responsible for developing regulations governing TACs. TACs include air pollutants that can cause serious

illnesses or increased mortality, even in low concentrations. The ARB and OEHHA identify specific air pollutants as TACs, develop health thresholds for exposure to TACs, and develop guidelines for conducting health risk assessments for sources of TAC emissions.

The state of California enacted some of the first legislation in the United States to regulate GHGs. The following subsections describe regulations and standards that have been adopted by the state of California to address GHG emissions.

Assembly Bill 32, the California Global Warming Solutions Act of 2006. In September 2006, Governor Schwarzenegger signed AB 32 into law. AB 32 directs the ARB to do the following:

- Make publicly available a list of discrete early action GHG emission reduction measures that can be implemented prior to the adoption of the statewide GHG limit and the measures required to achieve compliance with the statewide limit.
- Make publicly available a GHG inventory for the year 1990 and determine target levels for 2020.
- On or before January 1, 2010, adopt regulations to implement the early action GHG emission reduction measures.
- On or before January 1, 2011, adopt quantifiable, verifiable, and enforceable emission reduction measures by regulation that will achieve the statewide GHG emissions limit by 2020, to become operative on January 1, 2012, at the latest. The emission reduction measures may include direct emission reduction measures, alternative compliance mechanisms, and potential monetary and non-monetary incentives that reduce GHG emissions from any sources or categories of sources that ARB finds necessary to achieve the statewide GHG emissions limit.
- Monitor compliance with and enforce any emission reduction measure adopted pursuant to AB 32.

AB 32 required that, by January 1, 2008, the ARB determine what the statewide GHG emissions level was in 1990, and approve a statewide GHG emissions limit that is equivalent to that level, to be achieved by 2020. The ARB adopted its Scoping Plan in December 2008, which provided

estimates of the 1990 GHG emissions level and identified sectors for the reduction of GHG emissions. The ARB has estimated that the 1990 GHG emissions level was 427 MMT net CO_2e (ARB 2007b). The ARB estimates that a reduction of 173 MMT net CO_2e emissions below business-as-usual would be required by 2020 to meet the 1990 levels (ARB 2007b). This amounts to roughly a 30 percent reduction from projected business-as-usual levels in 2020 (ARB 2008a).

Senate Bill 97. Senate Bill (SB) 97, enacted in 2007, amends the CEQA statute to clearly establish that GHG emissions and the effects of GHG emissions are appropriate subjects for CEQA analysis. SB 97 directed the Governor's Office of Planning and Research (OPR) to develop draft CEQA guidelines "for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions" by July 1, 2009, and directed the California Natural Resources Agency (CNRA) to certify and adopt the CEQA guidelines by January 1, 2010.

OPR published a technical advisory on CEQA and climate change on June 19, 2008. The guidance did not include a suggested threshold, but stated that the OPR had asked the ARB to "recommend a method for setting thresholds which will encourage consistency and uniformity in the CEQA analysis of greenhouse gas emissions throughout the state." The OPR technical advisory does recommend that CEQA analyses include the following components:

- Identification of greenhouse gas emissions;
- Determination of significance; and
- Mitigation of impacts, as needed and as feasible.

On December 31, 2009, the CNRA adopted the proposed amendments to the State CEQA Guidelines. These amendments became effective on March 18, 2010.

Executive Order S-3-05. Executive Order S-3-05, signed by Governor Schwarzenegger on June 1, 2005, calls for a reduction in GHG emissions to 1990 levels by 2020 and for an 80 percent reduction in GHG emissions below 1990 levels by 2050. Executive Order S-3-05 also calls for the California EPA (CalEPA) to prepare biennial science reports on the potential impact of continued GCC on certain sectors of the California economy. The first of these reports, "Our

Changing Climate: Assessing Risks to California", and its supporting document "Scenarios of Climate Change in California: An Overview" were published by the California Climate Change Center in 2006.

Executive Order S-21-09. Executive Order S-21-09 was enacted by the Governor on September 15, 2009. Executive Order S-21-09 requires that the ARB, under its AB 32 authority, adopt a regulation by July 31, 2010 that sets a 33 percent renewable energy target. Under Executive Order S-21-09, the ARB will work with the Public Utilities Commission and California Energy Commission to encourage the creation and use of renewable energy sources, and will regulate all California utilities. The ARB will also consult with the Independent System Operator and other load balancing authorities on the impacts on reliability, renewable integration requirements, and interactions with wholesale power markets in carrying out the provisions of the Executive Order. The order requires the ARB to establish highest priority for those resources that provide the greatest environmental benefits with the least environmental costs and impacts on public health.

California Code of Regulations Title 24. Although not originally intended to reduce greenhouse gas emissions, Title 24 of the California Code of Regulations, Part 6: California's Energy Efficiency Standards for Residential and Nonresidential Buildings, were first established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow for the consideration and possible incorporation of new energy efficiency technologies and methods. Energy efficient buildings require less electricity, natural gas, and other fuels. Electricity production from fossil fuels and on-site fuel combustion (typically for water heating) results in greenhouse gas emissions. Therefore, increased energy efficiency results in decreased greenhouse gas emissions.

The GHG emission inventory was based on Title 24 standards as of October 2005; however, Title 24 has been updated as of 2008 and standards are currently being phased in.

Senate Bill 1078, Senate Bill 107, and Executive Order S-14-08. SB 1078 initially set a target of 20% of energy to be sold from renewable sources by the year 2017. The schedule for

implementation of the RPS was accelerated in 2006 with the Governor's signing of SB 107, which accelerated the 20% RPS goal from 2017 to 2010. On November 17, 2008, the Governor signed Executive Order S-14-08, which requires all retail sellers of electricity to serve 33 percent of their load with renewable energy by 2020. The Governor signed Executive Order S-21-09 on September 15, 2009, which directs ARB to implement a regulation consistent with the 2020 33% renewable energy target by July 31, 2010.

State Standards Addressing Vehicular Emissions. California Assembly Bill 1493 (Pavley) enacted on July 22, 2002, required the ARB to develop and adopt regulations that reduce greenhouse gases emitted by passenger vehicles and light duty trucks. Regulations adopted by ARB would apply to 2009 and later model year vehicles. ARB estimated that the regulation would reduce climate change emissions from light duty passenger vehicle fleet by an estimated 18% in 2020 and by 27% in 2030 (AEP 2007). Overall within the state of California, implementation of the Pavley standards are anticipated to reduce GHG emissions by 17.23% (ARB 2011).

The ARB has adopted amendments to the Pavley regulations that reduce GHG emissions in new passenger vehicles from 2009 through 2016. The amendments, approved by the ARB Board on September 24, 2009, are part of California's commitment toward a nation-wide program to reduce new passenger vehicle GHGs from 2012 through 2016, and prepare California to harmonize its rules with the federal rules for passenger vehicles.

Executive Order S-01-07. Executive Order S-01-07 was enacted by the Governor on January 18, 2007, and mandates that: 1) a statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020; and 2) a Low Carbon Fuel Standard ("LCFS") for transportation fuels be established for California. On April 23, 2009, the ARB adopted regulations to implement the LCFS.

Senate Bill 375. SB 375 finds that GHG from autos and light trucks can be substantially reduced by new vehicle technology, but even so "it will be necessary to achieve significant additional greenhouse gas reductions from changed land use patterns and improved

transportation. Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32." Therefore, SB 375 requires that regions with metropolitan planning organizations adopt sustainable communities strategies, as part of their regional transportation plans, which are designed to achieve certain goals for the reduction of GHG emissions from mobile sources.

SB 375 also includes CEQA streamlining provisions for "transit priority projects" that are consistent with an adopted sustainable communities strategy. As defined in SB 375, a "transit priority project" shall: (1) contain at least 50 percent residential use, based on total building square footage and, if the project contains between 26 and 50 percent nonresidential uses, a floor area ratio of not less than 0.75; (2) provide a maximum net density of at least 20 dwelling units per acre; and (3) be within 0.5 mile of a major transit stop or high quality transit corridor.

Table 1
National Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards	NATIONAL STANDARDS [a]	
			Primary [b,c]	Secondary [b,d]
Ozone (O_3)	8-hour	0.070 ppm (137 µg/m^3)	0.075 ppm (147 µg/m^3)	Same as primary
	1-hour	0.09 ppm (180 µg/m^3)	—	—
Carbon monoxide (CO)	8-hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	—
	1-hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	—
Nitrogen dioxide (NO_2)	Annual	0.030 ppm (56 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as primary
	1-hour	0.18 ppm (338 µg/m^3)	0.100 ppm (188 µg/m^3)	—
Sulfur dioxide (SO_2)	24-hour	0.04 ppm (105 µg/m^3)	—	—
	3-hour	—	—	0.5 ppm (1,300 µg/m^3)
	1-hour	0.25 ppm (655 µg/m^3)	0.075 ppm (196 µg/m^3)	—
PM_{10}	Annual	20 µg/m^3	—	—
	24-hour	50 µg/m^3	150 µg/m^3	Same as primary
$PM_{2.5}$	Annual	12 µg/m^3	12.0 µg/m^3	
	24-hour	—	35 µg/m^3	
Lead	Rolling 3-month period	—	0.15 µg/m^3	Same as primary
	Calendar Quarter	—	1.5 µg/m^3	Same as primary
	30-day average	1.5 µg/m^3	—	—
Hydrogen Sulfide	1-hour	0.03 ppm (42 µg/m^3)	—	—

Notes:

(a) Standards other than the 1-hour ozone, 24-hour PM_{10}, 24-hour $PM_{2.5}$, and those based on annual averages are not to be exceeded more than once a year. The 8-hour ozone national standard has replaced the 1-hour ozone national standard.

(b) Concentrations are expressed first in units in which they were promulgated. Equivalent units given in parenthesis.

(c) Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health. Each state must attain the primary standards no later than 3 years after that state's implementation plan is approved by the USEPA.

(d) Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

2.3 Local Regulations

As discussed above, the Blythe Mesa Solar Project is located in the jurisdiction of the MDAQMD. The MDAQMD is responsible for regulating stationary sources of air emissions in the air basin of the Project area. Stationary sources that have the potential to emit air pollutants into the ambient air are subject to the Rules and Regulations adopted by the MDAQMD. The following MDAQMD rules are applicable to the project.

Rule 401 – Visible Emissions. Rule 401 states that a person shall not discharge into the atmosphere, from any single source of emissions whatsoever, any air contaminant for a period or periods aggregating more than three minutes in any one hour which is:

(a) As dark or darker in shade as that designated as No. 1 on the Ringelmann Chart, as published by the U.S. Bureau of Mines, or
(b) Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described in Subsection A [of the Rules].

Rule 402 - Nuisance. Rule 402 prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Rule 403 – Fugitive Dust. Rule 403 requires control of fugitive dust emissions during activities such as construction that have the potential to generate dust. The provisions of Rule 403 include the following:

(a) A person shall not cause or allow the emissions of fugitive dust from any transport, handling, construction or storage activity so that the presence of such dust remains visible in the atmosphere beyond the property line of the emission source. (Does not apply to emissions emanating from unpaved roadways open to public travel or farm roads. This exclusion shall not apply to industrial or commercial facilities).
(b) A person shall take every reasonable precaution to minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land and solid waste disposal operations.
(c) A person shall not cause or allow particulate matter to exceed 100 micrograms per cubic meter when determined as the difference between upwind and downwind samples collected on high volume samplers at the property line for a minimum of five hours.
(d) A person shall take every reasonable precaution to prevent visible particulate matter from being deposited upon public roadways as a direct result of their operations. Reasonable precautions shall include, but are not limited to, the removal of particulate matter from equipment prior to movement on paved streets or the prompt removal of any material from paved streets onto which such material has been deposited.

(e) Subsections (a) and (c) shall not be applicable when the wind speed instantaneously exceeds 40 kilometers (25 miles) per hour, or when the average wind speed is greater than 24 kilometers (15 miles) per hour. The average wind speed determination shall be on a 15 minute average at the nearest official air-monitoring station or by wind instrument located at the site being checked.
(f) The provisions of this rule shall not apply to agricultural operations.

Rule 404 – Particulate Matter Concentration. Rule 404 restricts emissions of particulate matter from any source based on the concentrations specified in Table 404(a).

Rule 405 – Solid Particulate Matter Weight. Rule 405 restricts emissions of particulate matter from any source based on the concentrations specified in Table 405(a).

Rule 406 – Specific Contaminants. Rule 406 restricts emissions of sulfur compounds to 500 ppmv or less, and restricts emissions of halogens, which are not generally emitted from construction projects.

Rule 407 – Liquid and Gaseous Air Contaminants. Rule 407 restricts emissions of carbon monoxide to 2000 ppm or less.

Rule 408 – Circumvention. Rule 408 restricts the building, erection, installation or use of any equipment, the use of which, without resulting in a reduction in the total release of air contaminants to the atmosphere, reduces or conceals an emission which would otherwise constitute a violation of Chapter 3 (commencing with Section 41700) of Part 4, of Division 26 of the Health and Safety Code or of the MDAQMD Rules.

Rule 409 – Combustion Contaminants. Rule 409 restricts discharge into the atmosphere from the burning of fuel, combustion contaminants exceeding 0.23 gram per cubic meter (0.1 grain per cubic foot) of gas calculated to 12 percent of carbon dioxide (CO2) at standard conditions averaged over a minimum of 25 consecutive minutes.

Rule 431 – Sulfur Content of Fuels. Rule 431 restricts the use of any gaseous fuel containing sulfur compounds in excess of 800 ppm calculated as hydrogen sulfide at standard conditions, or any liquid or solid fuel having a sulfur content in excess of 0.5 percent by weight.

Rule 442 – Usage of Solvents. Rule 442 restricts the emission of VOCs from any solvent material to 1,190 pounds per month, and requires proper storage and handling of VOC-containing solvents.

To date, the MDAQMD has not enacted regulations governing GHGs.

3.0 Environmental Setting

As discussed in Section 1.2, the Project is proposed to be located on approximately 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587 for the solar field and 73 acres for the 230 kilovolt (kV) transmission line interconnect. The site is located in proximity to rural

agricultural lands, undeveloped lands, uses associated with the Blythe Airport, power generation, local roads, and interstate highway and other non-sensitive uses.

Sensitive receptors are people who are considered to be more sensitive than others to air pollutants. The reasons for greater than average sensitivity include pre-existing health problems, proximity to emissions sources, or duration of exposure to air pollutants. Schools, hospitals, and convalescent homes are considered to be sensitive to poor air quality because children, elderly people, and the infirmed are more susceptible to respiratory distress and other air quality-related health problems than the general public. Residential areas are considered sensitive to poor air quality because people usually stay home for extended periods of time, with associated greater exposure to ambient air quality. Recreational uses may also be considered sensitive due to the greater exposure to ambient air quality conditions because vigorous exercise associated with recreation places a high demand on the human respiratory system.

Sensitive air quality receptors (e.g., local residences, schools, hospitals, churches, and recreational facilities) are located within one mile of the project site, including several residences. There are 369 residences within one mile of the project site, of which eight individual residences are located within 1,000 feet of the site. The closest residence is located approximately 260 feet away. In addition, the project is approximately 0.4 miles (2,200 feet) from the Mesa Verde Park and approximately 0.8 miles (4,400 feet) from the Roy Wilson Community and Child Center. No schools, hospitals, or convalescent homes are located within one mile of the proposed project.

Areas that do not meet the NAAQS or CAAQS for a given criteria pollutant are designated as "nonattainment areas" by the USEPA and/or the ARB. Further classifications are given to nonattainment areas to identify the severity and number of violations experienced, and the year in which attainment is anticipated based on implementation of attainment plans. The Project area is located in a portion of the air basin considered an unclassified/attainment area for all of the NAAQS. The air basin of the Project area is considered a moderate nonattainment area for the CAAQS for O_3 and a nonattainment area for the CAAQS for PM_{10}. The air basin of the Project area is considered unclassified/attainment for all CAAQS for the other criteria pollutants.

3.1 Regional Climate

The project area is located in eastern California in the Colorado Desert. The Colorado Desert ranges in elevation from 2,000 feet above sea level to 5,000 feet above sea level. The climate in the Blythe area is categorized as a high desert climate, with dry, hot summers and cool winters. The region is characterized by extreme fluctuations of daily temperatures, strong seasonal winds, and clear skies. January is the coldest month, with a mean low temperature of 37.4°F. July is the hottest month, with a mean high temperature of 108.4°F.

In late winter and early spring the wind is a prominent feature, with dry winds blowing in the afternoon and evening. Winds in excess of 25 mph, with gusts of 75 mph or more are not uncommon. Although it is windy during all months, November, December and January are the calmest. The humidity is below 40% most of the year. During most winter nights, and during and after summer rains the humidity can get above 50%.

The Colorado Desert lies in the rainshadow of the Coast Ranges and receives an average annual precipitation of 5 inches. Most of the precipitation occurs between November and April. There is, however, a summer thunderstorm season from July to September with violent and heavy rainstorms possible.

Data from the Western Regional Climate Center (WRCC 2010) indicate that temperature and precipitation data were measured at Blythe from January 1913 through the present. The mean temperature for the Blythe station is 71.6°F, and the mean annual precipitation is 3.80 inches. Monthly average temperatures and precipitation for the area are summarized in Table 2.

Table 2 Monthly Average Temperatures and Precipitation Blythe Meteorological Station				
Month	**Monthly Average Temperatures, °F**			**Precipitation, inches**
	Maximum	**Minimum**	**Mean**	**Mean**
January	67.6	37.4	52.5	0.51
February	73.0	41.8	57.4	0.46
March	79.4	46.5	57.4	0.34
April	87.4	52.7	70.0	0.12
May	95.5	59.9	77.7	0.03

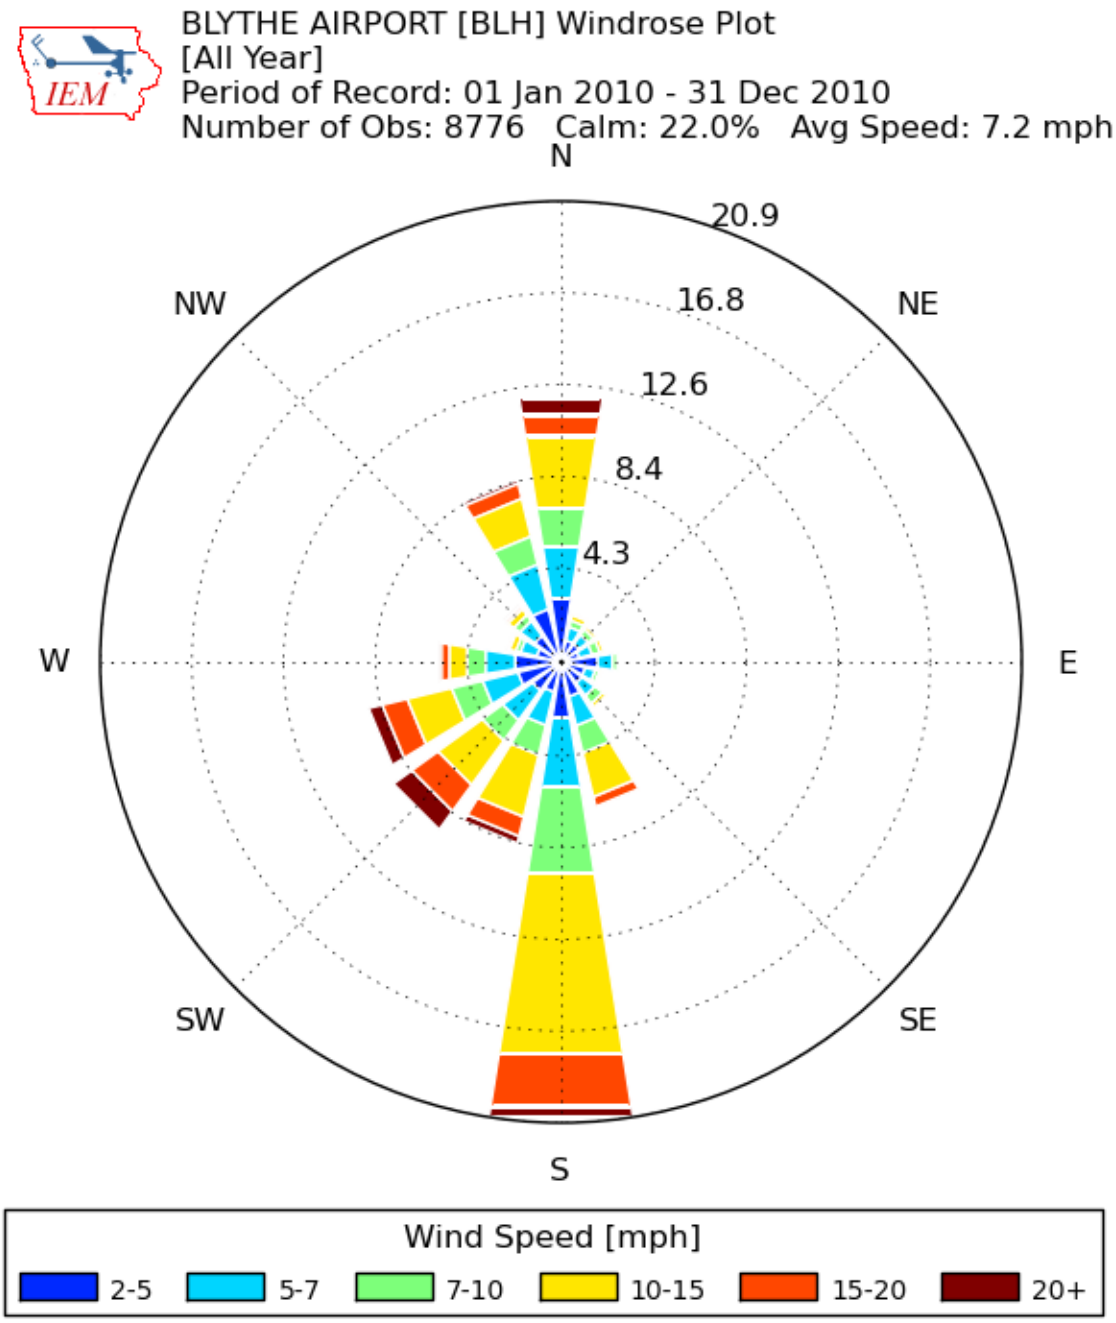

Figure 3. Blythe Wind Rose

3.2 Existing Air Quality

The ARB and the MDAQMD operate a series of ambient air quality monitoring stations throughout the southern California. The closest monitoring site to the Blythe Mesa Solar Project is located at 445 West Murphy Street in Blythe. The Blythe monitoring station measures O_3. The nearest monitoring station that measures $PM_{2.5}$ is located in Victorville; measurements in Victorville are not likely to be representative of conditions in the Project area. The nearest monitoring station that measures CO, NO_2, and PM_{10} is located at Barstow, which may also be substantially different from conditions in Blythe. Data from this station are shown below for informational purposes. Table 3 provides a summary of background air quality representative of the Project region.

Table 3
Representative Air Quality Data for the Blythe Mesa Solar Project Area (2006-2011)

Air Quality Indicator	2006	2007	2008	2009	2010	2011
Ozone (O_3) [1,3]						
Peak 1-hour value (ppm)	0.073	0.092	0.074	0.072	0.072	0.066
Days above state standard (0.09 ppm)	0	0	0	0	0	0
Peak 8-hour value (ppm)	0.059	0.075	0.071	0.066	0.067	0.061
Days above state standard (0.070 ppm)	0	1	1	0	0	0
Days above federal standard (0.075 ppm) [1,2]	0	0	0	0	0	0
Particulate matter less than or equal to 10 microns in diameter (PM_{10}) [4]						
Peak 24-hour value ($\mu g/m^3$)	80	202	93	76	38	108
Days above state standard (50 $\mu g/m^3$)	2	5	2	2	0	2
Days above federal standard (150 $\mu g/m^3$)	0	1	0	0	0	0
Annual Arithmetic Mean (ppm)	21.9	29.8	26.1	26.8	18.8	21.5
Carbon Monoxide [4]						
Peak 8-hour value ($\mu g/m^3$)	1.19	0.70	1.23	0.89	0.89	1.35
Days above federal standard (9 ppm)	0	0	0	0	0	0
Peak 8-hour value ($\mu g/m^3$)	3.5	1.4	1.4	1.2	1.1	4.3
Days above state standard (20 ppm)	0	0	0	0	0	0
Days above federal standard (35 ppm)	0	0	0	0	0	0
Nitrogen Dioxide (NO_2) [4]						
Peak 1-hour value (ppm)	0.082	0.073	0.081	0.060	0.062	0.077
Days above state standard (0.18 ppm)	0	0	0	0	0	0
Annual Arithmetic Mean (ppm)	0.022	0.020	0.019	0.016	0.017	0.017

Notes: [1] The federal O_3 standard was revised downward in 2008 to 0.075 ppm.
[2] The federal eight-hour ozone standard was previously defined as 0.08 ppm (1 significant digit). Measurements were rounded up or down to determine compliance with the standard; therefore a measurement of 0.084 ppm is rounded to 0.08 ppm. The 8-hour ozone ambient air quality standards are met at an ambient air quality monitoring site when the average of the annual fourth-highest daily maximum 8-hour average ozone concentration is less than or equal to the standard.
[3] Data from the Blythe monitoring station. Data for 1-hour CO concentrations unavailable.
[4] Data from the Barstow monitoring station.

ppm = parts per million; $\mu g/m^3$ = micrograms per cubic meter; * = not available

4.0 Impact Assessment

4.1 Significance Thresholds

The CEQA thresholds of significance for air quality are derived from Appendix G of the state CEQA guidelines. These thresholds indicate that a project could have potentially significant impacts if it could:

a. Conflict with or obstruct implementation of the applicable air quality plan
b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation
c. Result in cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including release emissions which exceed quantitative thresholds for ozone precursors);
d. Expose sensitive receptors to substantial pollutant concentrations; or
e. Create objectionable odors affecting a substantial number of people.

The MDAQMD has adopted CEQA Guidelines (MDAQMD 2009) based on the State CEQA Guidelines that indicate that a project would have a significant impact on air quality if it will:

1. Generates total emissions (direct and indirect) in excess of the thresholds given in Table 4 below; and/or,
2. Generates a violation of any ambient air quality standard when added to the local background; and/or,
3. Does not conform with the applicable attainment or maintenance plan(s); and/or,
4. Exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index (HI) (non-cancerous) greater than or equal to 1.

As defined in the MDAQMD's CEQA Guidelines, sensitive receptors include residences, schools, daycare centers, playgrounds and medical facilities are considered sensitive receptor land uses. The following project types proposed for sites within the specified distance to an existing or planned (zoned) sensitive receptor land use must be evaluated using significance threshold criterion number 4:

- Any industrial project within 1000 feet;
- A distribution center (40 or more trucks per day) within 1000 feet;
- A major transportation project (50,000 or more vehicles per day) within 1000 feet;
- A dry cleaner using perchloroethylene within 500 feet;
- A gasoline dispensing facility within 300 feet.

Table 4 presents the quantitative thresholds by which a project's emissions are evaluated under significance threshold criterion number 1. The air quality impacts associated with the project were evaluated for significance based on these significance criteria.

Table 4
MDAQMD Significant Emission Thresholds

Criteria Pollutant	Annual Threshold (tons)	Daily Threshold (pounds)
Carbon Monoxide (CO)	100	548
Oxides of Nitrogen (NOx)	25	137
Volatile Organic Compounds (VOCs)	25	137
Oxides of Sulfur (SOx)	25	137
Particulate Matter (PM_{10})	15	82
Particulate Matter ($PM_{2.5}$)	15	82
Hydrogen Sulfide (H_2S)	10	54
Lead (Pb)	0.6	3

In addition to air quality impacts, this analysis addresses impacts associated with greenhouse gas emissions. The effects of project-specific greenhouse gas (GHG) emissions are cumulative, and therefore global climate change impacts are addressed as a cumulative, rather than a direct, impact. The guidance for determining significance of impacts has been developed from the requirements of AB 32. The guideline addresses the potential cumulative impacts that a project's GHG emissions could have on global climate change. Based on Appendix G of the CEQA Guidelines, the following criteria are used to evaluate whether a project would result in a significant impact for global climate change impacts:

Would the project:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

As discussed in Section 15064.4 of the CEQA Regulations, the determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:

(1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use. The lead agency has discretion to select the model or methodology it considers most appropriate provided it supports its decision with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use; and/or

(2) Rely on a qualitative analysis or performance based standards.

A lead agency should consider the following factors, among others, when assessing the significance of impacts from greenhouse gas emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are

still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

Different agencies and studies estimate different goals for reduction of emissions to achieve 1990 levels by the year 2020, as set forth in AB 32. CAPCOA has suggested a screening-level significance threshold of 900 metric tons of CO_2-equivalent (CO_2e) emissions annually (CAPCOA 2008).

Impacts from GHG emissions were therefore evaluated based on a significance threshold of 900 metric tons of CO_2e as a screening threshold.

4.2 Impacts – Alternative 1

4.2.1 Construction Impacts – Alternative 1

Site Preparation

Since most of the site has nearly level to gently sloping topography, no mass grading would be required. Some of the parcels where facilities and arrays are located would require light grubbing for leveling and trenching. Access roads would require minimal grading. After grubbing and light grading, construction of staging areas would occur. On-site pre-assembly of trackers would take place in the assembly area.

The PV system proposed for the site can operate on slopes up to nine percent in all directions. Fine grading would only be required for the development of site access roads or to reduce extreme elevation areas. In order to aim for balanced cut-and-fill quantities, grading activities may include placement and compaction of excess materials in low-elevation areas of the site.

Minor demolition of existing site structures (e.g., storage buildings in citrus grove) is required.

Installation of the electrical collection system would require excavations to a depth of about three feet for underground electrical circuits, inverter and switchgear enclosure foundations, and

transformer foundation. The O&M building foundation would also be excavated to a depth of about three feet.

Construction Activities

The Project would be constructed in the following phases, which will occur simultaneously on different portions of the site:

- Development of staging areas and assembly areas, and grading of site access roads.
- Construction of arrays including the pile installation, the assembly of trackers, the mounting of PV panels, and trenching and installation of electrical equipment for arrays.
- Construction of electrical transmission facilities including the construction of three substation, double-circuit transmission line, and two O&M buildings.

Staging Areas, Assembly Areas, and Access Roads

Construction staging and material lay-down would be distributed across the project site evenly to allow for efficient distribution of components to different parts of the project. One staging and material lay-down area is typically set up for every 100 acres of a project site. These lay-down areas would be fenced and cover approximately five acres each. Lay-down areas would be temporary and would be converted to solar arrays as work is completed in the general area. Within the solar field, 12 foot wide access road would also be constructed approximately every 200 to 400 feet to allow access and maintenance of the solar panels.

Array Assembly

Tracker assembly may include up to 25 small gas-powered generators to power welding machines to assemble trackers and construct tracker arrays. Support piles up would be driven into the ground to a depth of eight to twelve feet using a vibration technology to reduce noise impacts. Torque tubes, electrical wire trays, and panels would then be installed on the piles. Concrete foundations for the drive motors would be poured in place, and electrical equipment for the array would be set in place. A tracked backhoe would drive piles. No blasting or rock breaking is anticipated or proposed. Small truck-mounted cranes or grade-all forklifts would

place trackers on support tiles. Tracker installation would include small all-terrain vehicles to transport materials and workers on access roads and array aisles.

Substations

Construction of the substations would involve site preparation, clearing of the switchyard site, and installation of substructures and electrical equipment. The site would be initially cleared, graded, and security fenced for the duration of substation construction. Underground Service Alert would be contacted to mark the locations of existing buried utilities in the vicinity. Substation materials and equipment would be delivered to, and stored at, the substation site, as required, during construction. The site would be graded to maintain current drainage patters as much as possible.

The substation would be constructed with conventional grading and construction equipment. Grading would establish the desired site grade, and minor excavation would provide concrete footings for the substation equipment. The substation site would be graveled with crushed rock for grounding and employee safety purposes.

O&M Buildings

The O&M building area would be surveyed and staked. A concrete slab would be poured to the dimensions of the building. The prefabricated steel building structure would then be assembled. The exterior finished would be constructed as the mechanical and electrical systems are built inside. Interior finishing would follow, and final fixtures and equipment would be installed.

Transmission Line

The transmission line construction will involve the following activities: (1) construction of staging areas for trailers, office personnel, equipment, material staging, lay-down and employee parking; (2) construction of access roads to the structure locations; (3) pole erection; (4) conductor installation; (5) tension and pulling sites of conductors; and (6) installation of overhead ground/fiber optic communications system.

Construction Sequence, Equipment, and Workforce

Construction is anticipated to occur over a three-year period with the construction phases (described above) occurring simultaneously. The solar field would be developed in six-month phases, with six blocks constructed at a time (each block 100 acres or a total of 600 acres at a time). As the arrays are being assembled, construction of the substations, transmission line, switchyard, and O&M buildings would also occur simultaneously. The timing and workforce used for each construction activity/phase is illustrated in Table 3. After the common facilities (e.g., substations, switchyards, O&M buildings) are completed in the earlier stages, the workforce would be devoted more to array construction in the later stages.

Approximately 300-500 daily workers would be present on site during construction. Workers would gain primary access to the site using Seeley Avenue and Riverside Drive off of Neighbors Blvd. Worker construction traffic would consist of up to 400daily vehicle roundtrips. It is anticipated that most workers would be drawn from the Blythe/Palo Verde Valley region and the Desert Center region, with a smaller portion drawn from the Imperial Valley or Eastern Riverside County region. Anticipated average daily material deliveries would consist of 20 truck deliveries per day for 24 months. Workers and delivery trucks will access site using the Neighbors Blvd. off ramp off Highway 10. On-site work hours would be from 7:00 a.m. to 7:00 p.m. During the installation period, construction workers are projected to be onsite five days per week, year round. Due to weather or other major type delays, times may shift to start as early as 5:00 a.m. and end as late as 8:00 p.m., as well as continue into the weekends. Security will be onsite 24 hours per day.

Table 5
Construction Phasing and Workforce Estimates

CONSTRUCTION ACTIVITY/PHASE*	DURATION	WORKERS
Site Preparation/Clearing/Grading	6 months	20
Staging & Assembly Areas (including access roads)	6 months	20
Construction of Solar Array, Substations, O&M Buildings	24 months	200-400
Installation of 230 kV Transmission Line & Fiber Optic Cable	12 months	30
Testing	3 months	20
Clean up/restoration	1 month	20

*Construction would occur over a three-year period with construction activities staggered.

During construction, a variety of equipment and vehicles would be operating on the site. Table 6 provides a list of the type and number of equipment and vehicles expected to construct each construction phase.

Table 6
Construction Equipment by Construction Phase

	CONSTRUCTION PHASES					
EQUIPMENT	**Site Preparation**	**Construction of Solar Array**	**Installation of Transmission Line Poles**	**Fiber Optic Cable**	**Substation & O&M Building**	**Clean up & Restoration**
Backhoe		X	X		X	
Cranes		X	X	X	X

Concrete Truck	X	X	X			
Flatbed Truck		X	X	X	X	
Light-weight Truck	X	X	X	X	X	
ATV Gator Carts	X	X			X	

The assumptions used to calculate construction emissions are as follows:

- Heavy construction equipment would be similar to other similar projects for site preparation, installation of the solar array, construction of the transmission line, and construction of the substation and O&M buildings.
- It was assumed that watering three times daily would control emissions of PM_{10} and $PM_{2.5}$ by 75 percent (based on the Midwest Research Institute's evaluation of fugitive

dust control measures, considering the application of water and dust suppressants on unpaved surfaces, control of stockpiles using water, use of enclosures and minimum freeboard on trucks, and limiting vehicles speeds on unpaved roadways).

- For the purpose of estimating maximum daily traffic, it was assumed that the maximum number of employees (500) could arrive in a single day. For conservative purposes,it was assumed that carpooling would reduce the total number of daily round trips to 400. It was also assumed that 20 truck trips could occur in a single day.
- Workers and trucks would travel, on average, 40 miles round trip per day.

Emissions of ROG, SOx, and GHGs from heavy equipment used in construction of the Blythe Mesa Solar Project were estimated based on emission factors for the SCAB from the ARB's OFFROAD2007 Model (ARB 2007a), as published on the SCAQMD's website. Emissions of NOx, CO, and PM were calculated based on the assumption that the equipment used for construction would, at a minimum, meet USEPA Tier 2 emission standards. Emission factors for 2012 represent the average fleet emissions throughout the SCAB and were considered representative of construction equipment that would be used during construction of the project. Emissions from worker travel and truck traffic were calculated using the ARB's EMFAC2007 Model (ARB 2007b) for on-road vehicles. Emissions of fugitive dust were estimated based on SCAQMD and USEPA emission factors. Unmitigated construction emissions may have the potential to result in a temporary significant impact on the air quality. Under the MDAQMD Rules and Regulations, all projects must comply with Rule 403, which prohibits fugitive dust from construction activities that results in emissions that are visible in the atmosphere beyond the property line where construction is occurring. Through the implementation of Rule 403, fugitive dust control measures must be utilized to reduce emissions of particulate matter during construction, and emissions from construction would therefore not conflict with or obstruct implementation of the applicable air quality management plan, and will be mitigated to below a level of significance.

Solar Array, O&M Buildings, Substation, and Transmission Line. Construction of these portions of the project would occur on site. The project also includes construction of an 8.4-mile transmission line to connect with the grid. Emissions were estimated based on the construction

schedule and equipment requirements for the project provided by the project team. Table 7 presents a summary of the daily construction emissions for the construction of the solar array, O&M buildings, substation, and transmission line based on the above assumptions and assuming standard mitigation measures would be implemented, in comparison with the MDAQMD significance thresholds.

Table 7
Estimated Construction Emissions – Solar Arrays, O&M Buildings, Substation and Transmission Line
Blythe Mesa Solar Project

Emission Source	ROG	NOx	CO	SOx	PM_{10}	$PM_{2.5}$
Maximum Daily Construction Emissions, lbs/day						
Offroad Equipment	35.35	99.36	63.31	12.81	4.61	4.10
On-Road Vehicles	19.10	33.84	207.51	0.02	4.04	4.00
Fugitive Dust	---	---	---	---	41.82	8.78
TOTAL	**54.45**	**133.20**	**270.82**	**12.83**	**50.47**	**16.88**
Significance Thresholds	137	137	548	137	82	82
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*
Annual Construction Emissions, tons/year						
Offroad Equipment	1.71	13.90	8.61	0.39	0.62	0.55
On-Road Vehicles	2.41	4.54	25.97	0.00	0.52	0.51
Fugitive Dust	---	---	---	---	5.02	0.96
TOTAL	**4.12**	**18.44**	**34.58**	**0.39**	**6.16**	**2.02**
Significance Thresholds	25	25	100	25	15	15
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*

As shown in Table 7, maximum daily emissions from construction of the solar array, O&M buildings, and substation would be below the significance thresholds for the maximum daily construction for all pollutants. Annual emissions would also be below the significance thresholds for all pollutants. Construction would therefore result in a less than significant impact on air quality.

Mitigation measures include fugitive dust control measures as required under MDAQMD Rule 403. Additional measures to reduce emissions during construction include the following:

Mitigation Measure AQ-1: Employ the following measures to reduce emissions from construction equipment and fugitive dust generating activities, as feasible.

- Require off-road construction equipment to meet or exceed Tier 3 standards with available CARB verified technologies, or
- Alternatively, require the use of alternative fueled off-road construction equipment, and
- Reroute construction trucks away from congested streets or sensitive receptor areas.
- Operating equipment in an idling mode shall be minimized not idle for more than five minutes. All equipment should be turned off when not in use, to the extent feasible.
- Minimize obstruction of through-traffic lanes. When feasible, construction should be planned so that lane closures on existing streets are kept to a minimum. If necessary, a flag person shall be retained to maintain the safety adjacent to existing roadways. Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.
- Dedicated turn lanes and/or other roadway improvements shall be provided as appropriate at heavily congested roadways.
- Require the application of non-toxic soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for ten days or more),
- Install wheel washers where vehicles enter and exit the construction site onto paved roads or wash off trucks and any equipment leaving the site,
- Require all trucks hauling dirt, sand, soil, or other loose materials to be covered,
- Suspend all excavating and grading operations when wind gusts (as instantaneous gusts) exceed 25 mph,
- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity including resolution of issues related to PM_{10} generation,
- When sweeping streets to remove visible soil materials use certified street sweepers or roadway washing trucks, and
- Replace ground cover in disturbed areas as quickly as possible.
- Construct or build with materials that do not require painting, and
- Require the use of pre-painted construction materials.

These construction mitigation measures will reduce emissions from construction. Impacts will be less than significant.

4.2.2 Operational Emissions – Alternative 1

Operations and maintenance include general operational activities in support of the site, as well as periodic washing of the solar panels. After the construction phase, the O&M building would serve the Project's approximately 12 permanent full-time employees, which would include one plant manager, five engineers/technicians, and six security staff. Project facilities would be monitored during operating (daylight) hours, even though the Project facilities would be capable of automatic start up, shutdown, self-diagnosis, and fault detection. The panels may be cleaned up to two times per year, if necessary to optimize output. No heavy equipment would be used during normal operation. O&M vehicles would include trucks (pickup and flatbed), forklifts, and loaders for routine and unscheduled maintenance and water trucks for solar panel washing. Large heavy-haul transport equipment may be brought to the project site infrequently for equipment repair or replacement. Fugitive dust would be generated from vehicles and equipment on unpaved surfaces.

Operational emissions would be confined to inspection and maintenance activities, including washing of the solar panels. Emissions associated with operations are summarized in Table 8.

Table 8
Estimated Operational Emissions
Blythe Mesa Solar Project

Emission Source	ROG	NOx	CO	SOx	PM_{10}	$PM_{2.5}$
Total Operational Emissions, lbs/day						
Offroad Equipment	10.99	37.59	19.95	1.32	1.15	1.02
On-Road Vehicles	3.25	9.48	36.90	0.00	0.38	0.38

Total Operational Emissions, tons/year						
Offroad Equipment	0.97	2.83	1.50	0.12	0.09	0.08
On-Road Vehicles	0.06	0.09	0.72	0.00	0.01	0.01
Fugitive Dust	---	---	---	---	0.20	0.03
TOTAL	**1.03**	**2.92**	**2.22**	**0.12**	**0.30**	**0.12**
Significance Thresholds	25	25	100	25	15	15
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*

As shown in Table 8, operational emissions would be below the maximum daily and annual

significance thresholds within the MDAQMD. Impacts from operations would therefore be less than significant.

4.2.3 Toxic Air Contaminant Emissions – Alternative 1

Construction activities would result in emissions of diesel particulate matter from heavy construction equipment used on site and truck traffic to and from the site, as well as minor amounts of TAC emissions from motor vehicles (such as benzene, 1,3-butadiene, toluene, and xylenes). Health effects attributable to exposure to diesel particulate matter are long-term effects based on chronic (i.e., long-term) exposure to emissions. Health effects are generally evaluated based on a lifetime (70 years) of exposure. As discussed in Section 4.1, a project would result in a significant impact if it exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index (HI) (non-cancerous) greater than or equal to 1.

The risk-driving TAC associated with construction activities at the Blythe Mesa project site is diesel particulate emitted from equipment and vehicles operating on site. Sources of diesel particulate matter at the site would include haul truck activities, heavy construction equipment, and contractor vehicles. Construction emissions were modeled using the SCREEN3 model to evaluate whether diesel particulate matter would result in a significant health risk to sensitive receptors in and adjacent to the Project area.

Based on the construction emissions analysis as shown in Table 7, the annual particulate emissions from offroad equipment operating on site would be 0.62 tons per year. The on-road diesel emissions would be 0.52 tons per year, which includes the 40-mile round trip distance traveling on roads to the site. For the purpose of providing a worst case analysis of the potential for TAC impacts to sensitive receptors, it was assumed that all of the on-road emissions could occur at the site.

The emissions were modeled using the SCREEN3 model as a volume source on the site, assuming the nearest off-site receptor would be located 100 meters from the site boundary.

Because SCREEN3 only provides maximum one-hour concentrations and excess cancer and chronic risks from diesel particulate matter are calculated on an annualized basis, the concentration predicted by the model was multiplied by the USEPA's recommended scaling factor of 0.08 to convert a 1-hour maximum concentration to an annual concentration.

The expected diesel construction emission concentrations from the SCREEN3 model are shown below in Table 9. Based upon the model results, the particulate matter concentrations are below the inhalation Chronic Risk Factor of 1.0 and the Cancer Risk Threshold of 10 in one million. There is no other substantial evidence in the record demonstrating that the Proposed Project would have a significant impact. Therefore, impacts for cancer risks from toxic air emissions during construction activities would be less than significant.

Table 9
Screening Health Risk Assessment Results

Diesel Particulate Matter Emissions (tons per year)	**1-hour Ground-Level Concentration, micrograms/cubic meter**	Annual **Ground-Level Concentration, micrograms/cubic meter**	**Calculated Cancer Risk (in a million)**	**Inhalation Chronic Risk Factor**	**Significant?**
1.14	0.4807	0.03846	0.549	0.00769	***No***

Notes:
1. SCREEN3 inputs were calculated by converting the diesel engine particulate matter emissions in tons per year for construction activities to grams per second per meters squared. The following conversion factors were utilized: 1 day = 86,400 seconds; 1 pound = 453.592 grams; 1 acre = 4,046.873 square meters
2. Pollutant concentrations based upon SCREEN3 modeling results.
3. The inhalation cancer risk was calculated based on the following equation:

Inhalation cancer risk = $((Cair*DBR*A*EF*ED*1x10^{-6})/AT)*$Inhalation Cancer Potency Factor)

Where

Cair = concentration in the air of DPM;
DBR = daily breathing rate (based on OEHHA guidance, assume 80th percentile breathing rate of 303 L/kg-day);
A = inhalation absorption factor (1);
EF = exposure frequency (365 days/year);
ED = duration of construction (3 years)
AT = average time period over which exposure is averaged (25,550 days);
Inhalation Cancer Potency Factor = 1.1 $(mg/kg\text{-}d)^{-1}$

4. The inhalation chronic risk was based upon the following equation:

Inhalation chronic risk = (Cair/Chronic Reference Exposure Level)

Where

Cair = concentration in the air of DPM;
Chronic Reference Exposure Level = Concentration level at which OEHHA has determined a significant chronic risk may result from inhalation exposure (5.0 $\mu g/m^3$)

4.2.4 Consistency with Ambient Air Quality Plans – Alternative 1

The MDAQMD's most recently adopted air quality management plan is its 2004 Ozone Attainment Plan (MDAQMD 2004). The MDAQMD has adopted the control measures recommended in the plan in its Rules and Regulations. The MDAQMD has also adopted fugitive dust control requirements in its Rule 403. Because the project will comply with the MDAQMD's Rules and Regulations, including those adopted from the SIP, the project will not conflict with the applicable Air Quality Plan.

4.2.5 Decommissioning Emissions – Alternative 1

At the end of the energy contract term, the facilities would be decommissioned and dismantled and the site restored. Decommissioning activities would require a workforce similar to that of construction. Activities for decommissioning of the Blythe Mesa Solar Project would include:

- Dismantling and removal of all above-ground equipment (solar panels, tracker units, transformers, substation, O&M building, etc.)
- Excavation and removal of all below-ground cabling
- Removal of posts
- Removal of primary roads (aggregate-based)
- Break-up and removal of concrete pads and foundations
- Scarification of compacted areas

Decommissioning of the 230-kV transmission line would be completed using traditional heavy construction equipment, such as front-end loaders, cranes, track-mounted and rubber-tired excavators, and motor graders. Dismantling would proceed in the following general stages: (1) dismantling and demolishing above-ground structures; (2) removing concrete foundations; (3) excavating and removing soiled and broken concrete from the site; and (4) surface contouring to return the disturbed area to its pre-Project state to the greatest extent feasible.

Table 10 presents an estimate of decommissioning emissions based on the assumption that the workforce and truck trips would be the same as construction emissions.

Table 10
Estimated Decommissioning Emissions
Blythe Mesa Solar Project

Emission Source	ROG	NOx	CO	SOx	PM_{10}	$PM_{2.5}$

Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*
Annual Construction Emissions, tons/year						
Heavy Construction Equipment	1.42	5.62	3.16	0.41	0.20	0.20
On-Road Vehicles	2.41	4.54	25.97	0.00	0.52	0.51
Construction Truck Trips					5.02	0.96
TOTAL	**3.83**	**10.16**	**29.13**	**0.41**	**5.74**	**1.67**
Significance Thresholds	25	25	100	25	15	15
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*

As shown in Table 10, emissions would be below the significance thresholds, and no significant impact would result from decommissioning activities.

4.3 Impacts – Alternative 2

As discussed in Section 1.0, Alternative 2 is the No Action/No Project Alternative. Under Alternative 2, the construction of a solar generating facility and associated infrastructure would not occur. Alternative 2 would therefore not generate air emissions associated with construction or operation and maintenance activities. Alternative 2 would therefore not result in any air quality impacts.

4.4 Impacts – Alternative 3

4.4.1 Construction Impacts – Alternative 3

Construction of Alternative 3 would be essentially identical to construction of Alternative 1, except for the total acreage that would be disturbed and the location of the 230 kV transmission line that extends outside of the solar array field to the Colorado River Substation. Alternative 3 would therefore require the same construction activities for construction of the solar array. Under Alternative 3, the total length of the transmission line both on-site and off-site would be 8.8 miles, and a total of 3,682 acres would be required for the solar array and associated infrastructure. As for Alternative 1, construction for Alternative 3 is anticipated to occur over a three-year period with the construction phases occurring simultaneously. Alternative 3 would require the same workforce and construction equipment as Alternative 1.

Emissions of ROG, SOx, and GHGs from heavy equipment used in construction of Alternative 3 were estimated based on the same assumptions as described under Alternative 1. Table 11 presents a summary of the daily construction emissions for the construction of the solar array, O&M buildings, substation, and transmission line based on the above assumptions and assuming standard mitigation measures would be implemented, in comparison with the MDAQMD significance thresholds.

Table 11
Estimated Construction Emissions – Solar Arrays, O&M Buildings, Substation and Transmission Line, Alternative 3
Blythe Mesa Solar Project

Emission Source	ROG	NOx	CO	SOx	PM_{10}	$PM_{2.5}$
Maximum Daily Construction Emissions, lbs/day						
Heavy Construction Equipment	35.35	99.36	63.31	12.81	4.61	4.10
On-Road Vehicles	19.10	33.84	207.51	0.02	4.04	4.00
Fugitive Dust	---	---	---	---	42.07	8.83
TOTAL	**54.45**	**133.20**	**270.82**	**12.83**	**50.72**	**16.94**
Significance Thresholds	137	137	548	137	82	82
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*
Annual Construction Emissions, tons/year						
Heavy Construction Equipment	1.71	13.97	8.65	0.39	0.62	0.55
On-Road Vehicles	2.41	4.55	25.97	0.00	0.52	0.52
Construction Truck Trips					5.02	0.96
TOTAL	**4.12**	**18.52**	**34.62**	**0.39**	**6.17**	**2.03**
Significance Thresholds	25	25	100	25	15	15
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*

As shown in Table 11, maximum daily emissions from construction of the solar array, O&M buildings, and substation for Alternative 3 would be below the significance thresholds for the maximum daily construction for all pollutants. Annual emissions would also be below the significance thresholds for all pollutants. Construction would therefore result in a less than significant impact on air quality.

Mitigation measures adopted under Alternative 1 would also be adopted under Alternative 3.

4.4.2 Operational Emissions – Alternative 3

Operations and maintenance activities under Alternative 3 would be identical to activities under Alternative 1, and emissions would therefore be the same as for Alternative 1. Impacts would be less than significant.

4.4.3 Toxic Air Contaminant Emissions – Alternative 3

Construction activities under Alternative 3 would be similar to those under Alternative 1. Emissions are slightly higher under Alternative 3 due to the slightly longer length of the transmission line; however, as with Alternative 1, due to the short-term nature of construction at the site, no adverse health effects would be anticipated from short-term diesel particulate emissions. Motor vehicle emissions would not be concentrated in any one area but would be dispersed along travel routes and would not be anticipated to pose a significant health risk to receptors.

4.4.4 Consistency with Ambient Air Quality Plans – Alternative 3

As for Alternative 1, because Alternative 3 will comply with the MDAQMD's Rules and Regulations, including those adopted from the SIP, the project will not conflict with the applicable Air Quality Plan.

4.4.5 Decommissioning Emissions – Alternative 3

Decommissioning activities under Alternative 3 would be similar to those under Alternative 1. As discussed under Alternative 1, emissions would be below the significance thresholds, and no air quality impact would occur.

4.5 Impacts – Alternative 4

4.5.1 Construction Impacts – Alternative 4

Construction of Alternative 4 would be essentially identical to construction of Alternative 1, except for the total acreage that would be disturbed and the location of the 230 kV transmission line that extends outside of the solar array field to the Colorado River Substation. Alternative 3 would therefore require the same construction activities for construction of the solar array. Under Alternative 4, the total length of the transmission line both on-site and off-site would be 9.5 miles, and a total of 3,648 acres would be required for the solar array and associated infrastructure. As for Alternative 1, construction for Alternative 4 is anticipated to occur over a three-year period with the construction phases occurring simultaneously. Alternative 4 would require the same workforce and construction equipment as Alternative 1.

Emissions of ROG, SOx, and GHGs from heavy equipment used in construction of Alternative 4 were estimated based on the same assumptions as described under Alternative 1. Table 12 presents a summary of the daily construction emissions for the construction of the solar array, O&M buildings, substation, and transmission line based on the above assumptions and assuming standard mitigation measures would be implemented, in comparison with the MDAQMD significance thresholds.

Table 12
Estimated Construction Emissions – Solar Arrays, O&M Buildings, Substation and Transmission Line, Alternative 4

Significance Thresholds	137	137	548	137	82	82
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*
Annual Construction Emissions, tons/year						
Heavy Construction Equipment	1.71	14.08	8.72	0.39	0.63	0.56
On-Road Vehicles	2.41	4.57	25.97	0.00	0.52	0.52
Construction Truck Trips					5.01	0.96
TOTAL	**4.12**	**18.65**	**34.70**	**0.39**	**6.16**	**2.03**
Significance Thresholds	25	25	100	25	15	15
Above Significance Thresholds?	*No*	*No*	*No*	*No*	*No*	*No*

As shown in Table 12, maximum daily emissions from construction of the solar array, O&M buildings, and substation for Alternative 4 would be below the significance thresholds for the maximum daily construction for all pollutants. Annual emissions would also be below the significance thresholds for all pollutants. Construction would therefore result in a less than significant impact on air quality.

Mitigation measures adopted under Alternative 1 would also be adopted under Alternative 4.

4.5.2 Operational Emissions – Alternative 4

Operations and maintenance activities under Alternative 4 would be identical to activities under Alternative 1, and emissions would therefore be the same as for Alternative 1. Impacts would be less than significant.

4.5.3 Toxic Air Contaminant Emissions – Alternative 4

Construction activities under Alternative 4 would be similar to those under Alternative 1. Emissions are slightly higher under Alternative 4 due to the slightly longer length of the transmission line; however, as with Alternative 1, due to the short-term nature of construction at the site, no adverse health effects would be anticipated from short-term diesel particulate emissions. Motor vehicle emissions would not be concentrated in any one area but would be dispersed along travel routes and would not be anticipated to pose a significant health risk to receptors.

4.5.4 Consistency with Ambient Air Quality Plans – Alternative 4

As for Alternative 1, because Alternative 4 will comply with the MDAQMD's Rules and Regulations, including those adopted from the SIP, the project will not conflict with the applicable Air Quality Plan.

4.5.5 Decommissioning Emissions – Alternative 4

Decommissioning activities under Alternative 4 would be similar to those under Alternative 1. As discussed under Alternative 1, emissions would be below the significance thresholds, and no air quality impact would occur.

5.0 Global Climate Change

Global Climate Change (GCC) refers to changes in average climatic conditions on Earth as a whole, including temperature, wind patterns, precipitation and storms. Global temperatures are moderated by naturally occurring atmospheric gases, including water vapor, carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O), which are known as greenhouse gases (GHGs). These gases allow solar radiation (sunlight) into the Earth's atmosphere, but prevent radiative heat from escaping, thus warming the Earth's atmosphere. Gases that trap heat in the atmosphere are often called greenhouse gases, analogous to a greenhouse. GHGs are emitted by both natural processes and human activities. The accumulation of GHGs in the atmosphere regulates the Earth's temperature. Emissions from human activities, such as burning fossil fuels for electricity production and vehicle use, have elevated the concentration of these gases in the atmosphere.

The State of California has been at the forefront of developing solutions to address GCC. GCC refers to any significant change in measures of climate, such as average temperature, precipitation, or wind patterns over a period of time. GCC may result from natural factors, natural processes, and/or human activities that change the composition of the atmosphere and alter the surface and features of land.

The United Nations Intergovernmental Panel on Climate Change (IPCC) constructed several emission trajectories of GHGs needed to stabilize global temperatures and climate change impacts. The IPCC concluded that a stabilization of GHGs at 400 to 450 ppm CO_2 equivalent concentration is required to keep global mean warming below 3.6º Fahrenheit (2º Celsius), which is assumed to be necessary to avoid dangerous climate change (Association of Environmental Professionals 2007).

State law defines greenhouse gases as any of the following compounds: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulfur hexafluoride (SF_6) (California Health and Safety Code Section 38505(g).) CO_2, followed by CH_4 and N_2O, are the most common GHGs that result from human activity.

The State of California GHG Inventory performed by the California Air Resources Board (ARB), compiled statewide anthropogenic GHG emissions and sinks. It includes estimates for CO_2, CH_4, N_2O, SF_6, HFCs, and PFCs. The current inventory covers the years 1990 to 2009, and is summarized in Table 13. Data sources used to calculate this GHG inventory include California and federal agencies, international organizations, and industry associations. The calculation methodologies are consistent with guidance from the IPCC. The 1990 emissions level is the sum total of sources and sinks from all sectors and categories in the inventory. The inventory is divided into seven broad sectors and categories in the inventory. These sectors include: Agriculture; Commercial; Electricity Generation; Forestry; Industrial; Residential; and Transportation.

Table 13 State of California GHG Emissions by Sector				
Sector	**Total 1990 Emissions ($MMTCO_2e$)**	**Percent of Total 1990 Emissions**	**Total 2009 Emissions ($MMTCO_2e$)**	**Percent of Total 2009 Emissions**
Agriculture	23.4	5%	32.13	7%
Commercial	14.4	3%	13.41	3%
Electricity Generation	110.6	26%	103.68	23%
Forestry (excluding sinks)	0.2	<1%	0.19	<1%
Industrial	103.0	24%	81.38	18%
Residential	29.7	7%	28.61	6%
Transportation	150.7	35%	172.92	38%
Recycling and Waste			7.32	2%
High GWP Gases			16.32	4%
Forestry Sinks	(6.7)		(3.80)	

When accounting for GHGs, all types of GHG emissions are expressed in terms of CO_2 equivalents (CO_2e) and are typically quantified in metric tons (MT) or millions of metric tons (MMT).

GHGs have varying global warming potential (GWP). The GWP is the potential of a gas or aerosol to trap heat in the atmosphere; it is the "cumulative radiative forcing effect of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to a reference gas" (USEPA 2006). The reference gas for GWP is CO_2; therefore, CO_2 has a GWP of 1. The other main greenhouse gases that have been attributed to human activity include CH_4, which has a GWP of 21, and N_2O, which has a GWP of 310. Table 14 presents the GWP and atmospheric lifetimes of common GHGs.

Table 14 Global Warming Potentials and Atmospheric Lifetimes of GHGs			
GHG	**Formula**	**100-Year Global Warming Potential**	**Atmospheric Lifetime (Years)**
Carbon Dioxide	CO_2	1	Variable
Methane	CH_4	21	12 ± 3
Nitrous Oxide	N_2O	310	120
Sulfur Hexafluoride	SF_6	23,900	3,200

Human-caused sources of CO_2 include combustion of fossil fuels (coal, oil, natural gas, gasoline and wood). Data from ice cores indicate that CO_2 concentrations remained steady prior to the current period for approximately 10,000 years. Concentrations of CO_2 have increased in the atmosphere since the industrial revolution.

CH_4 is the main component of natural gas and also arises naturally from anaerobic decay of organic matter. Human-caused sources of natural gas include landfills, fermentation of manure and cattle farming. Human-caused sources of N_2O include combustion of fossil fuels and industrial processes such as nylon production and production of nitric acid.

Other GHGs are present in trace amounts in the atmosphere and are generated from various industrial or other uses.

5.1 Potential Climate Change Impacts to Project

The Climate Scenarios Report (CCCC 2006), uses a range of emissions scenarios developed by the IPCC to project a series of potential warming ranges (i.e., temperature increases) that may occur in California during the 21st century. Three warming ranges were identified: Lower warming range (3.0 to 5.5 degrees Fahrenheit (ºF)); medium warming range (5.5 to 8.0 ºF); and higher warming range (8.0 to 10.5 ºF). The Climate Scenarios report then presents an analysis of the future projected climate changes in California under each warming range scenario.

According to the report, substantial temperature increases would result in a variety of impacts to the people, economy, and environment of California. These impacts would result from a

projected increase in extreme conditions, with the severity of the impacts depending upon actual future emissions of GHGs and associated warming. These impacts are described below.

Public Health. Higher temperatures are expected to increase the frequency, duration, and intensity of conditions conducive to air pollution formation. For example, days with weather conducive to O_3 formation are projected to increase by 25 to 35 percent under the lower warming range and 75 to 85 percent under the medium warming range. In addition, if global background O_3 levels increase as is predicted in some scenarios, it may become impossible to meet local air quality standards. An increase in wildfires could also occur, and the corresponding increase in the release of pollutants including $PM_{2.5}$ could further compromise air quality. The Climate Scenarios report indicates that large wildfires could become up to 55 percent more frequent of GHG emissions are not significantly reduced.

Potential health effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme events, and air quality. There may be direct temperature effects through increases in average temperature leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress and heat-related problems (e.g., heat rash and heat stroke). In addition, climate sensitive diseases (such as malaria, dengue fever, yellow fever, and encephalitis) may increase, such as those spread by mosquitoes and other disease-carrying insects.

Climate change could affect the project area in that it is located in the desert area of California, where warmer climates may lead to more of the problems identified above related to heat, should increases in average temperature in the project area occur.

Water Resources. A vast network of reservoirs and aqueducts capture and transport water throughout the State from northern California rivers and the Colorado River. The current distribution system relies on Sierra Nevada mountain snowpack to supply water during the dry spring and summer months. Rising temperatures, potentially compounded by decreases in precipitation, could severely reduce spring snowpack, increasing the risk of summer water shortages. In addition, if temperatures continue to rise more precipitation would fall as rain

instead of snow, further reducing the Sierra Nevada spring snowpack by as much as 70 to 90 percent. The State's water resources are also at risk from rising sea levels. An influx of seawater would degrade California's estuaries, wetlands, and groundwater aquifers.

This global climate change impact is not likely to have a direct effect on the operation of the project.

Agriculture. Increased GHG and associated increases in temperature are expected to cause widespread changes to the agricultural industry, reducing the quantity and quality of agricultural products statewide. Significant reductions in available water supply to support agriculture would also impact production. Crop growth and development will change as will the intensity and frequency of pests and diseases. This effect of global climate change would not be anticipated to affect the project site directly because there are no agricultural uses present.

Ecosystems/Habitats. Continued global warming will likely shift the ranges of existing invasive plants and weeds, thus alternating competition patterns with native plants. Range expansion is expected in many species while range contractions are less likely in rapidly evolving species with significant populations already established. Continued global warming is also likely to increase the populations of and types of pests. Continued global warming would also affect natural ecosystems and biological habitats throughout the State. This effect of global climate change could affect current ecosystems/habitats at the project site.

Wildland Fires. Global warming is expected to increase the risk of wildfire and alter the distribution and character of natural vegetation. If temperatures rise into the medium warming range, the risk of large wildfires in California could increase by as much as 55 percent, which is almost twice the increase expected if temperatures stay in the lower warming range. However, since wildfire risk is determined by a combination of factors including precipitation, winds, temperature, and landscape and vegetation conditions, future risks will not be uniform throughout the State. Should global climate change in the southern California region lead to increased risk of wildfires, this impact could directly affect the project site in that the potential for wildfire at the project location would increase.

Rising Sea Levels. Rising sea levels, more intense coastal storms, and warmer water temperatures will increasing threaten the State's coastal regions. Under the high warming scenario, sea level is anticipated to rise 22 to 35 inches by 2100. A sea level risk of this magnitude would inundate coastal areas with salt water, accelerate coastal erosion, threaten levees and inland water systems, and disrupt wetlands and natural habitats. Because the project site is located in the high desert area, it is not anticipated that rising sea levels would have a direct affect on the project.

5.2 Impacts

The effects of project-specific GHG emissions are cumulative, and therefore GCC impacts are addressed as a cumulative, rather than a direct, impact. The guidance for determining significance of impacts has been developed from the requirements of AB 32. The guideline addresses the potential cumulative impacts that a project's GHG emissions could have on GCC. Based on Appendix G of the CEQA Guidelines, the following criteria are used to evaluate whether a project would result in a significant impact for GCC impacts:

Would the project:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

As discussed in Section 15064.4 of the CEQA Regulations, the determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:

(1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use. The lead agency has discretion to select the model or methodology it considers most appropriate provided it supports its decision with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use; and/or

(2) Rely on a qualitative analysis or performance based standards.

A lead agency should consider the following factors, among others, when assessing the significance of impacts from greenhouse gas emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

Different agencies and studies estimate different goals for reduction of emissions to achieve 1990 levels by the year 2020, as set forth in AB 32. Some agencies have estimated a reduction of 28 percent to 29 percent, based on the ARB's analysis that statewide 2020 business as usual GHG emissions would be 596 $MMTCO_2e$, with 1990 emissions of 427 $MMTCO_2e$, for a reduction of 28.35% (ARB 2008).

Projects that meet the criteria for conducting a climate change analysis are required to conduct a GHG inventory and disclose GHG emissions associated with project implementation and

operation under "business as usual" conditions. "Business as usual" is defined as the emissions that would have occurred in the absence of reductions mandated under AB 32.

The main source of greenhouse gas emissions associated with the projects would be combustion of fossil fuels during construction of the project. Emissions of GHG were calculated using the same approach as emissions for overall construction emissions discussed in Section 4.1. Estimated emissions of construction greenhouse gases for Alternative 1 are summarized in Table 15. Emission calculations are provided in Appendix A.

Table 15
Construction Greenhouse Gas Emissions – Alternative 1

Emissions, metric tons/year	**CO_2**
Solar Array, O&M Building, Substation and Transmission Line	5,479
Total	**5,479**

Some lead agencies recommend amortization of GHG emissions associated with construction activities over a 30-year period to account for the project's contribution over the lifetime of the project (SCAQMD 2008, County of San Diego 2010). Amortization of the construction emissions for the Blythe Mesa Solar Project would result in a contribution of 183 metric tons of CO_2e emissions over the lifetime of the project.

GHG emissions associated with the construction of Alternative 3 would be similar to construction of Alternative 1, with a total of 5,480 metric tons of CO_2e annually. GHG emissions associated with the construction of Alternative 4 would be similar to construction of Alternative 1, with a total of 5,483 metric tons of CO_2e annually. Amortized over a 30-year period, the emissions from both of these alternatives would be the same as Alternative 1, at 183 metric tons of CO_2e emissions.

Emissions associated with construction would be temporary, likely to occur in only one three-year period. Emissions associated with operations are estimated to be 271 metric tons per year of CO_2e, which is below the CAPCOA recommended threshold of 900 metric tons per year of CO_2e. Operational impacts to global climate change would therefore be less than significant.

Adding the amortized construction emissions to the operational emissions would result in an estimate of 453 metric tons of CO_2e annually, which remains below the CAPCOA recommended threshold of 900 metric tons per year of CO_2e.

It should also be noted that the purpose of the project is to provide electricity generation from a renewable resource. The Blythe Mesa Solar Project would serve to meet the state's goals for the Renewable Portfolio Standard, which has been identified by the state as a means of meeting the goals of AB 32 to reduce emissions to 1990 levels by the year 2020.

The project is proposed to produce approximately 485 MW of electrical energy, which would be approximately 1,062,635,000 kilowatt hour (kWh) of electrical energy per year. In comparison, GHG emissions were estimated for a conventional fossil-fuel combustion power plant producing the same electrical energy (kWh) per year as the Project facility. Data from the U.S. Department of Energy, USEPA, and the Electric Power Research Institute provided GHG production rates per megawatt (MWh). GHG emissions from the most efficient combined cycle gas turbine power plant and a coal-fired power plant were calculated based on 0.35 and 1.0 metric tons of CO_2 equivalent (CO_2e) per MWh of electricity produced by gas turbine and coal-fired plants, respectively. Therefore, gas turbine and coal-fired plants are estimated to produce approximately 371,922 and 1,062,635 metric tons of CO_2e, respectively.

The net GHG displacement or off-set would therefore be the difference between the annual operational GHG emissions associated with the Blythe Mesa Solar Project and the emissions associated with operation of a conventional power plant. The project would result in a net GHG displacement through the replacement of fossil-fuel generated electricity with solar electricity of from 371,116 to 1,061,829 metric tons of CO_2e. Operation of the Blythe Mesa Solar Project would therefore result in a substantial net reduction (displacement) in GHG emissions in the region with the implementation of the Project's solar facility, when compared to a conventional fossil-fuel combustion power plant.

The Project's construction and operational emissions would therefore be offset by the Project's provision of renewable energy that would replace conventionally-generated electricity in the service area.

Because the project's construction GHG emissions are temporary, and the project's long-term operational GHG emissions are less than significant, and the project would result in a reduction in GHG emissions, the project is therefore consistent with the goals of AB 32 and impacts to global climate are less than significant.

6.0 Cumulative Impacts

In analyzing cumulative impacts from a proposed project, the analysis must specifically evaluate a project's contribution to the cumulative increase in pollutants for which the air basin for the Project area is listed as "non-attainment" for the federal or state AAQS. In the event direct impacts from a project are less than significant, a project may still have a cumulatively considerable impact on air quality if the emissions from the project, in combination with the emissions from other proposed, or reasonably foreseeable future projects are in excess of screening levels identified above, and the project's contribution accounts for more than an insignificant proportion of the cumulative total emissions.

As discussed in Section 2.0, the air basin for the Project area is considered an unclassified/attainment area for all of the NAAQS. The air basin for the Project area is considered a moderate nonattainment area for the CAAQS for O_3 and a nonattainment area for the CAAQS for PM_{10}. The air basin for the Project area is considered unclassified/attainment for all CAAQS for the other criteria pollutants.

While the region is nonattainment for the CAAQS for O_3 and PM_{10}, not all projects would result in a significant impact to air quality. Permitting agencies and lead agencies with jurisdiction over nonattainment areas, such as the USEPA and the MDAQMD, typically establish thresholds below which a project would have neither direct, nor cumulative impacts. The Blythe Mesa Solar Project's potential for air quality impacts are mainly attributable to construction activities.

Each air district in a nonattainment area is responsible for developing emissions inventory data as part of the planning process to develop its attainment plan. The emissions budget for the MDAQMD includes emissions associated with construction activity, including construction equipment, fugitive dust, and vehicles. The MDAQMD construction emissions budget for off-road construction equipment and vehicles includes 1.63 tons per day of ROG, 4.67 tons per day of NOx and 0.28 tons per day of PM_{10}. The MDAQMD fugitive dust emissions budget attributable to construction activities also includes 8.77 tons per day of PM_{10}. During construction, the Blythe Mesa Solar Project's estimated ROG emissions are less than 1 percent of the total emissions budget, NOx emissions are less than 1 percent of the total emissions budget, and PM_{10} emissions are less than 1 percent of the total emissions budget. Operational emissions of nonattainment pollutants are also a small percentage of the overall emissions budget for the air basin. The Blythe Mesa Solar Project's emissions are therefore not cumulatively considerable. Because the project would also provide renewable energy, the project would reduce emissions of both criteria pollutants and greenhouse gases, thus lessening the amount of pollution emitted overall.

7.0 Conclusions and Recommendations

In summary, the proposed project and Alternatives 3 and 4 would result in emissions of air pollutants for both the construction phase and operational phase of the project. The air quality impact analysis evaluated the potential for adverse impacts to the ambient air quality due to construction and operational emissions. Construction emissions would include emissions associated with fugitive dust, heavy construction equipment and construction workers commuting to and from the site. The emissions associated with construction would be below the MDAQMD's significance thresholds for all pollutants. Emissions from construction would be temporary. The project would implement mitigation measures in accordance with MDAQMD Rule 403 to reduce emissions to the extent possible. Construction impacts would be less than significant.

Project operational emissions would be minor and would only be associated with operation and maintenance activities. These activities would involve on-road vehicle travel, minor heavy equipment use, and emissions associated with periodic solar panel washing activities. Operational emissions are less than significant.

The project would provide renewable energy and would therefore serve the purpose of meeting the state's goals for renewable energy as set forth in AB 32. The project would therefore not conflict with the goals of AB 32 in reducing emissions of GHG, and would result in a less than significant impact on global climate.

Table A-3a. Offroad Emissions Calculation - Using SCAB Emission Factors - Alternative 1

2012 SCAB emission factors (EFs) corresponding to OFFROAD2007 model are applied to CO2, ROG, and SOX.
Tier 2 and 3 EFs are applied to NOx, PM, and CO. Calculation details are provided in *Offroad Tier 2* and *Offroad Tier 3* worksheets.
Load factors are used in conjunction with Tier 2and 3 EFs.

Table A-3b. Offroad Emissions Calculation - Using SCAB Emission Factors - Alternative 3

2012 SCAB emission factors (EFs) corresponding to OFFROAD2007 model are applied to CO2, ROG, and SOX.
Tier 2 and 3 EFs are applied to NOx, PM, and CO. Calculation details are provided in *Offroad Tier 2* and *Offroad Tier 3* worksheets.
Load factors are used in conjunction with Tier 2and 3 EFs.

Table A-3c. Offroad Emissions Calculation - Using SCAB Emission Factors - Alternative 4

2012 SCAB emission factors (EFs) corresponding to OFFROAD2007 model are applied to CO2, ROG, and SOX.
Tier 2 and 3 EFs are applied to NOx, PM, and CO. Calculation details are provided in *Offroad Tier 2* and *Offroad Tier 3* worksheets.
Load factors are used in conjunction with Tier 2and 3 EFs.

Table A-4c. Offroad Emissions Calculations - Using Tier 2 Emission Factors - Alternative 4

Tier 2 emission factors (EFs) are applied to NOx, PM, and CO. Load Factors (LFs) are used in conjunction with Tier 2 EFs.
2012 SCAB EFs (OFFROAD2007) are applied to CO2, ROG, and SOX. Calculation detail is provided in Offroad SCAB worksheet.

a) The PM standard for hand-start, air cooled, direct injection engines below 11 hp may be delayed until 2010 and be set at 0.45 g/bhp-hr.
b) Standards given are NMHC/NOx/CO/PM in g/bhp-hr.
c) Engine families in this power category may alternately meet Tier 3 PM standards (0.30 g/bhp-hr) from 2008-2011 in exchange for introducing final PM standards in 2012.
d) The implementation schedule shown is the three-year alternate NOx approach. Other schedules are available.
e) Certain manufacturers have agreed to comply with these standards by 2005.

INTRODUCTION

The proposed Blythe Mesa Solar Project (BMSP, Project) consists of construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure to provide site access and connection to the statewide electricity transmission grid. This technical report analyzes the biological resources with the potential to occur within the proposed Project. The analysis consists of a review of published peer-reviewed documents, databases and biological reports in conjunction with biological field surveys to determine areas that have suitable habitat to potentially support listed, proposed for listing, and candidate threatened and endangered species, and other identified sensitive species. This technical report first addresses the applicable laws, ordinances, regulations, and a standard related to biological resources, and then describes conditions in the study area, which encompasses the proposed disturbance area.

1.0 PROJECT DESCRIPTION

The Project is proposed to be located on approximately 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587 acres for the solar field and 73 acres for the 230 kilovolt (kV) transmission line interconnect. The power produced by the Project would be conveyed to the local power grid via interconnection to the Southern California Edison Colorado River Substation, an approved new substation located south of Highway 10 and approximately four miles west of the Project site.

1.1 PROJECT LOCATION AND COMPONENTS

The 3,660-acre site is five miles west of Blythe and consists mostly of agricultural land, including citrus orchards. The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5' U.S. Geological Survey (USGS) Topographic Quadrangles (see Figure 1). The Project is located on:

- Sections 11 and 12 of Township 7 South, Range 21 East
- Sections 3, 4, 5, 6, 8, 9 of Township 7S, South, Range 22 East
- Sections 27, 28, 29, 32, 33, 34 of Township 6 South, Range 22 East, of the San Bernardino Base Meridian

State Highway 10 bisects the Project area, which is bounded on the north and south by undeveloped open desert, on the east by agricultural lands, and on the west by the Blythe City Airport and open desert lands.

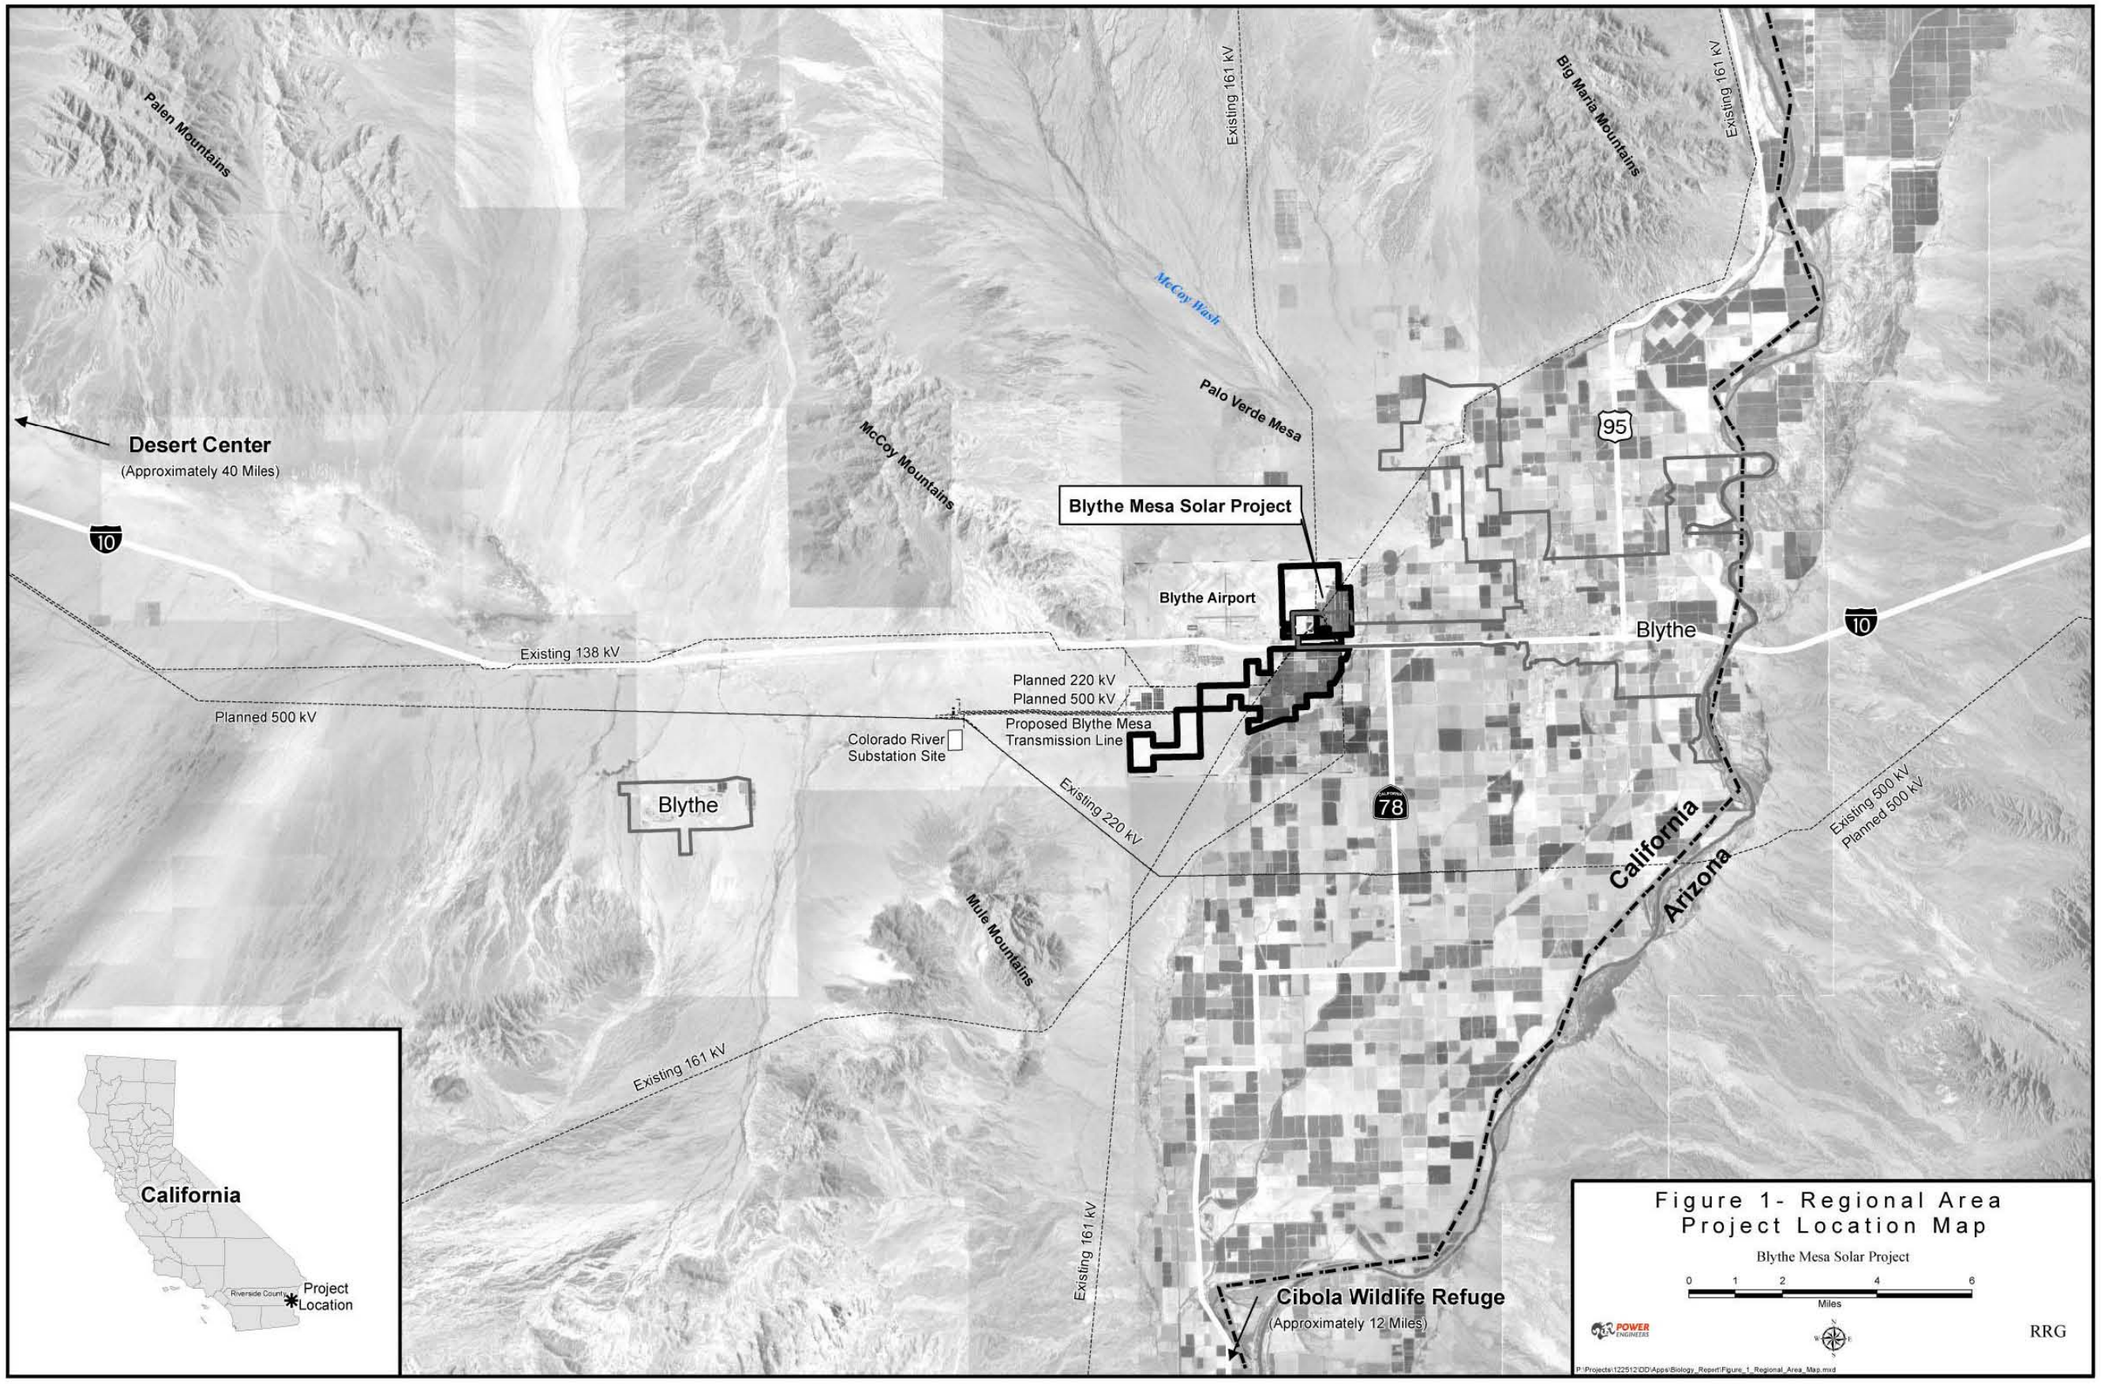
The Project would utilize single-axis PV trackers with silicon solar panels. All panels would be oriented in the same direction as they track the sun's movement. By design, the PV panels absorb sunlight to maximize electrical output and use anti-reflective glass, resulting in about half the reflectance of standard residential and commercial glass. Due to the limited rotation angles, the solar panels have no potential for reflecting the sun's rays upon any ground-plane position.

The panels would be configured into trackers, and the trackers configured into blocks. Each block comprises six trackers with 18 north-south oriented rows of PV panels (295 feet long and 140 feet wide) that rotate up to 45 degrees from east to west to follow the daily motion of the sun, with the center of rotation being approximately four to eight feet above grade. The panels would be supported by micro-piles that would be driven directly into the ground to a depth of 8 to 12 feet using a vibration technology to reduce noise impacts. Torque tubes, electrical wire trays, and panels would then be installed on the piles. Concrete foundations for the drive motors (devices used to move the drive strut back and forth) would be poured in place, and electrical equipment for the array would be set in place. A tracked backhoe would drive piles. No blasting or rock breaking is anticipated or proposed. Small truck-mounted cranes or grade-all forklifts would place trackers on support piles.

Individual PV panels would be connected together in series to create a "string" to carry direct current (DC) electricity. Multiple DC strings would be brought together into an above-ground combiner box to merge the strings into a single high-current cable. From the combiner boxes, the cabling would run in raceways and underground to inverters (5.0 feet wide and 10.5 feet tall) mounted on small concrete pads (minimum 0.5 feet above grade) distributed across the site. The inverters would take the DC output from the combiner boxes and convert it to alternating current (AC) electricity. Within the solar field, dirt access roads 12 feet wide would be constructed approximately every 200 to 400 feet to allow access and maintenance of the solar panels.

Next, the alternating current (AC) electricity would be increased to medium voltage with a standard "step-up" transformer. The medium voltage collection lines would begin at the inverter/transformer pads and would be placed in trenches until the output from 10 to 15 blocks is gathered and transferred at risers to a system of overhead medium voltage collection lines for transmission to the substation. The medium voltage collection circuits would be mounted above-ground on poles (35 to 60 feet tall) and carry 20 to 30 MW of electricity.

The three Project substations (each 300 feet long by 300 feet wide) would collect all the medium-voltage circuits (34.5 kV) and would step up the voltage to 230 kV.



The Project substations and the interconnection point would be linked by a 230 kV double-circuit transmission line. The transmission line facilities include a single set of tubular steel poles that are 85 to 125 feet tall with an average distance between poles of 500 to 800 feet. The poles would be directly embedded in the soil or set in concrete foundations approximately 20 to 30 feet deep. Access roads to each structure will be 16 to 20 feet wide by eight inches deep of gravel over compacted subgrade and located within the proposed right-of-way (ROW).

Two operation and maintenance (O&M) buildings—approximately 3,500 square feet each, enclosed, and no more than 30 feet tall—would provide work and storage space. A covered outdoor temporary assembly and storage area (80,000 square feet, 25 feet tall) would be directly adjacent to the O&M buildings.

The site would be enclosed with equestrian-type fencing that would typically be set 30 feet from the array. The fence would be approximately seven feet high and consist of posts set into the ground on approximately 8- to 12-foot spacing, with approximately six strands of smooth wire at about one-foot vertical spacing.

All of the solar panels, substations, inverters, and O&M facilities would be located on lands in private ownership. The transmission line easement, from the Colorado River Substation to near the Project site substation, would be located mostly on federal land under management of the U.S. Department of the Interior, Bureau of Land Management (BLM) and some private land.

THIS PAGE INTENTIONALLY LEFT BLANK

2.0 REGULATORY FRAMEWORK

The Project must comply with various federal, State, and local laws. While some laws and policies provide constraints, others provide intent and direction for certain actions to occur. The following is a general overview of such guidance, which gives intent or direction for the proposed Project relevant to biological resources.

2.1 FEDERAL

Endangered Species Act of 1973; 16 USC § 1531 et seq.; 50 CFR Parts 17 and 222

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

The Endangered Species Act (ESA) includes provisions for protection and management of species that are federally listed as threatened or endangered or proposed for such listing, and of designated critical habitat for these species. The administering agency for the above authority for non-marine species is the U.S. Fish and Wildlife Service (USFWS).

Migratory Bird Treaty Act: 16 USC § 703-711; 50 CFR Subchapter B

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

The Migratory Bird Treaty Act (MBTA) includes provisions for protection of migratory birds, including basic prohibitions against any taking not authorized by federal regulation. The administering agency for the above authority is the USFWS. The law contains no requirement to prove intent to violate any of its provisions. Wording in the MBTA makes it clear that most actions that result in "taking" or possession (permanent or temporary) of a protected species can be a violation of the act. The word "take" is defined as "pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to pursue, hunt, shoot, wound, kill, trap, capture, or collect (including nests, eggs, and feathers)."

Bald and Golden Eagle Protection Act

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

Bald eagle protection began in 1940 with the passage of the Eagle Protection Act, which was later amended to include golden eagle and was renamed. The Bald and Golden Eagle Protection Act makes it unlawful to import, export, take, sell, purchase, or barter any bald eagle or golden eagle, their parts, products, nests, or eggs. Take includes pursuing, shooting, poisoning, wounding, killing, capturing, trapping, collecting, molesting, or disturbing. Exceptions may be granted by USFWS for scientific or exhibition use, or for traditional and cultural use by Native Americans. However, no permits may be issued for import, export, or commercial activities involving eagles.

Clean Water Act (33 USC Section 1251 et seq.)

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

The Clean Water Act (CWA) is the principal federal statute protecting navigable waters and adjoining shorelines from pollution. The Clean Water Act is administered by the Environmental Protection Agency (EPA) and the U.S. Army Corps of Engineers (USACE). USACE is responsible for regulating the discharge of fill material into waters of the United States. Waters of the United States include lakes, rivers, streams and their tributaries, as well as wetlands. Since its enactment, the CWA prohibits the discharge of pollutants into waters of the United States without a permit. Section 404 of the CWA provides that whenever any person dredges or places any fill material from or into waters of the U.S. including, without limitation, wetlands, streams, and bays (e.g., while undertaking road construction, bridge construction, or streambed alteration), a permit is required from USACE. Through field reconnaissance surveys and analyses of National Wetlands Inventory (NWI) and watershed data, it is

unlikely that there are any jurisdictional waters of the U.S. within the Project area. It is anticipated that USACE will not assert jurisdiction over any waters and/or aquatic features occurring within the disturbance area.

Northern and Eastern Colorado Desert Coordinated Management Plan (BLM 2002)

Applicable to the transmission line (BLM jurisdiction)

The Northern and Eastern Colorado Desert Coordinated Management (NECO) Plan is a landscape-scale, multi-agency planning effort that protects and conserves the natural resources of the California portion of the Sonoran Desert while also managing its use for humans. This plan was prepared under the same regulations that implement the Federal Land Policy and Management Act of 1976. The NECO Plan provides management areas for the desert tortoise (*Gopherus agassizii*), a system of integrated ecosystem management for special-status species and natural communities on federal lands, and regional standards and guidelines for public land health on BLM lands.

California Desert Conservation Area Plan

Applicable to the transmission line (BLM jurisdiction)

The California Desert Conservation Area (CDCA) Plan guides the management of all BLM-administered lands in the Mojave, Sonoran, and a small portion of the Great Basin Deserts. In total, the CDCA Plan includes an area of approximately 25 million acres, 12 million of which are public lands. The primary goal of the CDCA Plan is to provide guidance for the overall maintenance of the land while simultaneously planning for multiple uses and balancing the human needs with the need to protect the natural environment.

Executive Order 11312

Applicable to the transmission line (BLM jurisdiction)

This Executive Order from 1999 requires all federal agencies to prevent and control the introduction of invasive non-native species in cost-effective and environmentally sound manners. It established a nation-wide Invasive Species Council and Invasive Species Advisory Committee to oversee and facilitate the implementation of the Executive Order.

2.2 STATE

California Endangered Species Act of 1984, California Fish and Game Code § 2050-2098

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

The California Endangered Species Act (CESA) includes provisions for the protection and management of species listed by the State as endangered or threatened, or designated as candidates for such listings. CESA includes a requirement for consultation "to ensure that any action authorized by a state lead agency is not likely to jeopardize the continued existence of any endangered or threatened species… or result in the destruction or adverse modification of habitat essential to the continued existence of the species" (§ 2090). Plants of California declared to be endangered, threatened, or rare are listed at 14 California Code of Regulations (CCR) §670.2. Animals of California declared to be endangered, threatened, or rare are listed at 14 CCR §670.5. The administering agency for the above authority is the California Department of Fish and Game (CDFG).

California Fish and Game Code Section 3503, 3511, 4700, 5050, and 5515

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

These California Fish and Game Codes (CFGC) list bird (primarily raptor), mammal, amphibian, and reptile species that are classified as fully protected in California. Fully protected species are prohibited from being taken or possessed except under specific permit requirements. These Codes also prohibit the take, possession, or needless destruction of the nests or eggs of any bird, including birds of prey or their nests or eggs, except as otherwise provided by the code or any regulation made pursuant thereto.

Native Plant Protection Act (CFGC Section 1900 et seq.)

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

The California Native Plant Protection Act prohibits importation of rare and endangered plants into California, "take" of rare and endangered plants, and sale of rare and endangered plants. CESA defers to the California Native Plant Protection Act, which ensures that State-listed plant species are protected when State agencies are involved in projects subject to the California Environmental Quality Act (CEQA). In this case, plants listed as rare under the California Native Plant Protection Act are not protected under CESA but rather under CEQA.

California Fish and Game Code §1600-1616 – Streambed Alteration Agreement

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

This Code requires that any person, state or local government agency, or public utility notify CDFG and obtain a streambed alteration agreement before they begin any construction project that will divert, obstruct, or change the natural flow or the bed, channel, or bank of any river, stream, or lake, use materials from a streambed, or result in the disposal or disposition of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into any river, stream, or lake. In general, CDFG jurisdiction extends to the top of the stream or bank, or to the outer edge of riparian vegetation, whichever is wider.

Porter-Cologne Water Quality Control Act of 1969 (California Water Code Section 13000 et seq.)

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

The Porter-Cologne Water Quality Control Act provides state coordination with the Clean Water Act, which is described above. It provides a mechanism by which the Regional Water Quality Control Boards (RWQCBs) certify federally issued CWA permits to ensure the compatibility of federal and state water quality guidelines. The act provides for the development and periodic review of water quality control plans (basin plans) that designate beneficial uses of California's major rivers and groundwater basins and establish narrative and numerical water quality objectives for those waters. Basin plans are primarily implemented by using the National Pollution Discharge Elimination System permitting system to regulate waste discharges to ensure that water quality objectives are met. Waste discharges may include fill, any material resulting from human activity, or any other "discharge" that may directly or indirectly impact waters of the State relative to the implementation of Section 401 of the CWA.

2.3 LOCAL ORDINANCES

Riverside General Plan, Land Use and Multi-Purpose Open Space Elements (2003)

Applicable to the solar array (private land) and transmission line (BLM jurisdiction)

Riverside County requires actions to ensure that proposed development projects demonstrate a high degree of compatibility with any threatened or endangered species habitat they may affect. The administering agency is the Riverside County Planning Department.

3.0 INVENTORY METHODS

The evaluation of biological resources included a review of applicable documents and the identification of resources during the reconnaissance-level survey and focused surveys conducted by qualified biologists. The details and methods used in this evaluation are presented below.

3.1 APPROACH TO DATA COLLECTION

The first step in the approach to data collection for this analysis was the identification and characterization of biological resources, including vegetation community types, riparian habitats, and special-status plant and animal species that are known to occur or have potential to occur in the Project area. The biological study area included the Project site and adjacent lands containing suitable habitat for biological species. For the purpose of this report, "study area" refers to the Project site and adjacent lands.

"Special-status" as used in this section refers to species that are:

- Listed, proposed for listing, or candidates for listing as threatened or endangered under the Federal Endangered Species Act (FESA) (50 CFR 17.12 [listed plants], 50 CFR 17.11 [listed animals], 67 FR 40657 [candidate species], and various notices in the Federal Register [FR] [proposed species]);

- Listed or proposed for listing by the State of California as threatened or endangered under the California Endangered Species Act (CESA) (CDFG 2011a);

- Identified by the California Department of Fish and Game (CDFG) as species of concern or fully protected species, including fish and wildlife that do not have state or federal threatened or endangered status but may still be threatened with extinction (CDFG 2011b);

- California Species of Special Concern (CSC), vertebrate species that have been designated as "species of special concern" by the CDFG because declining population levels, limited range, and/or continuing threats have made them vulnerable to extinction (CDFG 2011b);

- Listed by the Bureau of Land Management (BLM) as sensitive (BLM 2007);

- Listed by the CNPS as List 1A (presumed extinct in California), 1B (rare, threatened, and endangered in California and elsewhere), or 2 (rare, threatened, or endangered in California, but more common elsewhere). CNPS List 1A, 1B, and 2 species are considered special-status plant species if they fall within any of these categories as defined in the NPPA, CFGC Section 1901, or the CESA, CFGC Sections 2050 through 2098 (CNPS 2001, 2011);

- Covered as a State-protected furbearing mammal (PFM); or

- Otherwise defined as rare, threatened, or endangered under the California Environmental Quality Act;

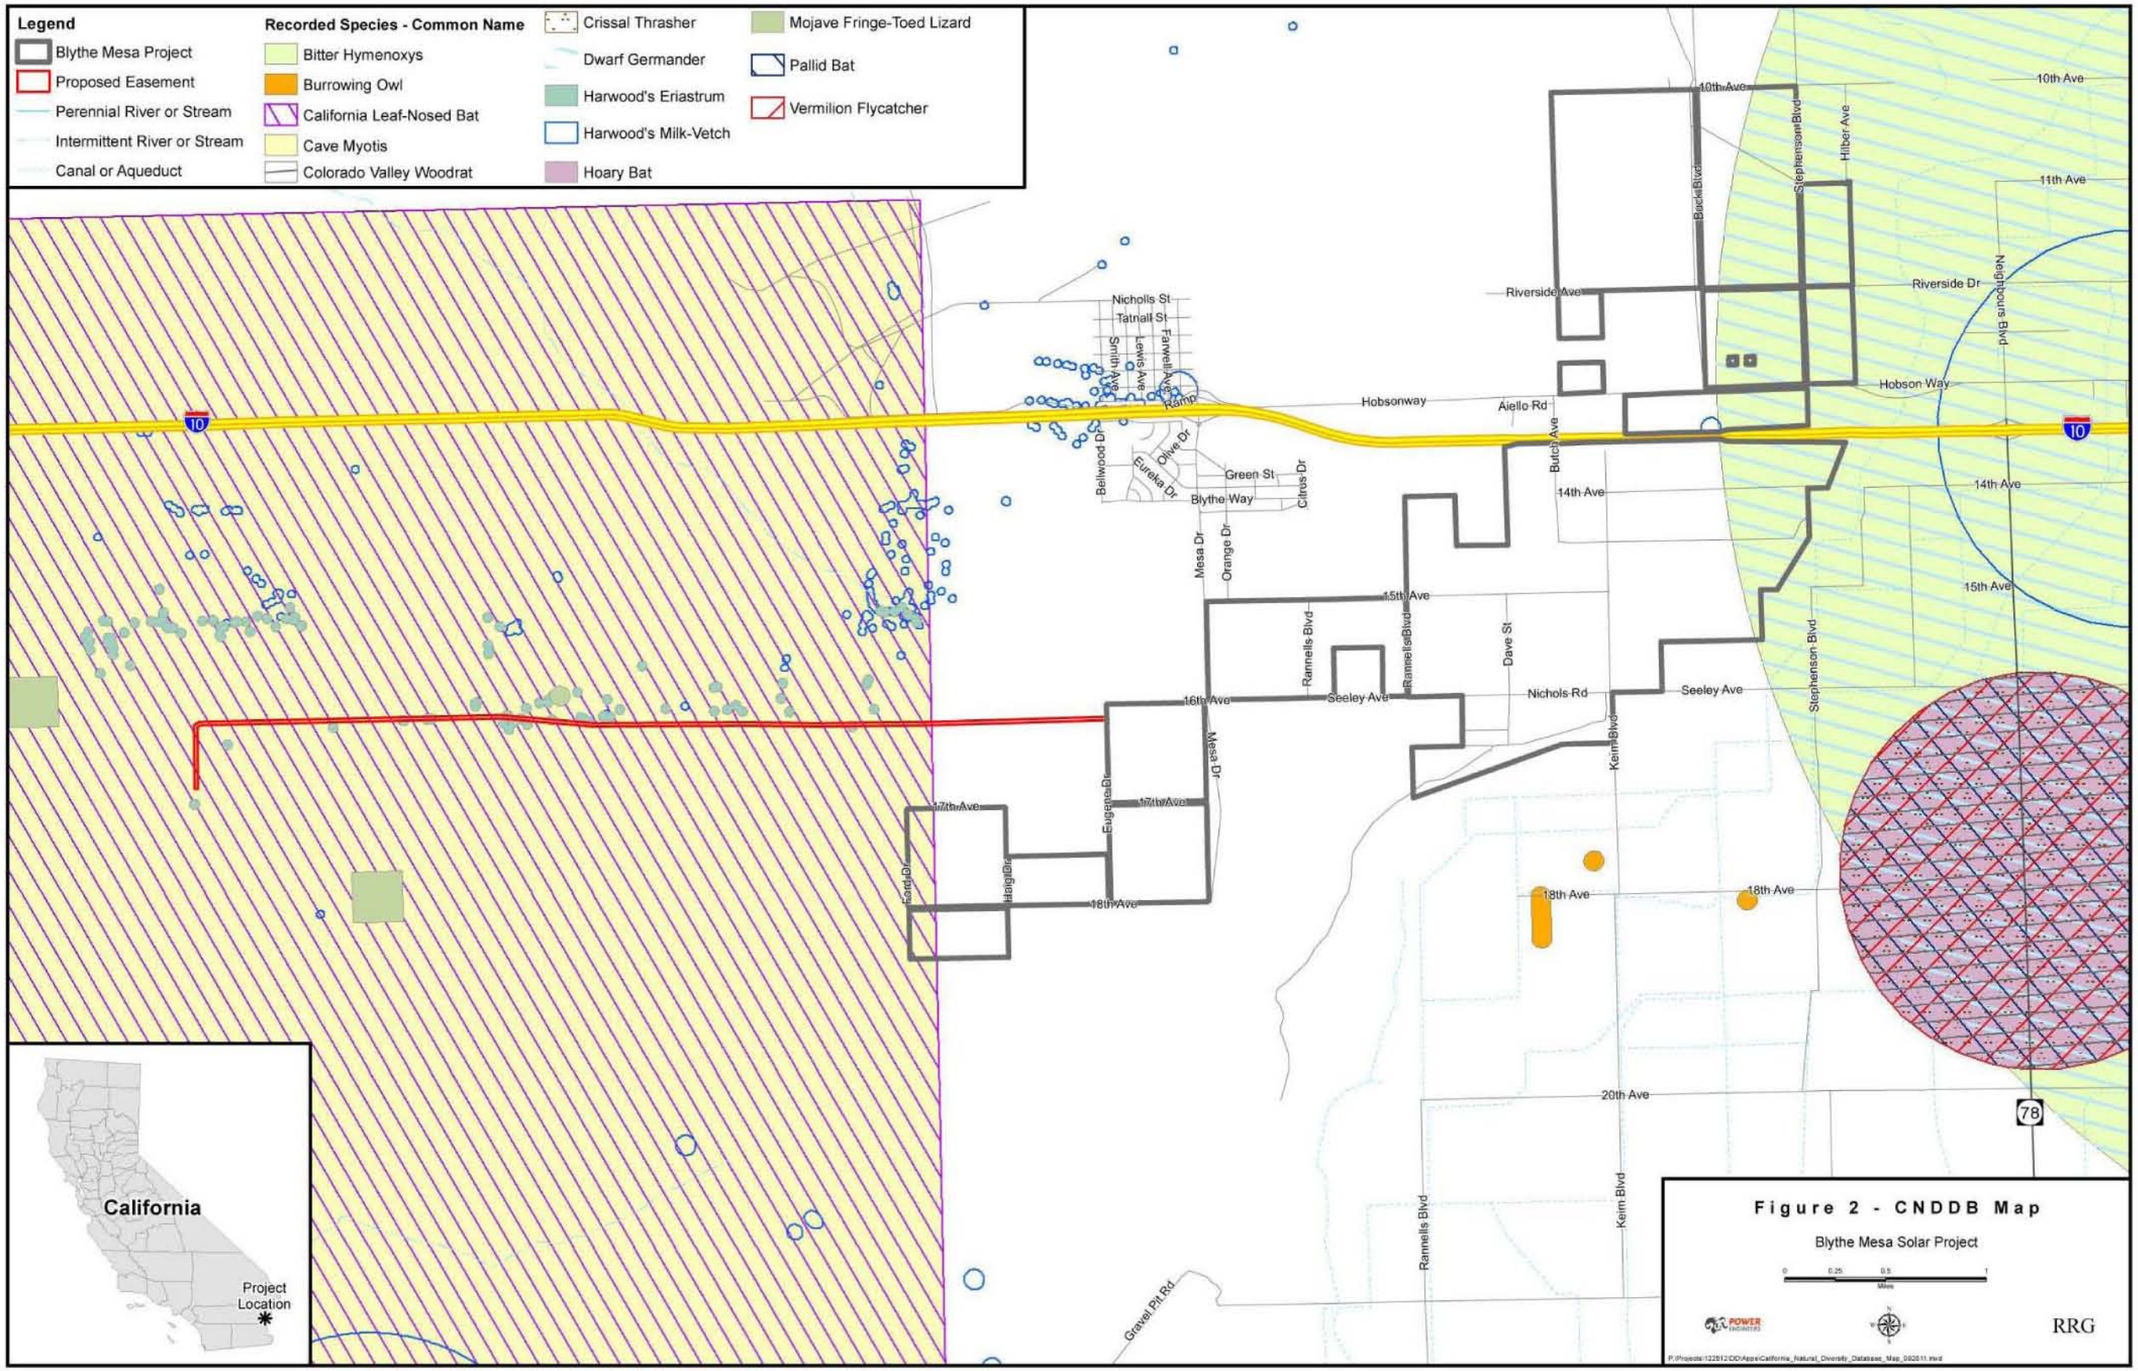
The NECO Plan (BLM and CDFG 2002) was consulted for lands designated as Wildlife Management Areas, documentation of sensitive vegetation communities, and documentation of special-status plant and wildlife species. Several plant and wildlife special-status species with potential for occurrence within the study area are described in the NECO Plan.

Only CNPS Lists 1 and 2 are considered to be "special status" species because of their higher sensitivity to impacts. CNPS List 3 and List 4 species are of lower sensitivity; the mitigation for impacts to sensitive vegetation communities would provide compensation for impacts to these species, so no additional mitigation for impacts to them would be required.

3.2 LITERATURE REVIEW

Preliminary investigation included review of information obtained from the USFWS, CDFG, BLM, literature searches, reports from surrounding projects, examinations of aerial photographs, and database searches including CNPS, California Natural Diversity Data Base (CNDDB) records, and other sensitive species accounts for Riverside County. Regional resource planning documents prepared by federal, state and local agencies were also reviewed, including the NECO Plan, the CDCA Plan, and the Riverside General Plan. Additionally, USFWS was consulted regarding the federal listed species that could occur within the Project quads. USFWS identified only desert tortoise as having the potential to occur in the affected Project quadrangles (Appendix C).

To identify the existing and potential biological resources present in the vicinity of the proposed Project, a Geographic Information System (GIS) search was performed. This consisted of mapping baseline biological resource data (vegetation mapping, CNDDB records, habitat conservation areas, water resources, and potential jurisdictional areas). The following US Geological Survey quadrangles were reviewed: McCoy Wash, Ripley, and Roosevelt Mine. Figure 2 shows the CNDDB records that were located within or adjacent to the project area.



Other references used included the soil data from the US Department of Agriculture, the Jepson Manual, the CNPS Inventory of Rare and Endangered Plants of California, and several other published and technical references for the region. By reviewing the surveys conducted by other projects in the area, POWER was able to determine where focused surveys may be required and where recently acquired existing data may be able to be used for a species inventory instead. The surrounding projects that were reviewed for existing survey information include:

- Blythe Solar Power Project (AECOM 2010)
- Genesis Solar Energy Project (BLM and CEC 2010, TetraTech 2010a, TetraTech 2010b)
- Devers-Palo Verde No. 2 Transmission Line Project (Aspen 2006)
- Devers-Palo Verde No. 2 Transmission Line Project Telecommunication System Route (CH2MHill 2010)
- Devers-Palo Verde No. 2 Transmission Line Project Colorado River Substation Expansion (Aspen 2011)
- First Solar Electric Blythe Solar 1 Project (First Solar Electric, LLC (First Solar). No Date)
- Blythe Airport Solar Project (US Solar Holdings, LLC (US Solar). No Date.)

These projects were reviewed for survey information, including target species, survey areas, survey dates, and survey results. This was conducted through a combination of textual reviews and reviews of project survey maps, when available. Based on these reports, the following information was acquired for focused surveys that have been conducted in the areas surrounding the BMSP. Refer to Table 1 for a complete analysis of the existing data that was collected. Figure 3 shows the existing data that overlaps with the Project's transmission line.

THIS PAGE INTENTIONALLY LEFT BLANK

FIGURE 2. CNDDB MAP

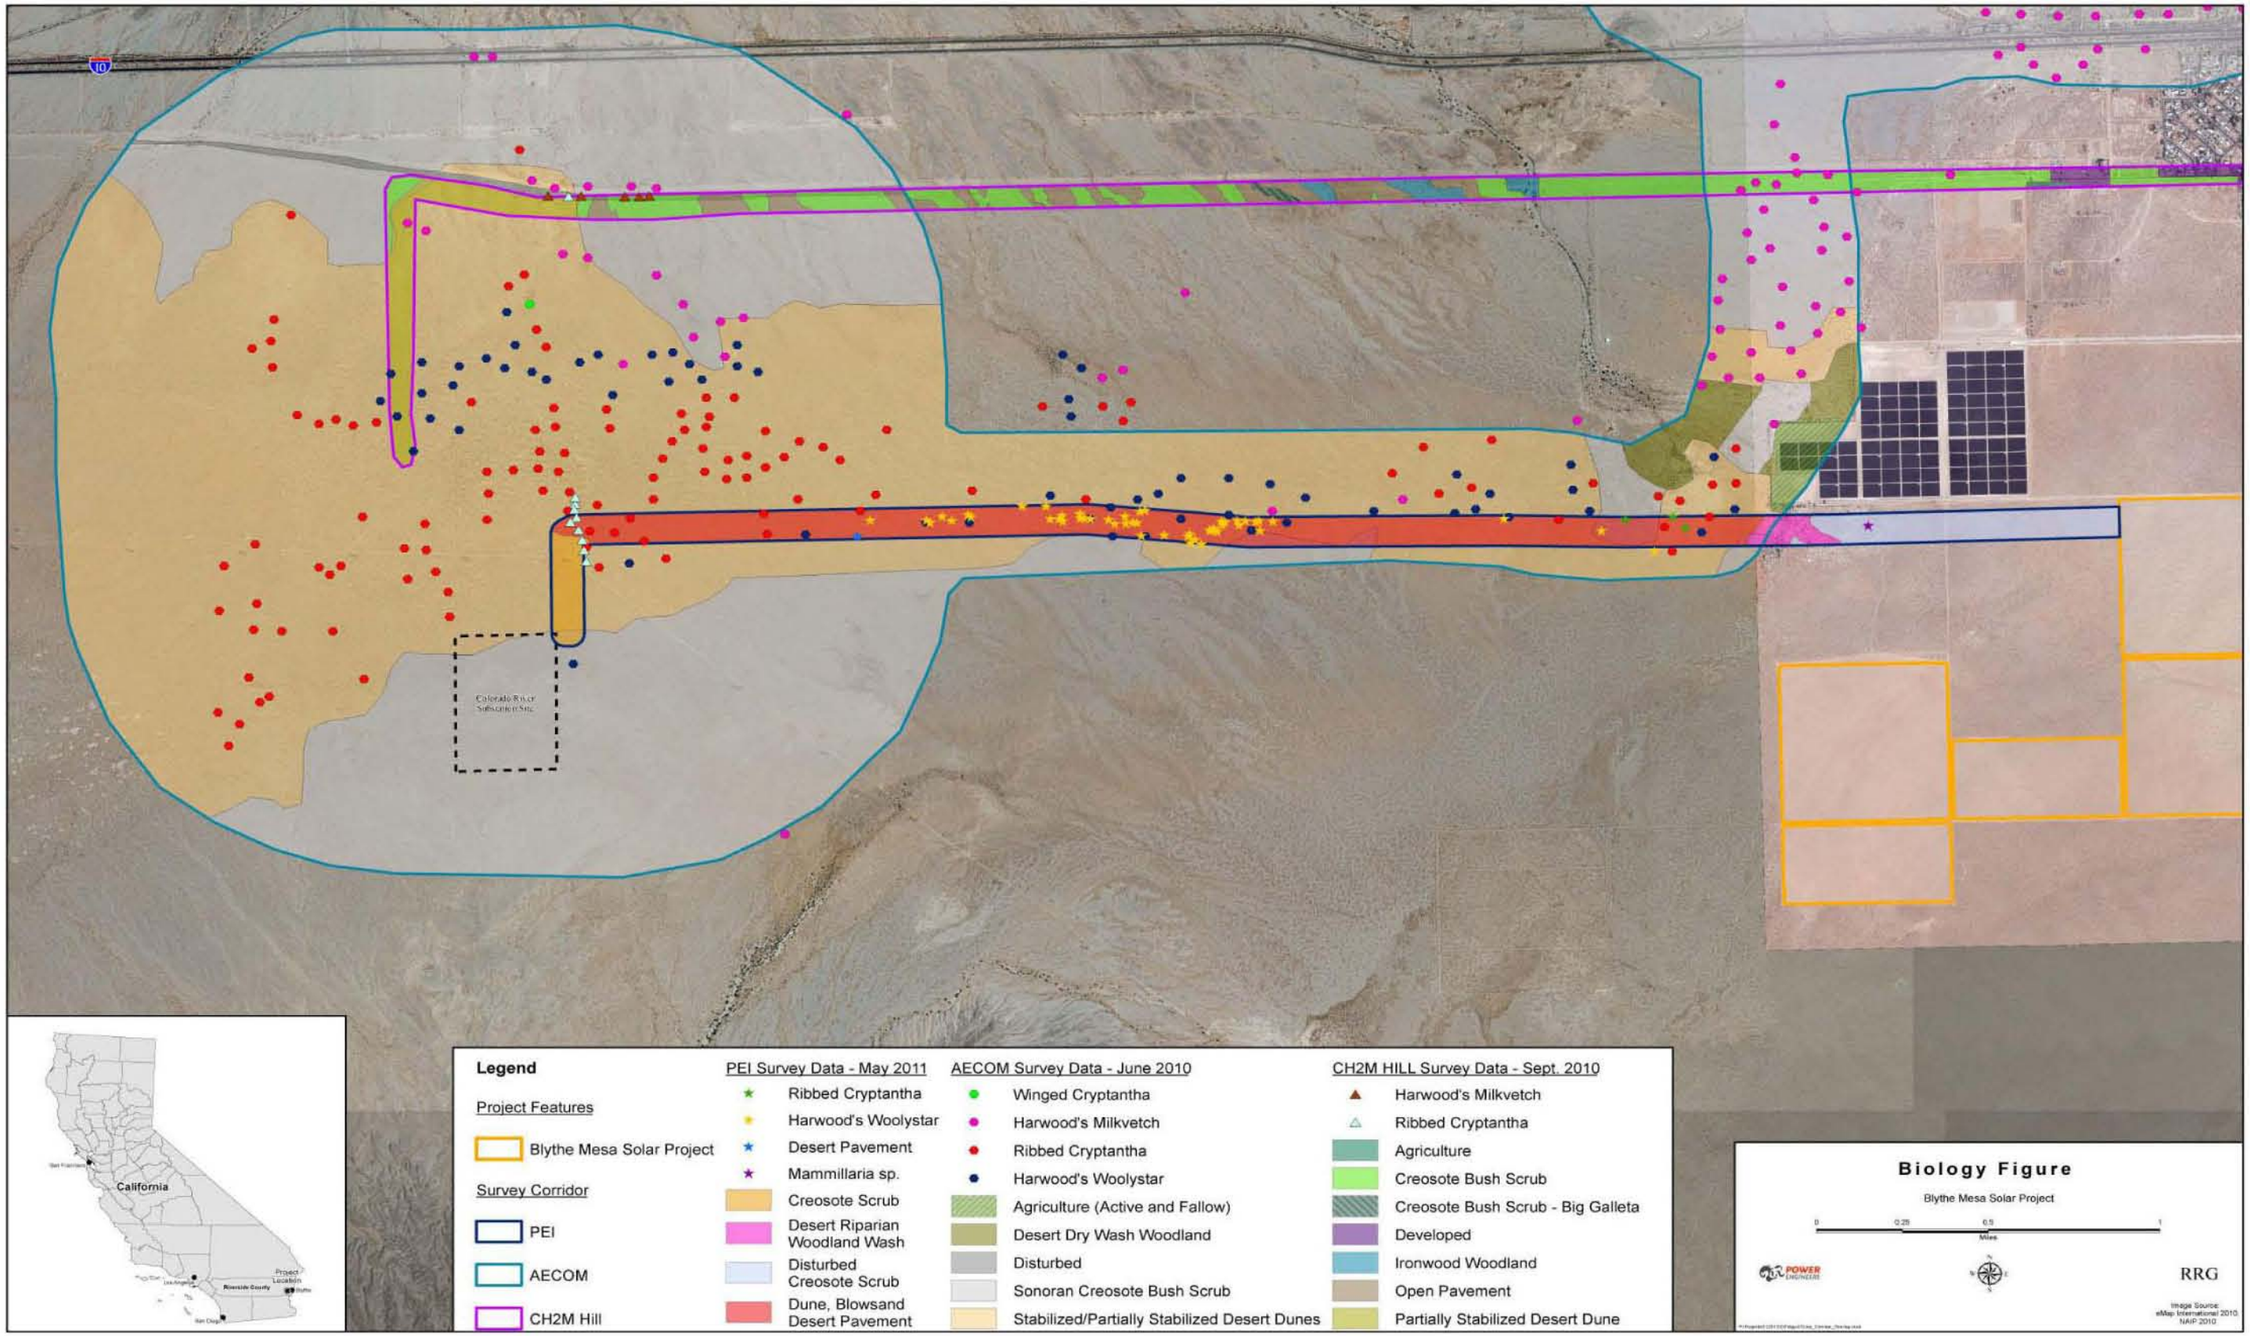
THIS PAGE INTENTIONALLY LEFT BLANK

TABLE 1. ADJACENT PROJECT SURVEY INFORMATION

Species	Project*	Species Detected	BMSP Survey Area Overlap
Burrowing Owl	Blythe Solar Power Project	Yes, two within solar site, four in transmission line and multiple sign. Not determined how sign was confirmed.	Overlaps with BMSP transmission line and Colorado River Substation (CRS) survey areas.
	Genesis Solar Energy Project	Yes, three individuals detected around the generation tie line and one burrow around the main site.	No overlap
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Burrow sites detected along project segment that encompasses Colorado River Substation, but specific locations not mapped.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, burrowing owls detected along southern telecom route. Three owls detected just east of Colorado River Substation.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.
Desert Tortoise	Blythe Solar Power Project	Yes, three to west side of project site with multiple sign (carcass fragment) on the remainder of the site. Sign detected in northern portion of transmission line. No sign detected within southern portion of transmission line (overlapping with BMSP).	Overlaps with BMSP transmission line and CRS survey areas.
	Genesis Solar Energy Project	Yes, sign detected within main site and generation tie line.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Detected in several project segments but not in the vicinity of BMSP.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, many sign (mostly scat) detected. Mainly scat detected around substation. Historical data of an adult and an occupied burrow.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.

Species	Project*	Species Detected	BMSP Survey Area Overlap
Golden Eagle	Blythe Solar Power Project	No, golden eagle active nests are not known within 10 miles of Blythe Solar site. One inactive nest in study area.	Overlaps with entire BMSP project area.
	Genesis Solar Energy Project	No.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	No.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	No.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.
Rare Plants	Blythe Solar Power Project	Yes. However, no federal or State protected species. Multiple species observed in project area. Multiple species observed in transmission line study area. Species observed in transmission line study area overlapping with BMSP include Harwood's milkvetch, Harwood's woollystar, winged cryptantha, and ribbed cryptantha.	Overlaps with BMSP transmission line and CRS survey areas.
	Genesis Solar Energy Project	Yes, numerous rare plants detected throughout entire project area. Species detected include ribbed cryptantha, Harwood's milkvetch, desert unicorn plant, winged cryptantha, and Harwood's woollystar.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	No State or federal listed species detected in the vicinity of BMSP.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, multiple species (no State or federal listed) detected. Ribbed cryptantha detected at overlap area near substation.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.

Species	Project*	Species Detected	BMSP Survey Area Overlap
Avian Use	Blythe Solar Power Project	Yes, various migratory and resident species observed.	Overlaps with BMSP transmission line and CRS survey areas.
	Genesis Solar Energy Project	Yes, various migratory and resident species observed.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Various special-status birds detected in project segment that encompasses CRS, but specific locations not mapped.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, various species detected in vicinity of substation.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	Yes, one special-status bird species detected.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.
Bat Risk	Blythe Solar Power Project	One instance of bat guano in main site. .	Overlaps with BMSP transmission line and CRS survey areas.
	Genesis Solar Energy Project	No.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	No.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	No.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	No.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.
Mojave Fringe-toed Lizard	Blythe Solar Power Project	Yes, multiple locations along transmission line	Overlaps with BMSP transmission line and CRS survey areas.
	Genesis Solar Energy Project	Yes, species detected abundantly throughout entire Project area.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Detected in project segment that encompasses Colorado River Substation, but specific locations not mapped.	The project areas overlap at the CRS.



Species	Project*	Species Detected	BMSP Survey Area Overlap
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, numerous individuals detected at and around the substation.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.
Sensitive Mammals (Badger, Kit Fox, Coyote)	Blythe Solar Power Project	Yes, numerous badger and kit fox sign. Several kit fox burrow complexes in northern transmission line.	Overlaps with BMSP transmission line and CRS survey areas.
	Genesis Solar Energy Project	Yes, kit fox and burro deer sign detected throughout project area.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	No.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, one badger skull and likely badger den detected.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.
Jurisdictional Waters	Blythe Solar Power Project	State waters delineated in main site, no waters delineated in transmission line or substation areas.	Overlaps with BMSP transmission line and CRS survey areas.
	Genesis Solar Energy Project	Yes, 91 acres of state jurisdictional waters within project area.	No overlap.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Potential jurisdictional waterways along project route noted but not mapped. No formal delineations conducted.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	No.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.

Species	Project*	Species Detected	BMSP Survey Area Overlap
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.

*See the project list above this table for reference information for each project.

FIGURE 3. EXISTING PROJECT DATA OVERLAP WITH BMSP STUDY AREA

THIS PAGE INTENTIONALLY LEFT BLANK

3.3 FIELD SURVEY METHODOLOGY

The following section describes the methodology used to collect biological data in the field. Field surveys were conducted to supplement the data collected from the review of existing data. During spring 2011, Project biologists completed the following surveys within the study area: vegetation mapping, reconnaissance surveys, focused rare plant surveys, and protocol burrowing owl surveys. Comprehensive biological resource survey methodologies were designed to meet applicable BLM, USFWS, and CDFG requirements.

3.3.1 Reconnaissance Survey

Biologists first developed a potential list of special-status species by consulting the CDFG California Natural Diversity Database (CNDDB) (RareFind Version 3.1.1; CDFG 2011) and California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants (2011) for documented occurrences of special-status or rare plants and animals within the McCoy Wash, Ripley, and Roosevelt Mine USGS 7.5-minute quadrangles (Figure 2). These resources, along with the species range maps, were utilized to determine historic occurrence of special-status plant and wildlife species and other natural resources within the study area. Additionally, USFWS was consulted regarding the federal listed species that could occur within the Project quads (Appendix C).

Once a complete list was developed of potential species that could occur within the Project area, POWER conducted a reconnaissance survey (refer to Tables 3 and 4 for species lists). The reconnaissance survey was conducted in the proposed solar array footprint by POWER biologists Tom Herzog and Ken McDonald on April 19 and 20, 2011. The survey was a comprehensive habitat assessment conducted across the whole site, identifying key habitat features for both flora and fauna.

Species-habitat correlations assume the occurrence of an organism with a series of environmental variables. Environmental variables can describe the habitat components organisms are dependent upon and, therefore, predict their pattern of habitat occupancy. Therefore, a habitat-based survey approach was used to assess the proposed Project footprint.

The field survey evaluated the quality of the habitat for each species and/or proximity of the habitat to a known occurrence of a species. Information used to determine known occurrence locations included CNDDB data, CNPS records, consultation with Wildlife Agencies, and reference to published species accounts. Field survey activities included documenting plant and animal species or sign observed within the study corridor, mapping vegetation communities, and photo-documenting existing biological conditions for all identified potential Project routes.

The potential for occurrence of special-status species not observed during field investigations was assessed based upon evaluation of species distribution and habitat use and information from previous research studies and biological reports. Therefore, based on the existing data and observations made during the field reconnaissance surveys, the following methodology was used to assess the following species.

Avian use: Numerous bird surveys have been completed by solar projects surrounding the Project area, including the Solar Millennium project (EDAW AECOM and Bloom Biological 2009). For the non-agricultural land within the Project area, information on late spring migrant songbirds and resident birds in native habitats (i.e., Sonoran creosote shrub scrub and desert dry wash woodland) is available (EDAW AECOM and Bloom Biological 2009).

Based on migratory bird data collected from adjacent projects, it was assumed that the agricultural land within the Project site may be used as foraging habitat (AECOM 2009). To the east of the Project area is the Lower Colorado River Valley. The Lower Colorado River Valley is in the Pacific Flyway, one of the

four major migration flyways in North America (Bird Nature 2001), and is a globally important bird area (IBA) (Audubon 2011). The IBA consists of the Colorado River, associated riparian areas and marshes, and agricultural fields in the area. Waterfowl are known to move daily between water bodies and irrigated agricultural fields to forage (Randall et al. 2011). The Project site comprises primarily irrigated orchard and non-irrigated field crops and fallow fields. However, approximately 90,000 acres of irrigated agricultural land is within the Palo Verde Valley just east of the Project area. Due to the existing suitable forage land east of the Project site and the distance from the Colorado River, it is assumed that migratory birds would only incidentally use the Project area for forage land and that these lands are of lesser value and importance for migratory bird foraging compared to lands closer to the River.

The Migratory Bird Treaty Act of 1918 (MBTA) is the main driver for protection of migratory birds in the United States. In the biological sense, a migratory bird is a bird that has a seasonal and somewhat predictable pattern of movement and includes some special-status species and more common species, as well. Based on the data reviewed and observations in the field, avian point count surveys were not conducted. Conducting a point count survey at this time would only provide a snapshot of the migratory species potentially using the site; the use by these species and numbers of species would vary widely each year. However, since it is expected that migratory species potentially use the Project site, preconstruction surveys are recommended. The purpose of the preconstruction survey is to avoid or minimize construction-related impacts on bird species that may be present or passing through the Project site. In addition, it is recommended that Best Management Practices be implemented prior to and during construction to further reduce and avoid construction-related impacts on bird species including nesting.

Bat risk: A reconnaissance survey was conducted to help determine the potential for bat species to occur within the Project area. Based on the results of the reconnaissance survey and lack of suitable habitat, no focused surveys were conducted or recommended.

Desert tortoise: Although desert tortoise was indicated as potentially occurring in the vicinity of the Project area, the only habitat initially deemed suitable occurred within the proposed transmission line corridor. During focused plant surveys, incidental observations of wildlife and wildlife sign were noted and no desert tortoise sign was detected. The habitat substrate was deemed too sandy for tortoise burrows, and vegetation was only marginally suitable to support tortoise foraging. Meetings with regulatory agencies confirmed that this area, and any of the other land within the proposed Project area, is unlikely to support desert tortoise; therefore, no protocol surveys are considered necessary. A preconstruction survey should be conducted. If desert tortoises are not observed during the preconstruction surveys, additional conservation measures will not be needed.

Golden eagle: Research conducted, including mapping of CNDDB records, shows that Golden eagle active nests are not located within 10 miles of the Project site. Existing data and reports from the Blythe Solar Power Project (AECOM 2010) also indicated no Golden eagles within 10 miles of their project site. Based on the existing records and the reconnaissance survey, no further survey is proposed for the Project.

Mojave fringe-toed lizard: During the spring rare plant survey, POWER recorded approximately 100 observations of Mojave fringe-toed lizard along the transmission line survey area. Based on the known presence of the species, focused surveys are not proposed for this species. Mitigation measures should be developed to avoid, minimize and mitigate impacts to the Mojave fringe-toed lizard.

American Badger and Desert Kit Fox: Based on the surrounding project survey results and no small mammal records within CNDDB, no additional surveys are proposed. A preconstruction clearance survey should be conducted to help identify and avoid any potential species that may be present within the Project footprint.

Bighorn Sheep: A bighorn sheep skull was found within the proposed solar array project footprint. It is unknown how long this skull had been here and if the animal died near this location, or if the skull was washed downstream from somewhere else. Focused surveys for this species were not conducted and this sign was noted incidentally during the reconnaissance surveys.

Jurisdictional waters: Based on delineations conducted for the Blythe Solar Power Project (AECOM 2010) and the Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route (CH2MHill 2010), review of watershed maps and inventories, and observations during field surveys, no jurisdictional waters are believed to be present within the Project area. No delineations are proposed.

3.3.2 Vegetation Communities

Vegetation mapping was conducted within the study area during April and May, 2011. Aerial photography and Project maps were utilized and vegetation community boundaries were recorded. Because most of the solar array footprint is agricultural, intensive ground surveys were not necessary for vegetation mapping. The transmission line footprint, which mostly comprises creosote bush scrub, was surveyed on foot, allowing more precise recording of habitat changes within the proposed corridor

3.3.3 Focused Rare Plant Survey

Based on observations made during the reconnaissance survey, a focused rare plant survey was conducted within a 500-foot corridor around the proposed transmission line on May 5 and May 6, 2011 by POWER biologists Ken McDonald, Melissa Lippincott, Tom Herzog, and Ryan Winkleman. The surveys were floristic, meaning that all plants observed were identified to the taxonomic level needed to determine whether they were special-status plant species. Exceptions to this included instances where characteristics essential for identification were not present during the field survey period. Botanists identified all plant species detected during field surveys using personal knowledge of the plants and keys in *The Jepson Manual* (Hickman 1993). Scientific nomenclature in this report mainly follows Hickman (1993). Common names are derived from Hickman (1993) and CalFlora (2008). The survey methodology generally followed the U.S. Fish and Wildlife Service's (USFWS) *Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants* (USFWS 1996a), and the recommended botanical survey guidelines of the California Department of Fish and Game (CDFG 2000) and the California Native Plant Society (CNPS 2001).

Prior to going into the field, a list of potentially occurring sensitive plant species was compiled based on species information with known populations within/near the study area and results of the reconnaissance survey (refer to Table 3). POWER botanists prepared photographs and habitat descriptions for each potential special-status plant species prior to the surveys and trained the other biologists in their detection. Biologists walked approximately 30 feet apart in parallel transects on both sides of the proposed transmission centerline. The biologists all studied the first instances of special-status plants that were observed to obtain a survey image of the plants' current appearances. The survey was floristic in nature, in that each species of plant detected was either identified and recorded in the field to species level, or collected for later identification using standard taxonomic floral keys.

Wildlife sign and sightings were also recorded and special-status wildlife species incidentally observed during the plant surveys were mapped using global positioning system (GPS) units.

3.3.4 Protocol Western Burrowing Owl Survey

Protocol surveys were started on May 6 and extended through July 23, 2011. Survey methods were derived from generally accepted professional standards, the 1993 California Burrowing Owl Consortium (CBOC) Burrowing Owl Survey Protocol and Mitigation Guidelines (CBOC 1993), and the 1995

California Department of Fish and Game (CDFG) Staff Report on Burrowing Owl Mitigation (CDFG 1995). In summary, a methodical pedestrian survey for owl burrows was conducted by walking through areas of suitable habitat within the study area, including man-made structures.

POWER biologists Tom Herzog, Steve Hicks, Ken McDonald, Melissa Lippincott, and Garcia and Associates, Inc. biologists Andrew McCadden, Angelique Herman, and Laura Megill conducted pedestrian survey transects, spaced at approximately 100 feet to allow for 100% visual coverage of the study area. Where necessary, transect spacing was reduced or expanded to account for differences in terrain, vegetation density, and visibility. The locations of all potential owl burrows and sign were recorded and mapped using handheld global positioning devices and aerial imagery. Incidental observations of other avian species, plants and other wildlife were also noted. The presence of each observed wildlife species was based on direct observation of individual(s), sign, and/or vocalization. CBOC survey protocols and POWER's full methodology and results are described in the burrowing owl survey report (POWER 2011).

4.0 AFFECTED ENVIRONMENT

The results of the literature review, records search, GIS analysis, and field data are provided below.

4.1 ENVIRONMENTAL SETTING

The Project area is in the Palo Verde Valley, along the western edge of the Colorado River in the Sonoran Desert. This area is on Palo Verde Mesa, a series of ancient raised river terraces. The topography is relatively flat and slopes toward the southeast; elevations range from 260 to 400 feet above mean sea level (AMSL). The Project area is near the Big Maria Mountains on the northwest, the McCoy Mountains on the west, the Mule Mountains on the southwest, and the Colorado River on the east. These mountain ranges, trending northwest to southeast, create a natural barrier between the Colorado River and the greater Colorado Desert. Development in the Project vicinity includes agricultural fields and groves as well as the Blythe City Airport. The Project area also includes undeveloped open desert.

The subtropical climate of the Colorado Desert is characterized by dry, mild winters averaging 54 degrees Fahrenheit (°F) and dry, hot summers that average 90°F. Summer highs are known to reach 122°F. Yearly average precipitation is 3.83 inches (Western Regional Climate Center, 2011). Although rainfall is primarily in the winter months, the region is influenced by summer monsoons from July through September.

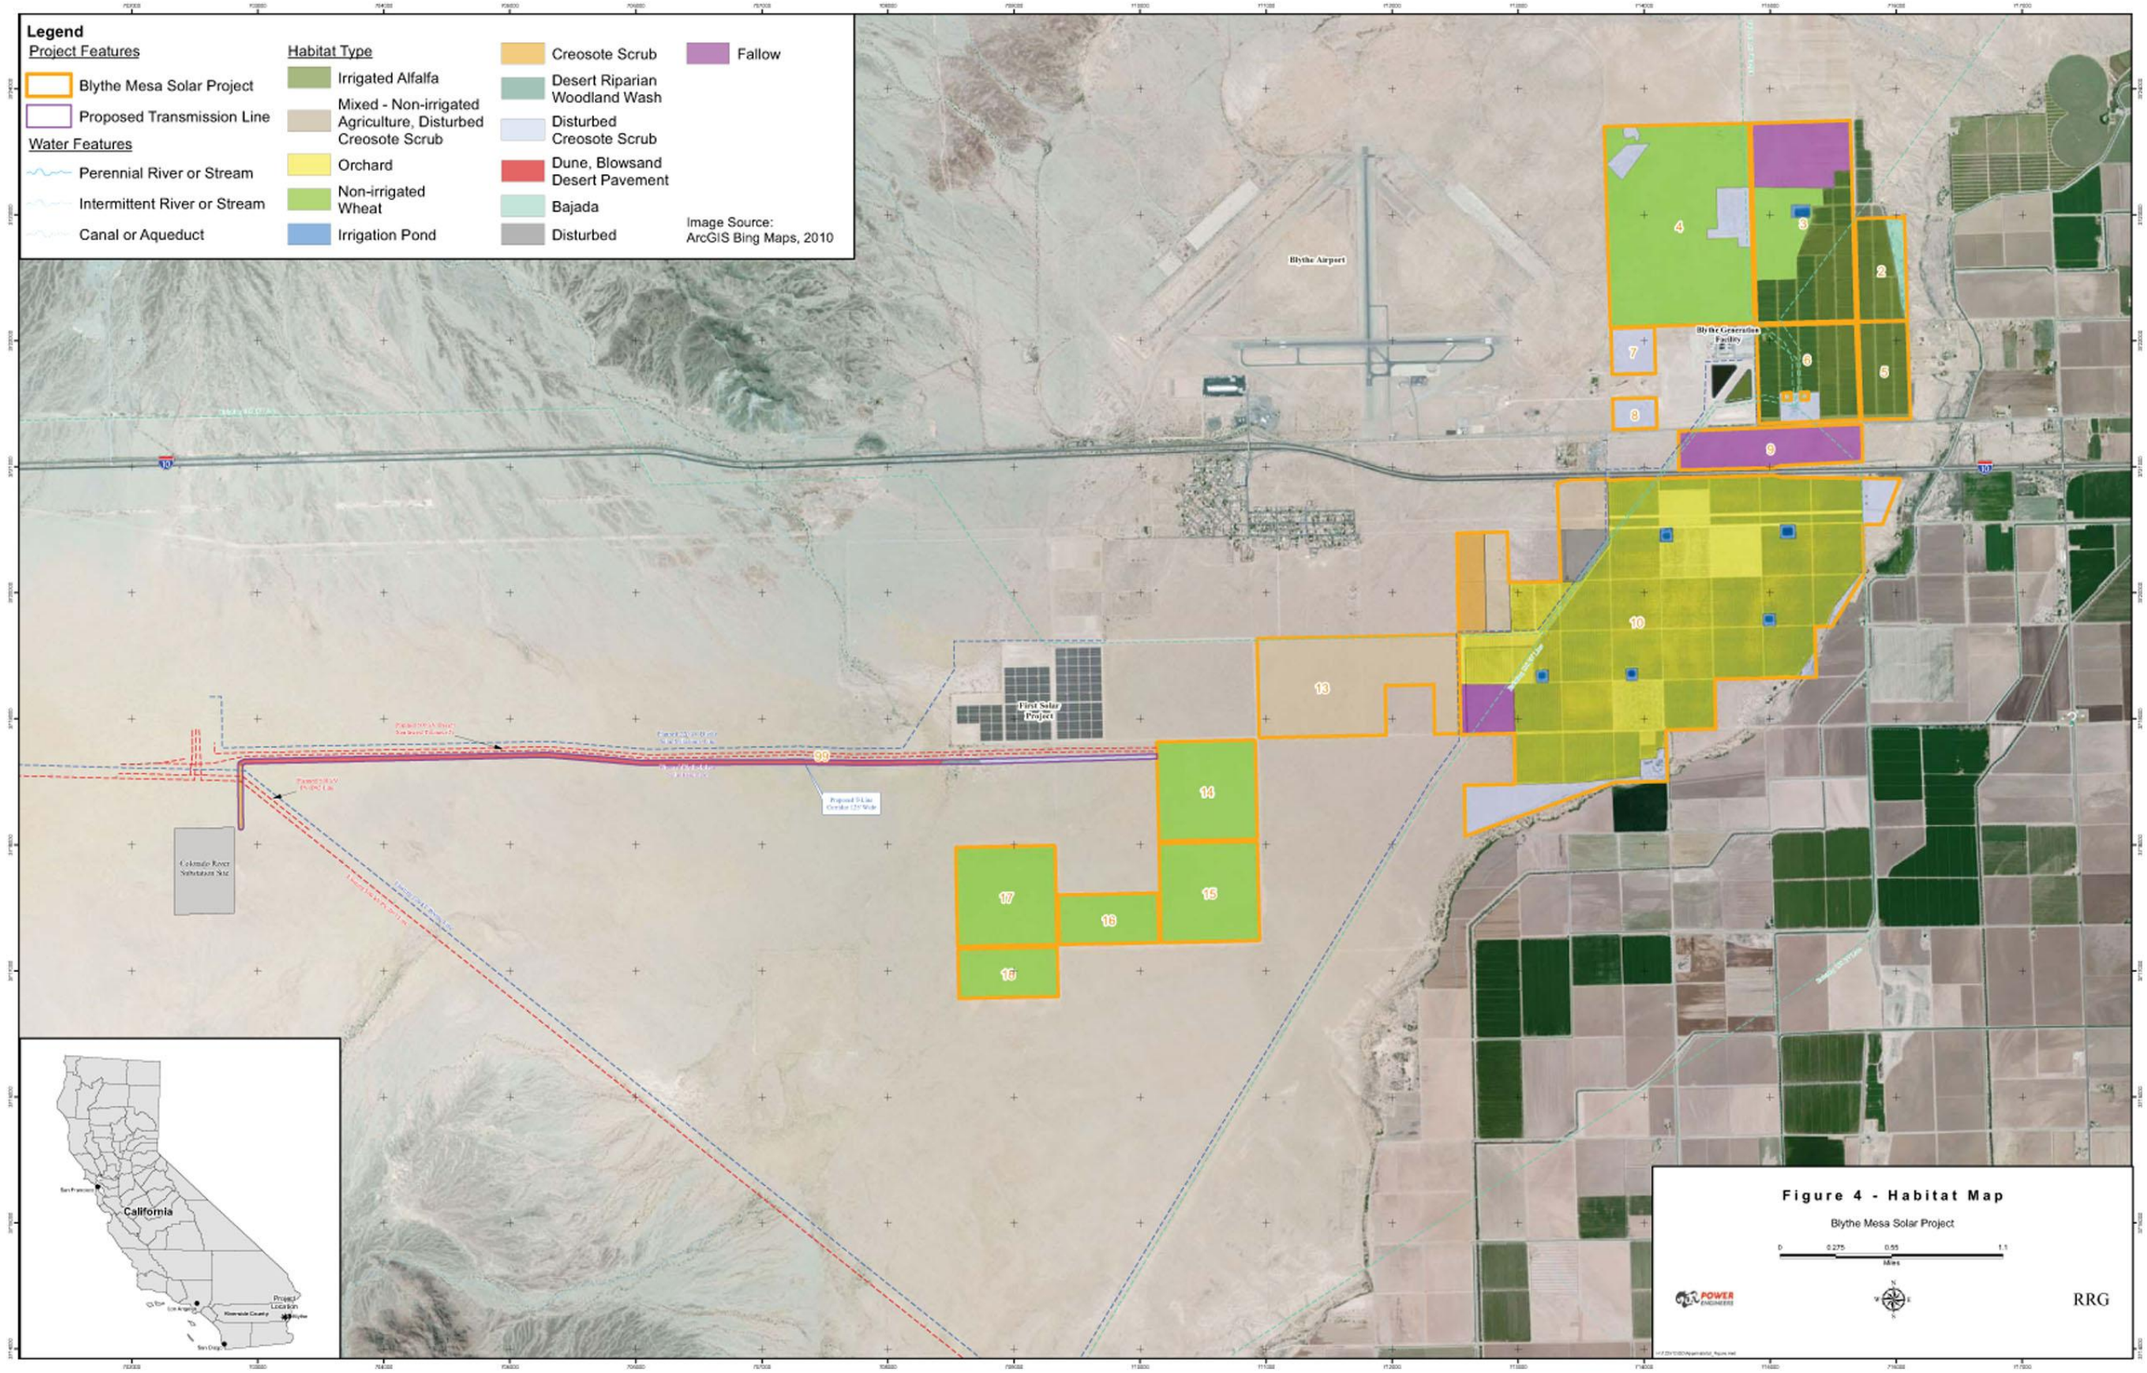
Surface water is minimal on Palo Verde Mesa, limited to seasonal and perennial sources. Perennial water comes from McCoy Springs in the McCoy Mountains west of the Project area and the Colorado River, which lies eight miles east of the Project area. The Colorado River is the source of irrigation water for agriculture in the area.

Vegetation communities within the Project area consisted of Creosote Bush Scrub, Desert Dunes, Desert Dry Wash Woodland, and Agricultural Land. Creosote bush (*Larrea tridentata)* was the dominant plant species in creosote bush scrub communities and was co-dominant with big galleta grass (*Pleuraphis rigida*) and indigo bush (*Psorothamnus emoryi*) in desert dune communities. Palo verde (*Cercidium floridum*), mesquite (*Prosopis* spp.), ironwood (*Olneya tesota*) and smoketree (*Psorothamnus spinosus*) occurred within Desert Dry Wash Woodland. Agricultural land use within the Project area included drip-irrigated citrus orchards, flood-irrigated alfalfa, non-irrigated winter wheat, abandoned jojoba orchards, and fallow fields. Approximately 70% of the Project area was actively cultivated agricultural land, 24% was previously disturbed by agricultural or military activities, and approximately 6% remained undisturbed.

The Project area borders or is in the vicinity of Nicholls Warm Springs/Mesa Verde, solar array facilities, Blythe Airport, the 520 MW natural gas-fired Blythe Generating Plant, electrical substations, electrical transmission lines, Interstate 10 (I-10), and other paved and dirt roads. The Project area is bound on the east by agricultural land use that extends to the Colorado River. Beyond the urban disturbances immediately adjacent, the Project area is bound on the other three compass bearings by undeveloped native desert habitat.

Wildlife species commonly observed within the Project area included round-tailed ground squirrel (*Spermophilus tereticaudus*), kangaroo rat (*Dipodomys* sp.), kit fox (*Vulpes macrotis*), desert cottontail (*Sylvilagus audubonii*), black-tailed jackrabbit (*Lepus californicus*), coyote (*Canis latrans*), mourning dove (*Zenaida macroura*), white-wing dove (*Zenaida asiatica*), horned lark (*Eremophila alpestris*), greater roadrunner (*Geococcyx californianus*), Le Conte's thrasher (*Toxostoma lecontei*), western kingbird (*Tyrannus verticalis*), loggerhead shrike (*Lanius ludovicianus*), common zebra-tailed lizard (*Callisaurus draconoides draconoides*), desert iguana (*Dipsosaurus dorsalis*), common side-blotched lizard (*Uta stansburiana*), Mohave fringe-toed lizard (*Uma scoparia*), western diamondback (*Crotalus atrox*), and western whiptail (*Cnemidophorus tigris*).

4.1.1 Vegetation Communities



Eleven vegetation communities and other cover types were identified within the study area during the reconnaissance and focused surveys, including upland, riparian, and other cover types (Table 2; Figure 4). Vegetation communities are described in detail below and based on a classification system by R. Holland (1986). When appropriate, vegetation classification by J.O. Sawyer and T. Keeler-Wolf (1995) are also considered. Community types according to CDFG are listed where applicable. Of the vegetation communities listed in Table 2, desert riparian woodland wash is considered sensitive. Desert riparian woodland wash is sensitive because it is included with State waters under the jurisdiction of CDFG. In addition, desert riparian woodland wash is a special community type (e.g., high priority for inventory in the California Natural Diversity Database) per CDFG's Vegetation and Mapping Program.

TABLE 2. VEGETATION COMMUNITIES AND COVER TYPES (ACRES)

Vegetation Communities and Other Cover Types	Acreage
Desert Riparian Woodland Wash	2.83 acres
Creosote Scrub	4.80 acres
Dune, Blowsand Desert Pavement	52.52 acres
Bajada	18.07 acres
Disturbed Creosote Scrub	122.27 acres
Disturbed Creosote Scrub and Fallow Agriculture	720.61 acres
Irrigated Cropland	404.02 acres
Irrigation Pond	13.34 acres
Orchard	1299.49 acres
Row Crop	863.18 acres
Ruderal	171.82 acres
	(wildlife forage)

THIS PAGE INTENTIONALLY LEFT BLANK

Desert Riparian Woodland Wash. This vegetation community consists of open, drought deciduous, riparian scrub woodland and is made up of three primary components: wash-dependent vegetation, vegetated ephemeral dry wash, and islands of Sonoran creosote bush scrub (e.g., riparian interfluves). Dominant and indicator plants of this community within the study area include honey mesquite (*Prosopis glandulosa*), palo verde (*Cercidium floridum*), desert ironwood (*Olneya tesota*), cat-claw acacia (*Acacia greggii*), and rush milkweed (*Asclepias subulata*). Creosote bush (*Larrea tridentata*) and burro brush (*Ambrosia dumosa*) were scattered throughout the canopy. The herbaceous layer was dominated by desert plantain (*Plantago ovata*), *Cryptantha* spp., and Mediterranean grass (*Schismus barbatus*). Desert riparian woodland wash is equivalent to Holland's desert dry wash woodland (Code 62200). It also approximates Sawyer and Keeler-Wolf's Catclaw Acacia Series.

Approximately 2.83 acres of desert riparian woodland wash occurs in the Project area, all located within the proposed transmission line disturbance area.

Creosote Bush. Within the study area, this community is characterized by sandy soils with a shallow clay pan on a broad gentle southeast trending slope. Dominant plants within the study area for this community include creosote bush, burro brush, brittlebush (*Encelia farinosa*), and cheesebush. This is the most common plant community within the study area, dominating the alluvial soil deposits. This plant community intergrades into the desert dry wash woodland. Within the study area, there are areas of desert pavement that are covered with rounded cobbles that range in size from one to three inches. Typically, these areas are higher than the surrounding landscape by three to 15 feet. These areas are within Sonoran creosote bush scrub, though the plant density is lower. Sonoran creosote bush scrub is designated by Holland as Code 33100 and Sawyer and Keeler-Wolf as the Ocotillo Series.

Within the utility corridor on the south side of I-10, fine sand drifts are interspersed within this community type. In these areas, Emory's indigo bush occurs in stands and was more prevalent than in other portions of the Sonoran creosote bush scrub.

Approximately 4.80 acres of relatively undisturbed Sonoran creosote bush scrub occurs within the Project area. This is present within the proposed transmission line disturbance area and is relatively undisturbed, except for occasional vehicle tracks. There are larger blocks of disturbed creosote bush scrub in the solar array disturbance area. Past disturbances in these areas consist of military training and agricultural use, including cultivation of jojoba (*Simmondsia chinensis*). These disturbances occurred in the past and the Sonoran creosote bush scrub within the study area has been recovering through natural recruitment. As a result, two invasive plant species, Russian thistle (*Salsola tragus*) and Sahara mustard (*Brassica tournefortii*), can be found in disturbed areas throughout the study area, especially near roads, and fallow and active agricultural areas. Another exotic plant, Mediterranean grass (*Schismus* sp.), is prevalent throughout the Sonoran creosote bush scrub. There are approximately 122.27 acres of disturbed creosote bush scrub within the Project area and an additional 720.61 acres of disturbed creosote bush scrub that is growing in fallow agricultural fields.

Dunes, Blowsand Desert Pavement. This community is characterized by sand that is locally stabilized by evergreen and/or deciduous shrubs, scattered low annuals, and perennial grasses, and that therefore is an actively changing part of the desert environment. Desert pavement is generally more stabilized and is covered with rock fragments to resemble a "pavement" surface. This group of communities was present throughout most of the proposed transmission line disturbance area. This community most closely resembles Holland's "Desert Dunes" community, designated by Holland as Code 22000.

Approximately 52.52 acres of dunes and blowsand desert pavement are present within the Project area.

Irrigated Cropland, Irrigation Pond, Orchard, and Row Crop. These community types fall into the broader category of agriculture. The majority of agricultural land is fallow and active agriculture within

the proposed solar array disturbance area. It includes lands that are currently under cultivation and those that are abandoned (e.g., fallow). In the soils within abandoned agriculture areas, native vegetation is growing back; Russian thistle, Saharan mustard, and other exotic plants were observed interspersed with the native vegetation and are indicative of past agricultural disturbance. Irrigated cropland encompasses approximately 404.02 acres within the Project area, while irrigation ponds are 13.34 acres, orchards are 1,299.49 acres, and row crops are 863.18 acres. There is no associated Holland or Sawyer and Keeler-Wolf classification for this land cover type.

Bajada. Bajadas are essentially alluvial fans or desert washes. This community is present in the northeastern corner of the Project area and is typically characterized as the shallow, sandy, braided bottoms of wide canyons. Although much of this community is sparsely vegetated, it most closely resembles Holland's "Mojave Desert Wash Scrub," Code 63700.

Approximately 60.03 acres of bajada are present within the Project area.

Ruderal. Ruderal communities have been previously disturbed and have been converted to mostly non-native, weedy areas. Ruderal vegetation is that which grows quickly in disturbed areas and may consist of native species, such as fire-following plants, or non-native species, such as invasive grasses or forbs. Examples of invasive species that would occur in these areas include redstem filaree (*Erodium cicutarium*), Sahara mustard, and Mediterranean grass. Ruderal areas in the Project area are primarily concentrated within the proposed solar array area.

Approximately 219.83 acres of ruderal vegetation is present within the Project area.

4.1.2 Jurisdictional Waters

Delineation surveys conducted for the Blythe Solar Power Project, which overlaps the BMSP transmission line corridor, did not identify any jurisdictional waters within the overlapping area (AECOM 2010). Additionally, delineation surveys conducted for the Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route, which runs parallel to the BMSP transmission line corridor and is approximately one mile north and in the same hydrological flow route, did not identify the presence of jurisdictional waters within the area of the BMSP transmission line corridor (CH2MHill 2010). There is an agricultural irrigation ditch running close to the eastern edge of the proposed solar array, but it does not cross the Project area and is approximately 75 to 90 feet below the edge of the Project area. There are several palustrine open-water wetlands (POWs), likely stock ponds, located in a block in an area that is surrounded by the Project east of the Blythe Airport and north of I-10, but there are no POWs within the Project boundaries.

Through field reconnaissance surveys and analyses of National Wetlands Inventory (NWI) and watershed data, it is unlikely that there are any jurisdictional waters of the U.S. within the Project area. It is anticipated that USACE will not assert jurisdiction over any waters and/or aquatic features occurring within the disturbance area.

4.1.3 Flora

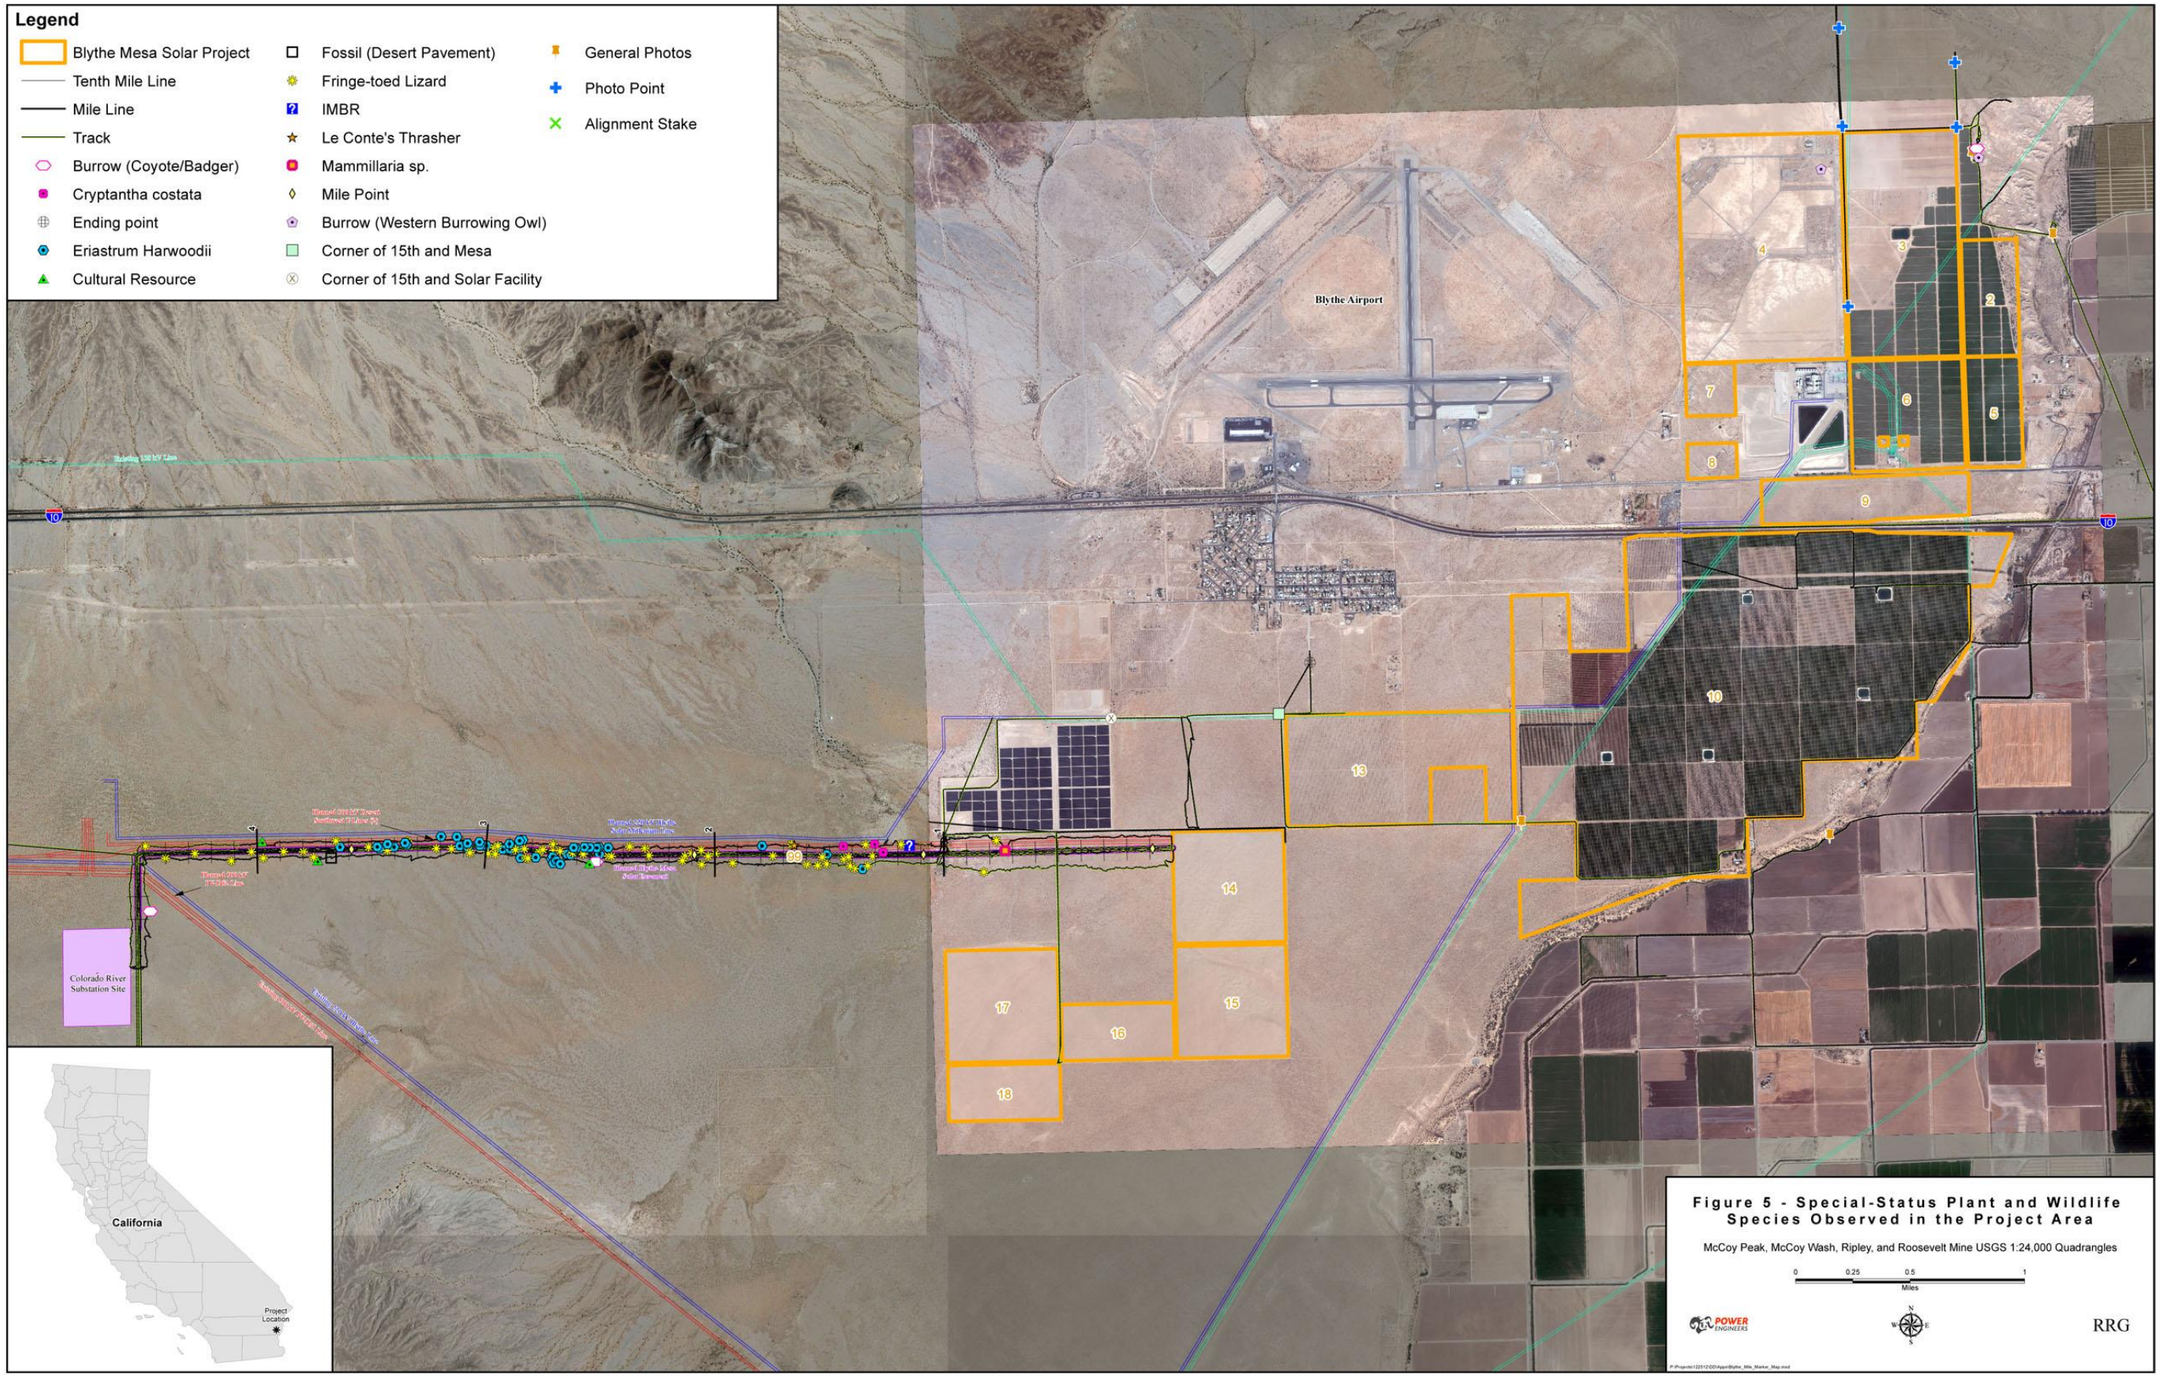
This section discusses plant species detected or with potential to occur within the study area. In total, 79 plant species were detected in the study area during vegetation mapping and rare plant surveys, including 15 non-native plant species (Appendix A). A total of 18 special-status plant species have potential to occur within the study area (Table 3). Harwood's woollystar (*Eriastrum sparsiflorum* ssp. *harwoodii*) and desert unicorn (*Proboscidea althaeifolia*) were observed within the study area. Harwood's woollystar, a CNPS List 1B.2 (rare, threatened, or endangered in California and elsewhere) species, was detected in the transmission line footprint and in the buffer, while desert unicorn plant, a CNPS List 4.3 (limited distribution, not very endangered in California) species, was detected in the solar array area. No other

federal-listed, State-listed, or other special-status plant species was observed within the study area. More detail on special-status species that occur or have the potential to occur within the study area is provided in Table 5.

Plant species observed during the individual reconnaissance and focused surveys are listed in Appendix A. Species most commonly observed during biological surveys included burro bush, Sahara mustard, creosote bush, and galleta grass (*Pleuraphis rigida*). Other common species that occurred less frequently included desert pincushion (*Chaenactis stevioides*), Spanish needles (*Palafoxia arida*), several *Cryptantha* species, four-wing saltbush (*Atriplex canescens*), Russian thistle, palo verde, and bottlebrush primrose (*Camissonia boothii*).

Species accounts are provided below for the special-status plant species that could occur within the Project area. This includes both species that were and were not detected during surveys. These species are based on records searches with the CNDDB (CDFG 2011) and CNPS (2011), and reviews of documentation from other nearby projects, such as the Blythe Solar Power Project (AECOM 2010).

Federal Listed Plant Species. No federal-listed plant species were detected within the study area during spring 2011. Based on a CNDDB search, no federal endangered plant species have potential to occur within the study area.



State-listed Plant Species. Based on regional databases, no State-listed plant species were determined to have potential to occur within the study area. Based on site-specific habitat evaluations conducted by Project biologists and a literature review, including a CNDDB record search and a compiled list, it was determined that no State-listed plant species have been recorded near the study area or have potential to occur in the study area. No State-listed plant species were detected within the study area.

Other Special-Status Plant Species. Harwood's woollystar was observed within the study area. Harwood's woollystar, a CNPS List 1B.2 (rare, threatened, or endangered in California and elsewhere) species, was detected in the transmission line Project area and in the buffer. Forty-nine individuals were observed in flower within the survey area. These individuals are displayed as point locations on Figure 5. Based on a CNDDB search, Harwood's milk-vetch (*Astragalus insularis* var. *harwoodii*), a CNDDB List 2.2 species, has a high potential to occur within the proposed transmission line disturbance area. There are numerous records in the vicinity and several that are just outside the survey buffer area.

Species accounts are provided below for special-status plant species that occur or have potential to occur in the Project area. Table 3 provides a summary of the special-status plant species with the potential to occur within the Project area.

THIS PAGE INTENTIONALLY LEFT BLANK

FIGURE 5. SPECIAL-STATUS PLANT AND WILDLIFE SPECIES OBSERVED IN THE PROJECT AREA

THIS PAGE INTENTIONALLY LEFT BLANK

Special-Status Plant Species Accounts

Angel Trumpet

Angel trumpet (*Acleisanthes longiflora*) is a thick-taprooted perennial herb in the *Nyctaginaceae* family. Angel trumpet is a CNPS list 2.3 species, meaning that it is rare, threatened or endangered in California. It occurs in carbonate soils within Sonoran Desert creosote bush scrub from 30 to 8,000 feet and flowers during May (Jepson Interchange 2011, CNPS 2011). This species is known from only one occurrence in California in eastern Riverside County near the southern edge of Big Maria Mountain, North of Blythe and north east of the Project area (CalFlora 2011).

Soils in the majority of the Project area are composed of sandy decomposed granite. Potentially suitable habitat for angel trumpet could occur in the northeast corner of the site in the Bajada vegetation area. However, based on soils in the Project area and known records for this species, there is low potential for it to occur within the Project area. Furthermore, angel trumpet was not observed during focused surveys conducted within the appropriate blooming period for this species.

Coachella Valley Milkvetch

Coachella valley milkvetch (*Astragalus lentiginosus* var. *coachellae*) is federally listed as an endangered species, is a BLM sensitive species, and is included in the CNPS Inventory of Rare and Endangered Plants on list 1B.2. It is also covered under the Coachella Valley Multiple Species Habitat Conservation Plan (CVMSHCP). Coachella Valley milkvetch is an annual or perennial herb historically known to occur in Sonoran Desert scrub in sandy soils at elevations ranging from 131 to 2,149 feet (CNPS 2011). Coachella Valley milkvetch blooms from February to May. There are 81 recorded occurrences for this species in Riverside County. Coachella Valley milkvetch is known to occur in the Coachella Valley; the record nearest the Project area is east of Victory Pass, approximately five miles north of Desert Center along State Highway 177, approximately 49 miles west of the Project area (CalFlora 2011).

Suitable Sonoran Desert scrub with sandy soils occurs throughout the Project area. Coachella Valley milkvetch was not observed during focused surveys conducted within the blooming period (surveys were conducted May 4 and 5, 2011).

Harwood's Milk-vetch

Harwood's milk-vetch (*Astragalus insularis* var. *harwoodii*) is a CNPS 2.2 species, meaning that is it fairly threatened in California. It is also a covered species under the NECO Plan. It mainly occurs in Sonoran desert scrub habitat throughout the Colorado Desert (BLM 2002). This species is found in desert dunes and sandy or gravelly areas throughout the Mojavean and Sonoran Deserts covering portions of Imperial, Riverside, and San Diego counties (CNPS 2011). There are known occurrences of this species from Elephant Tree Nature Trail in San Diego County and Carrizo Station. Herbarium collections occur for this species from Ogilby Road in Imperial County and three locales west of Blythe, the Pinto Basin, and Chuckwalla Basin in Riverside County. Harwood's milk-vetch has also been reported from Baja California, Sonora Mexico, and portions of Yuma County, Arizona (Reiser 1994). There are several CNDDB records for this species outside of the Project area (CNDDB 2010) within a 10-mile radius. There is a record in the Consortium of California Herbaria database from Wiley's Well Road between McCoy and Mule Mountains from 400 feet elevation (CCH 2010). The Harwood's milk-vetch populations on the southern deserts are presumed stable given limited disturbance to their desert habitats (Reiser 1994).

Harwood's milk-vetch was not found within the Project area, although it is known to occur just north of the proposed transmission line (CNDDB 2011). Suitable habitat for this species occurred along the proposed transmission line corridor in the southern portion of the study area.

Pink Fairyduster

Fairyduster (*Calliandra eriophylla*) is a deciduous, perennial subshrub in the *Fabaceae* family. Pink fairyduster is a CNPS List 2.3 species (rare, threatened or endangered in California) inhabiting sandy washes, slopes and mesas in the Sonoran Desert from 390 to 5,000 feet elevation and blooms from March to April (CNPS 2011) but may flower from January to March depending on site and seasonal rainfall (Jepson Interchange 2011). There are 12 records of pink fairyduster in San Diego County west of Blythe, southwest of McCoy Mountain, north, west and south of Mule Mountain, and north of Black Hill. The closest record of this species occurs approximately 10 miles from the Project area (CalFlora 2011).

Although suitable habitat occurs within the desert riparian woodland wash along the proposed transmission line and in the northeast Bajada portion of the site, pink fairyduster was not observed during surveys conducted in May. Surveys were conducted outside of the blooming period for this species.

Crucifixion Thorn

Crucifixion thorn (*Castela emoryi*) is a CNPS List 2.3 deciduous shrub in the *Simaroubaceae* family. This species blooms from April through May and is known to occur in gravelly soils in Mojave and Sonoran Desert scrub, and playas at elevations ranging from 295 to 2,198 feet (CNPS 2011). The nearest recorded occurrence of this species is along the Bradshaw Trail, 2.5 miles west of Wiley's Well Camp, approximately 12 miles south west of the Project area (CalFlora 2011).

Crucifixion thorn was not observed during surveys conducted during the appropriate blooming period. Furthermore, this large, obvious shrub would be difficult to miss while conducting walking transects during focused surveys. This species does not occur at the Project site.

Abram's Spurge

Abram's spurge (*Chamaesyce platysperma*) is a CNPS List 2.2 species, meaning it is fairly rare in California but more common elsewhere (CNPS 2011). Habitat consists of sandy flats in creosote bush scrub habitat from approximately 600 to 2,700 feet above mean sea level. Based on fourteen Consortium of California Herbaria database records for this species, habitats in Riverside, San Diego, and Imperial counties consist of sandy soil habitats often along dry lake margins, whereas record locations in San Bernardino County occur on coarser, possibly sandy loams.

Abram's spurge occurs from San Bernardino County to Imperial and eastern San Diego counties to Arizona, Nevada, Mexico, and Baja California (GSEP 2009f). A recent 2000 CNDDB record is from a location approximately 0.50 mile east of Ford Dry Lake on Gasline Road just south of I-10, and the occurrence was reported as a "substantial population" (CNDDB 2010).

The blooming period is identified by CNPS as September through November (CNPS 2011).

Abram's spurge is a late-summer, early-fall blooming plant species and was therefore not targeted or detectable during field surveys, which were performed during May 2011. Suitable habitat for this species is present along the proposed transmission line, in the Bajada area in the northeast corner of the Project site, and within intact creosote scrub throughout the Project area. Focused surveys for this species should be conducted during the appropriate blooming period.

Flat-seeded Spurge

Flat-seeded Spurge (*Chamaesyce platysperma*) is an annual, prostrate herb that blooms from February to September but typically in May (CNPS 2011). This is a CNPS list 1B.2 species. Flat-seeded Spurge occurs in the Sonoran Desert in dunes and desert scrub with sandy soils below 330 feet elevation. Flat-seeded Spurge is known to occur in Imperial, Riverside, San Bernardino Counties and in Arizona and Mexico. It is known in California from only four herbarium collections near Cathedral City.

Suitable sandy soils and Sonoran Desert scrub exists throughout the site. Flat-seeded Spurge was not observed during focused surveys conducted within the appropriate blooming period.

Las Animas Colubrina

Las Animas colubrina (*Colubrina californica*) is a CNPS List 2.3 species, indicating it is not very endangered in California and more common elsewhere (CNPS 2011). This is a covered species under the NECO Plan. This species is an evergreen shrub and occurs in Mojavean and Sonoran Desert creosote bush scrub and at elevations from approximately 30 to 3,000 feet above mean sea level. Dry canyon lands in Mojavean Desert scrub is the preferred habitat of this species. This species has also been reported from Joshua tree woodland habitats, but primarily occurs in dry canyons with gravelly, sandy soils (TetraTech 2010).

The distribution of this species includes San Diego, Imperial, and Riverside counties; portions of Arizona; Baja California; and Sonora, Mexico. This species has been reported from isolated desert locales in Joshua Tree National Monument, the Eagle Mountains, and the Chuckwalla Mountains (TetraTech 2010). There are approximately 27 occurrences primarily from the Chocolate Mountains area (BLM 2002). The nearest CNDDB record is from McCoy Springs in the McCoy Mountains in 1976 from approximately 2,800 feet elevation (CNDDB 2010). This species typically blooms from April through June.

This species was not observed during May 2011 surveys; however, habitat for this species occurs within the Project area. Although deciduous, this small shrub would have been easy to locate and identify during surveys conducted in early May.

Glandular Ditaxis

Glandular ditaxis (*Ditaxis claryana*) is a CNPS List 2 perennial herb covered under the NECO Plan. Glandular ditaxis is in the *Euphorbiaceae* family and occurs in Mojavean and Sonoran Desert creosote bush scrub with sandy soils at elevations below 1,526 feet; the flowering period ranges from October to March depending on seasonal rainfall (CNPS 2011). The nearest known location occurs near Desert Center, approximately 25 miles west of the Project area (CalFlora 2011).

This species has moderate potential to occur based on habitat suitability. Appropriate vegetation and soil conditions exist throughout the Project site in relatively undisturbed areas. Glandular ditaxis was not observed during surveys conducted in May 2011, outside of the appropriate blooming period for this species.

Harwood's Woollystar

Harwood's woollystar (*Eriastrum harwoodii*) is an annual herb in the *Polemoniaceae* family that flowers from March to June. Harwood's woollystar is a CNPS List 1B.2 species occurring on desert dunes and loose sand in Sonoran Desert scrub below 3,000 feet in elevation.

Harwood's woollystar was observed in stabilized desert dunes and creosote bush scrub with loose sandy soils throughout the proposed transmission line corridor south of I-10. This species was found in the same loose, sandy habitat as ribbed cryptantha and was limited to the transmission line portion of the proposed Project (Figure 3).

Bitter Rubberweed

Bitter rubberweed (*Hymenoxys odorata*) is an annual herb in the *Asteraceae* family that blooms from March to June. It is a CNPS List 2 species. Bitter rubberweed occurs in seeps and riparian zones within Mojavean and Sonoran Desert scrub in mesic sandy or alkaline soils, from 145 to 500 feet elevation, and blooms from February to November (CNPS 2011). Hickman (1993) gives the blooming period from

February to May for this species, so the actual blooming period may vary based on location and seasonal rainfall. There are only 10 occurrences of Bitter rubberweed in California. One known occurrence south of I-10 lies just south of the Project area in the Ripley USGS quadrangle (CalFlora 2011). Bitter rubberweed is threatened by agriculture; most of the sandy flats along the Colorado river where this species historically occurred have been converted to agriculture.

Suitable habitat for this species is limited to the desert riparian woodland wash located in the easternmost portion of the proposed transmission line. Surveys were conducted in the Project area within the blooming period for bitter rubberweed. The species was not observed.

California Satintail

California satintail (*Imperata brevifolia*) is a CNPS List 2.1 species. This perennial, rhizomatous grass is found in wet alkaline meadows, stream sides and floodplains below 4,000 feet elevation. Known occurrences exist several miles north of Blythe Airport, between the McCoy Mountains and Midland Road.

Habitat for California satintail does not occur within the Project area.

Lobed Ground-cherry

Lobed ground-cherry (*Physalis lobata*) is a CNPS List 2.3 perennial herb in the *Solanaceae* family. It occurs in Mojavean Desert scrub on decomposed granitic soils and playas from 1,640 to 2,625 feet elevation and blooms from September to January. There are no records of lobed ground-cherry in Riverside County. The nearest records are located north in San Bernardino County near the Calumet Mountains and Old Woman Mountains, well outside of the Project vicinity.

Based on elevation criteria and known occurrences, there is no potential for lobed ground-cherry to occur at the Project site. Focused surveys should not be required for this species.

Orocopia Sage

Orocopia sage (*Salvia greatae*) is a CVMSHCP-listed, CNPS List 1B.3 evergreen shrub that blooms from March to April. This species occurs in Mojavean and Sonoran Desert scrub habitats on alluvial slopes at elevations ranging from 131 feet to 2,706 feet and is known to occur in the Orocopia and Chocolate Mountains in the southeast Sonoran Desert. The nearest known occurrence lies approximately 35 miles west of the Project area, near Desert Center. Orocopia sage is known from Imperial, Riverside and San Bernardino Counties.

Orocopia sage was not observed during recent surveys, which fell outside of the blooming period for this species. However, an evergreen shrub in the *Lamiaceae* family would have been observed and identified during surveys conducted in May 2011. There is low potential for this species to occur based on habitat requirements and occurrence records.

Desert Spike-moss

Desert spike-moss (*Selaginella eremophila*) is a CNPS List 2.2 rhizomatous mat-forming herb that occurs in shaded sites among rocks and in crevices in gravelly soils. It is found in the eastern peninsular ranges of the Sonoran Desert below 3,000 feet elevation.

Suitable habitat for desert spike-moss was not present at the Project site.

Cove's Cassia

Cove's cassia (*Senna covesii*) is a CNPS List 2.2 perennial herb in the *Fabaceae* family that blooms from March to June, but typically blooms in April (CNPS 2011). It occurs in dry, sandy desert washes and along sandy slopes in the Sonoran desert in the Chuckwalla Mountains at elevations ranging from 1,000 to 3,510 feet. The nearest known occurrence is one mile northwest of the Cottonwood Springs Road and I-10 interchange, approximately 45 miles west of the proposed Project.

Habitat for Cove's cassia is not present based on elevation criteria. Furthermore, it was not observed during focused surveys conducted within the appropriate blooming period for this species.

Jackass Clover

Jackass clover (*Wislizenia refracta* ssp. *refracta*) is a CNPS List 2.2 species covered by the NECO Plan. Jackass clover is an annual herb in the *Capparaceae* family that blooms between April and October and occurs in sandy washes, roadsides, alkaline flats, desert dunes and scrub in the Mojave and Sonoran Deserts from 1,600 to 2,000 feet elevation. There are five records for this species in Riverside County; however, there are no records in the vicinity of the Project area. The nearest occurrence lies northwest of the site in the Palen Mountains, approximately 30 miles from the site (CalFlora 2011).

Based on elevation criteria and known records, jackass clover is not likely to occur within the Project area.

Orcutt's Woody Aster

Orcutt's woody aster (*Xylorhiza orcuttii*), a perennial herb in the *Asteraceae* family, blooms from March to April in arid canyons with creosote bush scrub from 60 to 1,000 feet elevation. It is a CNPS List 1B.2 species and a BLM sensitive species. According to California Energy Commission (CEC) data, one plant was recorded in Riverside County north of the San Diego/Imperial County border in Indio.

Surveys were conducted outside of the blooming window for Orcutt's woody aster; however, only marginal habitat for this species occurs in the Bajada area in the northeast portion of the Project site, north of I-10.

THIS PAGE INTENTIONALLY LEFT BLANK

TABLE 3. SPECIAL-STATUS PLANT SPECIES RELEVANT TO THE PROPOSED PROJECT POTENTIALLY OCCURRING IN THE STUDY AREA

Common Name Scientific Name	Sensitivity Status[1]	General Habitat Description (CNPS 2007)	Plant Habit, Flowering Period	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]
Angel trumpets *(Acleisanthes longiflora)*	CNPS: List 2.3 NECO Plan	Dry places, generally on carbonate or limestone derived soils in mountainous areas 30 to 8,000 feet	Prostrate to ascending perennial stems less than three feet. Flowers produced during May.	The closest record of this species is in the Big Maria Mountains.	Low	Low
Coachella Valley Milkvetch *(Astragalus lentiginosus var. coachellae)*	ESA: Endangered CNPS: List 1B.2 BLM: Sensitive	Sonoran Desert, in sandy areas growing at elevations of 0 to 1,150 feet.	Annual or perennial herb that flowers February to May	Habitat for this species occurs within the sandy washes. Most populations are restricted to the Coachella Valley, approximately 50 miles west of the airport.	Low	Low
Harwood's milkvetch *(Astragalus insularis var. harwoodii)*	CNPS: List 2.2 NECO Plan	Sonoran Desert, sandy to gravely areas 0 to 1,000 feet.	Annual that blooms January – May	This species was detected in the Project vicinity toward the northwestern limits in 2009 (CEC).	Moderate	High
Fairyduster *(Calliandra eriophylla)*	CNPS: List 2.3 NECO Plan	Sonoran Desert, sandy washes, slopes and mesas typically between 390 and 5,000 feet.	Shrubs less that 1 foot in height; blooms March to April	Minimal potential habitat present. Site elevation is approximately 500 feet.	Low	Low
Crucifixion horn *(Castela emoryi)*	CNPS: List 2.3 NECO Plan	Desert areas on dry, gravelly washes, slopes, plains ±2,150 feet.	Shrub less than 10 feet in height; blooms April to May	Site elevation is approximately 500 feet. This large shrub was not observed in the surveys, which were conducted within the appropriate blooming period.	None	None
Abrams' spurge *(Chamaesyce abramsiana)*	CNPS List 2.2	Mojavean Desert scrub and Sonoran Desert scrub on sandy soils up to 3,000 feet.	Annual herb that blooms from September to November		Moderate	High

Common Name Scientific Name	Sensitivity Status[1]	General Habitat Description (CNPS 2007)	Plant Habit, Flowering Period	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]
Flat-seeded spurge *(Chamaesyce platysperma)*	CNPS List 1B.2	Desert dunes and Sonoran desert scrub on sandy soils from 210 to 330 feet.	Annual herb that blooms from February to September but typically in May		Moderate	High
Las Animas colubrine *(Colubrina californica)*	CNPS: List 2.3 NECO Plan	Sonoran creosote bush scrub less than 3,500 feet.	Plants are generally less than 3 feet; blooms April to June	According to CEC 2009 data, specimens were observed in flower during April; an early blooming period for this species. Similar habitat is expected to occur in the Project area.	Low	High
Glandular ditaxis (*Ditaxis claryana)*	CNPS List 2.2 NECO Plan	Sonoran Desert at elevations less than 350 feet; sandy soils in creosote bush scrub	Annual or perennial herb that blooms from December to May.	Sandy soils at low elevations are present. Site elevation is approximately 500 feet.	Low	Moderate
Harwood's woollystar *(Eriastrum harwoodii)*	CNPS List 1B.2	Desert dunes and Sonoran Desert scrub on sandy soils from 655 to 3,000 feet.	Annual herb that blooms from March to June	Observed throughout the transmission line portion of the Project area.	Low	Present
Bitter hymenoxys *(Hymenoxys odorata)*	CNPS List 2	Chaparral, coastal scrub, Mojavean Desert scrub, and meadows and seeps, often in alkali soils, and riparian scrub with mesic soils. Most often found on sandy sites from 145 to 490 feet.	Annual herb that blooms from February to November (CNPS, 2011); February to May (Hickman, 1993)	Habitat for this species is limited to the desert riparian woodland wash located in the easternmost portion of the proposed transmission line.	Low	Low
California satintail *(Imperata brevifolia)*	CNPS List 2.1	San Bernardino Mountains, Mojave Desert, in cultivation. Found up to 1,700 feet	Perennial grass found near wet springs, meadows, streamsides and flood plains. Flowering September to May.	The habitat for this species (wet springs, meadows, stream sides and flood plains) does not occur	Low	Low

Common Name Scientific Name	Sensitivity Status[1]	General Habitat Description (CNPS 2007)	Plant Habit, Flowering Period	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]
Lobed ground-cherry *(Physalis lobata)*	CNPS List 2.3	Mojavean Desert scrub on decomposed granitic soils, and on playas. From 1,640 to 2,625 feet.	Perennial herb that blooms from September to January	Suitable habitat is not present based on elevation criteria.	None	None
Orocopia sage *(Salvia greatae)*	CNPS List 1B.3 NECO Plan	Southeast Sonoran Desert (Orocopia, Chocolate Mtns.) on alluvial slopes between 100 to 800 feet.	Evergreen shrubs less than 3 feet in height with white blooms from March to April.	Nearest known occurrence near Desert Center; 35 miles west of the Project.	Low	Low
Desert spikemoss *(Selaginella eremophila)*	CNPS List 2.2	Eastern Peninsular Ranges to the Sonoran Desert at elevations less than 3,000 feet. Shaded sites among rocks, in crevices and gravelly soils.	Rhizomatous mat-forming non-flowering herb.	The habitat for this species (shaded gravel soil in crevices and rocks) is limited in the Project area.	Low	Low
Coves' cassia *(Senna covesii)*	CNPS List 2.2 NECO Plan	Dry, sandy desert washes, slopes of the Sonoran Desert between 1,600 to 2,000 feet.	Small perennial herb up to 2 feet tall blooming in April.	This species occurs in desert washes and slopes. Occurs in the Chuckwalla mountains. Habitat is not present based on elevation criteria.	None	None
Dwarf germander *(Teucrium cubense ssp. depressum)*	CNPS List 2.2	Sandy soils, washes and fields in the Sonoran Desert below 1,200 feet.	Annual plants up to 6 inches tall; blooms March to May.	Habitat for this species is present within the Project area and vicinity.	Low	High
Jackass clover *(Wislizenia refracta ssp. refracta)*	CNPS List 2.2 NECO Plan	Sandy washes, roadsides, alkaline flats in the Mojave Desert, and northern Sonoran Desert between 1,600 to 2,000 feet	Annual; flowers between April and November.	Habitat is not present based on elevation criteria.	None	None
Orcutt's woodyaster *(Xylorhiza orcuttii)*	CNPS List 1B.2 BLM Sensitive	Arid canyons between 60 to 1000 feet.	Shrubs less than 5 feet in height; blooms March to April.	According to California Energy Commission data, one plant recorded north of the San Diego / Imperial County border in Indio (Riverside County).	Low	Low

Common Name Scientific Name	Sensitivity Status[1]	General Habitat Description (CNPS 2007)	Plant Habit, Flowering Period	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]

[1]Sensitivity Status Key

ESA Endangered
CNPS California Native Plant Society Lists:
1B: Considered rare, threatened, or endangered in California and elsewhere.
2: Plants rare, threatened, or endangered in California, but more common elsewhere
Decimal notations: .1 - Seriously endangered in California, .2 – Fairly endangered in California, .3 – Not very endangered in California
BLM Special-Status Plants
NECO Plan: Northern and Eastern Colorado Desert Coordinated Management Plan special-status species

[2]Species Potential for Occurrence
Low Potential –low potential to occur because suitable habitat expected, but of marginal quality
Moderate Potential –has moderate potential to occur because suitable habitat expected to be present but was not found during focused plant surveys
High Potential –has high potential to occur because suitable habitat expected to be present, and species known to occur within the vicinity but was not found during focused plant surveys
Present – if detected during surveys

4.1.4 Fauna

This section discusses special-status wildlife species detected within the study area or with potential to occur on site. In total, 57 wildlife species were detected during general reconnaissance and protocol wildlife surveys (Appendix B). Of these, seven special-status wildlife species or their sign were observed within the study area (Table 6), including Mojave fringe-toed lizard, western burrowing owl, Le Conte's thrasher, loggerhead shrike, American badger, desert kit fox, and Nelson's bighorn sheep. In total, 11 insect, 9 reptile, 28 bird, and 9 mammal species were detected during biological surveys.

Wildlife species observed during the individual reconnaissance and focused surveys are listed in Appendix B. The species most commonly observed during biological surveys included lizards, such as the common side-blotched lizard (*Uta stansburiana*), desert iguana (*Dipsosaurus dorsalis)* and western whiptail (*Aspidoscelis tigris*), along with desert ironclad beetle (*Asbolus verrucosus*), common raven (*Corvus corax*), great-tailed grackle (*Quiscalus mexicanus*), and white-tailed antelope squirrel (*Ammospermophilus leucurus*).

Species accounts are provided below for the special-status species that could occur within the Project area. This includes species that both were and were not detected during surveys. Razorback sucker, while listed with a record in CNDDB (CDFG 2011), is expected to be absent due to a lack of habitat within the Project area and is not discussed below. Table 4 provides a summary of the species accounts and potential to occur.

Federal Listed Wildlife Species

No federal listed wildlife species or their sign were detected during surveys.

Desert Tortoise

Desert tortoise (DT) is a federal- and State-listed as Threatened species. Its range includes the Mojave and Sonoran Deserts. It is most common in desert scrub, creosote bush scrub, desert wash, and Joshua tree habitats. It occurs from near sea level to up to 5,241 feet in elevation (Stebbins 2003). Tortoises typically inhabit soft sandy loams and loamy sands, although they are also found on rocky slopes and in rimrock that provide natural-cover sites in crevices. These may include desert oases, riverbanks, washes, dunes, rocky slopes, creosote bush flats, juniper woodland, or other desert habitats (Stebbins 2003). It requires friable soil for burrowing and nest construction. Tortoises will construct burrows in firm sand, typically at the base of bushes, or else use rocks for shelter or caves in well-developed calcic layers. In some instances, burrows and caves will be used communally or constructed in a group. A typical year consists of hibernation during the winter; feeding, courting, and mating in the spring; feeding and courting in the summer; and mating and hibernation in the fall (Berry 2008, USFWS 2008). Juveniles are typically active during more of the year than adults, as their smaller mass allows them to respond faster to temperature changes. DTs emerge from hibernation and begin the reproductive process in March and April. Nests are often constructed at the opening or just inside of burrows. If conditions are unfavorable for egg-laying, females may carry sperm in the albumen gland in their oviducts for two to three years, and sometimes for as long as 15 years. Eggs are usually laid between May and July in clutches of 1 to 12 eggs. DTs reach sexual maturity between 12 to 25 years of age, or at around 180 mm (Berry 2008). DTs will typically forage on winter and summer annuals, herbaceous perennials, succulents, and grasses, usually found in intershrub spaces, washes, and washlets. Preferred vegetation includes lupines, lotuses, vetches, evening primroses, and other native plants.

No individuals or sign were detected during surveys. Suitable habitat to support this species is present within the Project area, primarily in the proposed transmission line corridor. This species is expected to have a low to moderate potential to occur within the Project area, with higher potential to occur within the proposed transmission line corridor, which presents more suitable habitat than the proposed solar array area. The agricultural fields or recovering fields that make up much of the proposed solar array do not

present suitable habitat for this species. Although DT is present in the general Project vicinity and designated critical habitat (Chuckwalla Unit; 59 FR 5820 5866) is located approximately 15 miles west of the Project area, based on surveys conducted for the Blythe Solar Power Project in areas that overlap the BMSP, occurrences and detections of sign seem to primarily be located in the foothills (AECOM 2010), not in the areas immediately surrounding the Project area. Thus, while it's possible that DT may occur in or near the Project area, it is much more likely to be found, based on recent surveys, in areas northwest of the BMSP.

State-listed Wildlife Species

No State-listed wildlife species or their sign were detected during surveys.

Swainson's Hawk

Swainson's hawk is a State-listed Threatened and Forest Service Sensitive species, as well as a USFWS Bird of Conservation Concern. Its breeding habitat includes grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural fields and ranches. It also requires adjacent suitable foraging areas, such as grasslands or alfalfa or grain fields that support rodent populations. It is not known to breed or winter in the southeastern California area, but may pass through the area as a migrant (Stokes and Stokes 2010).

Swainson's hawk is expected to have a low potential to occur within the Project area. It is not expected to be nesting or breeding in the area and may pass through on its migration route.

Gilded Flicker

The gilded flicker is a State-listed Endangered species and USFWS Bird of Conservation Concern. It is a year-round resident of the Colorado Desert area (CDFG 2008, Stokes and Stokes 2010), typically inhabiting cottonwood and riparian areas near the Colorado River, as well as washes and Joshua tree habitats (CDFG 2008). It requires snags and hollow trees for nesting and uses trees, shrubs, nests, and roost cavities for cover (CDFG 2008). Its breeding period is during April and May (CDFG 2008). Its diet is composed primarily of insects, but it also consumes a large amount of plant matter.

Gilded flicker was not detected within the Project area during surveys and is expected to have a low potential for occurrence based on the availability of habitat within the Project area.

Gila Woodpecker

The Gila woodpecker is a State-listed Endangered species and USFWS Bird of Conservation Concern. It is found in cottonwood trees and other desert riparian areas and nests in cavities in riparian trees or in saguaro (*Carnegiea gigantea*), breeding from April to July and peaking in April and May (CDFG 2008). It may occasionally raise two broods in a single season (CDFG 2008). This species feeds on insects pecked or probed out of bark, crevices in trees, or inside cacti. It also eats certain cactus fruits.

Gila woodpecker was not detected within the Project area. It is expected to have a low potential to occur based on a general lack of suitable habitat within the Project area.

Non-listed Special-Status Wildlife Species

Seven non-listed special-status wildlife species or their sign were detected on site, including the Mojave fringe-toed lizard, western burrowing owl, Le Conte's thrasher, loggerhead shrike, desert kit fox, Nelson's bighorn sheep, and American badger. These detections are discussed in detail below.

Special Status Wildlife Species Accounts

Mojave Fringe-toed Lizard
Mojave fringe-toed lizard (MFTL) is a Species of Special Concern and a BLM Sensitive species that occurs on wind-blown sandy areas with creosote bush scrub cover in the Mojave and northern Colorado Deserts. It can usually be found in dunes, in margins of dry lakebeds and washes, or in isolated dune pockets against hillsides at elevations below sea level to up to 900 meters (Espinoza 2009). They are most active from March to October and typically brumate from November to February, usually depositing one to five eggs in the sand from May to July (Stebbins 2003, Espinoza 2009). While they will often produce multiple clutches of eggs in wet years, in dry years they may skip breeding entirely (Espinoza 2009). Their home ranges are typically 0.25 acre for males, and one-third that size for females (Espinoza 2009).

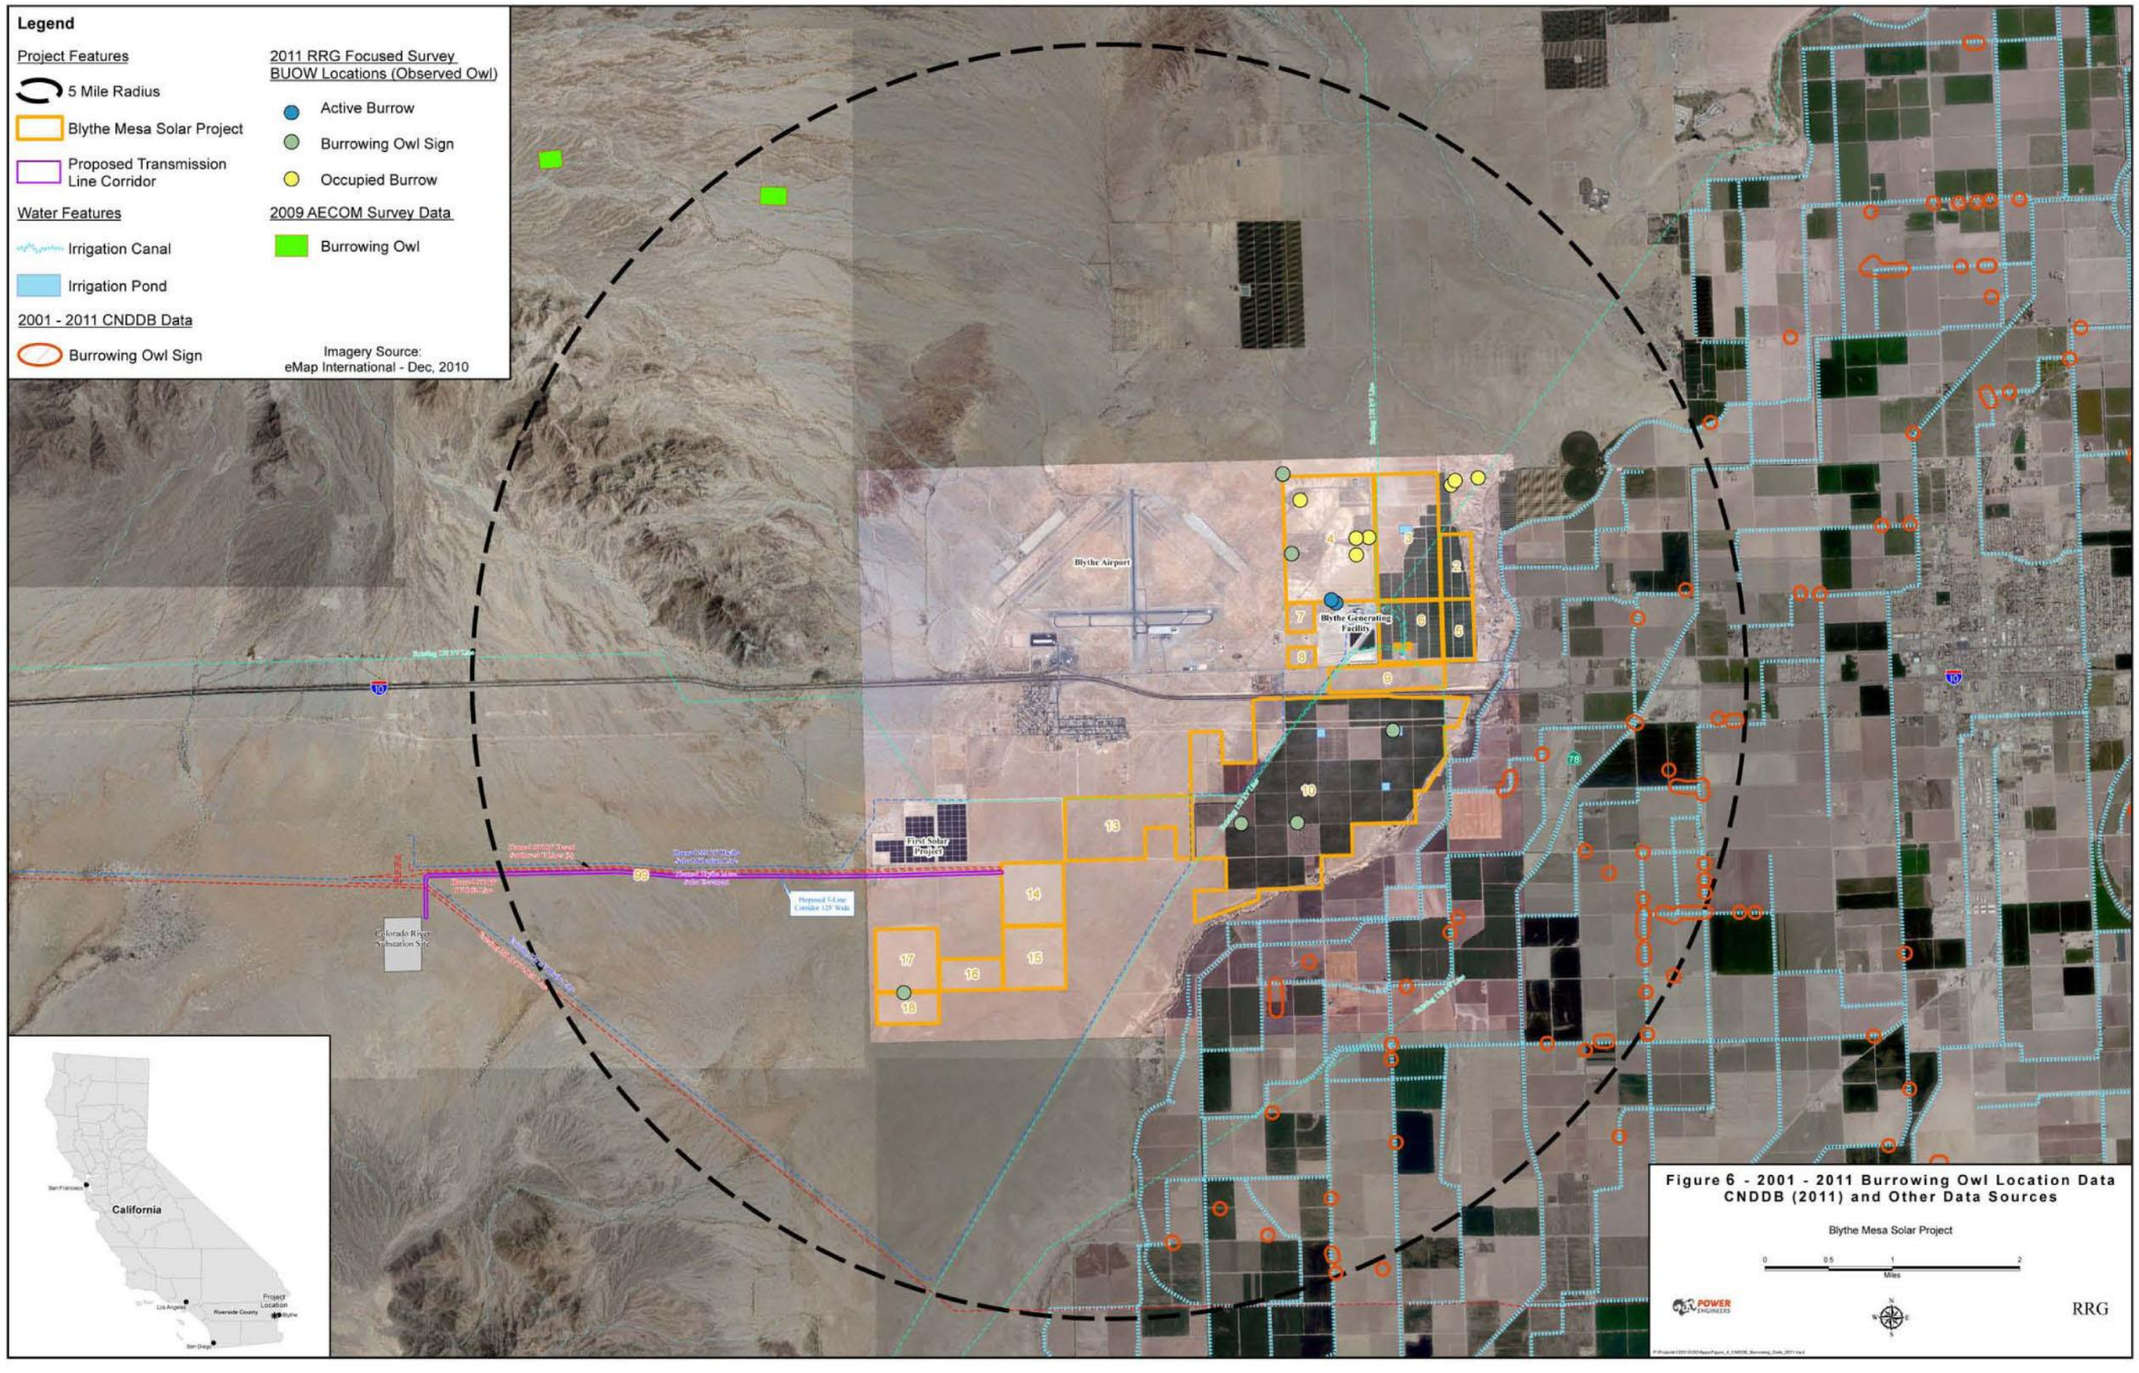
Mojave fringe-toed lizards were detected throughout the Project area, mainly in the transmission line portion both under the centerline and in the adjacent survey buffer zones. A total of 64 detections were made during the transmission line surveys. MFTL was the most common reptile species observed during surveys. No MFTL were observed within the solar array footprint.

Couch's Spadefoot Toad
Couch's spadefoot toad is a Species of Special Concern and a BLM Sensitive species. In California, it is found in the extreme southeast, including southeastern San Bernardino County and eastern Riverside and Imperial Counties (Jennings and Hayes 1994). They are found in desert washes, creosote bush scrub, alkali sink scrub, palm oases, and other vegetated areas that can support their habitat needs (CDFG 2008). They require areas that have substrate capable of sustaining temporary pools for breeding but that are still loose enough for burrowing (Jennings and Hayes 1994, BLM and CDFG 2002). Their breeding habitat includes temporary impoundments at the base of dunes as well as road or railroad embankments, temporary pools in washes or channels, pools that form at the downstream end of culverts, and playas (BLM and CEC 2010). Possibly due to the difficulty of locating naturally occurring ponds within the short retaining periods, most of the known Couch's spadefoot toad breeding ponds are artificial. This species is dormant from 8 to 10 months of the year, emerging from burrows after summer rains typically anywhere between May and September (Stebbins 2003, CDFG 2008). Couch's spadefoot toads typically eat termites, but will also eat beetles, ants, spiders, moths, or other insects (CDFG 2008).

Couch's spadefoot toad was not observed in the Project area during surveys. It is expected to have a low potential to occur in the Project area, although it is difficult to be certain where they may be present due to their long dormancies each year.

Golden Eagle
The golden eagle is a CDFG Fully Protected Species and Watch List Species and a USFWS Bird of Conservation Concern. It breeds throughout the United States and in Canada, Europe, and Asia, and is a year-round resident of much of the western United States (Kochert et al. 2002). It is more rare in California's Central Valley and southeastern deserts from the Salton Sea and east. In California, the golden eagle typically nests in open grasslands and oak savannas and less frequently in oak woodlands and open shrublands (Kochert et al. 2002). Preferred nesting sites are on cliffs or in large trees surrounded by open habitat (CDFG 2008). Foraging also typically occurs in open grassland habitats, and winter habitat in Southern California is primarily in mountainous areas (Kochert et al. 2002). Territories in Southern California are around 36 square miles on average, and home ranges are believed to be the same (CDFG 2008). Breeding occurs from late January through August, peaking from March to July (CDFG 2008).

Golden eagles or their nests were not observed during surveys for this Project. While the Project area is generally inadequate to support nesting, there is adequate foraging habitat for this species in the area and



it is expected to have a moderate potential to occur as a forager. There are no known golden eagle nests in the general vicinity of the Project area (AECOM 2010).

Western Burrowing Owl

Western burrowing owl (WBO) is designated as a Priority 2 Bird Species of Special Concern by CDFG due to rapid habitat loss and degradation from urbanization. It is also designated as a BLM Sensitive species and a USFWS Bird of Conservation Concern. Its range extends through all states west of the Mississippi Valley and into Mexico, Central America, and South America. In California, it typically inhabits lowlands, including those in the Central Valley, northeastern plateau, southeastern deserts, and coastal areas. For shelters, the burrowing owl uses rodent burrows in sparse grassland, desert, and agricultural habitats, as well as open areas of pinyon-juniper or ponderosa pine habitats (CDFG 2008). Breeding populations generally display greater site fidelity than winter populations, which tend to move about more, even taking refuge into vegetation instead of nearby burrows (Poulin et al. 2011). Individuals in California, particularly Southern California, are mostly residents (CDFG 2008). Nesting begins from late March to August, peaking in April and May (CDFG 2008). While some pairs have been observed to have double broods within a single breeding season, it is considered to be uncommon and is not always successful (Poulin et al. 2011). Burrowing owls are typically active at dusk and dawn, but can sometimes be active at night, as well.

Two WBO burrows were detected in the northeastern section of the Project, with a single individual observed outside one of the burrows, during the Project reconnaissance surveys. The individual and its burrow were observed in a disturbed creosote field previously used for military purposes. During the protocol burrowing owl surveys, six owls were observed within the Project area, and an additional two owls were observed outside the Project area in an area that could be indirectly affected.

FIGURE 6. BURROWING OWL LOCATION DATA

THIS PAGE INTENTIONALLY LEFT BLANK

Ferruginous Hawk

Ferruginous hawk is a CDFG Watch List species. It does not breed in California, but is a winter resident of most of the state, including the Project area (Stokes and Stokes 2010). In California, it is most common in open areas, such grasslands, agricultural areas, and deserts, and is typically associated with small mammal populations.

Ferruginous hawks were not observed during Project surveys, which did not occur within the winter. It has a low potential to occur within the Project area, which it may use for wintering habitat, but not for breeding.

Yellow Warbler

The Sonoran subspecies of yellow warbler is a Species of Special Concern and USFWS Bird of Conservation Concern. It is a winter resident of the Colorado River valley (CDFG 2008). It inhabits riparian woodlands, montane chaparral, ponderosa pine and mixed conifer habitats, and desert lowlands. It typically eats insects and spiders from the upper canopy of deciduous trees and shrubs, but will occasionally take insects from the air or eat berries (CDFG 2008).

Yellow warbler was not detected during surveys within the Project area. It is expected to have a low potential for occurrence based on a lack of suitable habitat. No breeding is expected within the Project area, but migrants may be passing through or overwintering in the area.

Loggerhead Shrike

The loggerhead shrike is listed as a CDFG Species of Special Concern and USFWS Bird of Conservation Concern. Their range in California extends throughout most of the state, except for the northwest. Habitats typically occupied by loggerhead shrike include those possessing open space with patchily distributed trees, shrubs, or other areas to perch (Yosef 1996, CDFG 2008). Deserts possessing spiny shrubs and scrubby vegetation as well as pastoral, agricultural, valley-foothill hardwood or hardwood-conifer, pinyon-juniper, juniper, Joshua tree woodland, or suburban settings are frequently occupied (Yosef 1996, CDFG 2008). They are often found near water (CDFG 2008). Nests will usually be constructed in isolated trees or large shrubs within the occupied habitat. Pairs in California remain together year-round and defend their territories from other individuals of their kind. They typically nest earlier than most other passerines, perhaps as a result of their year-round association with mates (Yosef 1996). This bird species preys mainly on arthropods, but will also feed on reptiles, amphibians, fish, small mammals, and other small birds (CDFG 2008).

Loggerhead shrikes were detected on both the proposed solar array and transmission line areas.

Vermilion Flycatcher

The vermillion flycatcher is a Species of Special Concern. It is found in desert, cropland, savanna, chaparral, and other desert riparian and woodland habitats adjacent to irrigated fields, ditches, pastures, or other open mesic areas (CDFG 2008). Its peak nesting time is in April and May, when it nests in willows, cottonwoods, mesquite, or other large trees or shrubs. It often raises two broods. Its diet mainly comprises insects caught by flycatching, particularly bees, and from the ground surface (CDFG 2008).

Vermilion flycatcher was not observed during surveys in the Project area. It is expected to have a low to moderate potential to occur within the Project area, as some suitable habitat can be found in the solar array area, but available ground water and mesic areas are somewhat restricted.

Crissal Thrasher

Crissal thrasher is a Species of Special Concern. It is a non-migratory resident of southern Nevada and southeastern California to western Texas and central Mexico. It typically prefers riparian brush at lower elevations within its northwestern range in the Colorado River valley (Martin 1999). In the summer around the Colorado River, it has a greater utilization of mesquite and other native habitat, but also frequents habitat dominated by non-native species such as tamarisk (*Tamarix* sp.) (Martin 1999). Breeding typically occurs from mid-January to late July or early August (Martin 1999).

Crissal thrasher has a low to moderate potential to occur in the Project area. While no individuals were observed during surveys, some habitat is present in the area that could support foraging, although the available habitat is less likely to support nesting.

Le Conte's Thrasher

Le Conte's thrasher is a Species of Special Concern and a USFWS Bird of Conservation Concern. In California, Le Conte's thrasher is a resident species in the San Joaquin Valley and the Mojave and Colorado Deserts in southeastern California. It occurs in desert washes, desert scrub, alkali desert scrub, and desert succulent shrub habitat (CDFG 2008). Because creosote bush is unable to sufficiently support nests, Le Conte's thrashers typically do not occur in monotypic creosote bush scrub habitat or in massive Sonoran Desert woodlands (Prescott 2005). Preferred nest substrate includes thorny shrubs or cholla cactus (Shepard 1996). Breeding activity occurs from January to early June, peaking from mid-March to mid-April (CDFG 2008). Pairs typically attempt up to three broods each year. Le Conte's thrashers forage for food by digging and probing in the soil with their bills, searching for arthropods (the majority of their diet), small lizards and snakes, other vertebrates, and seeds and fruit (Sheppard 1996, CDFG 2008).

Two Le Conte's thrashers were detected during the transmission line ROW surveys.

Pallid Bat

The pallid bat is a Species of Special Concern, Forest Service Sensitive species, and BLM Sensitive species. Pallid bats inhabit low elevation (less than 6,000 feet) rocky arid deserts and canyonlands, and shrub-steppe grasslands, but also occur in higher elevation coniferous forests (greater than 7,000 feet). They are most abundant in xeric ecosystems, including the Great Basin, Mojave, and Sonoran Deserts (Hermanson and O'Shea 1983). Pallid bats roost alone, in small groups, or in large groups composed of hundreds of individuals (Rambaldini 2005). Day and feeding roosts include escarpments and cliffs, caves, mines, trees (especially oak cavities, exfoliating bark, and deciduous trees in riparian areas) and man-made structures such as bridges, barns, porches, bat boxes, and buildings. Roosts are generally warmer than ambient temperature, have unobstructed entrances/exits, and are at such a height that access by terrestrial predators is dissuaded (Rambaldini 2005). Although roost fidelity is common, they may switch day roosts on a daily or seasonal basis. Females typically have one or two pups each year, although incidences of three pups have been reported. Mating generally occurs between October and February, followed by parturition from late April to July, and finally weaning in August. Timing of these events varies across latitudes and between years, and is probably influenced by prey availability and temperature. Populations at higher latitudes and in cooler climates give birth later in the season. Maternity colonies dissolve between weaning in August and the next mating season in October (Rambaldini 2005). Pallid bats forage over many habitat types, including shrub-steppe or oak savannah grasslands, Ponderosa pine forests, talus slopes, gravel roads, lava, orchards, and vineyards (Rambaldini 2005). Known prey include a large variety of beetles, centipedes, lepidopterans, moths, praying mantids, scorpions, and termites, as well as vertebrates such as geckos, lizards, skink, and small rodents (Whitaker et al. 1981).

Pallid bats are expected to have a moderate potential to occur within the Project area. Although suitable roosting habitat is present, particularly in the area around the desert riparian woodland wash, the closest documented occurrence of this species is from 1992 and is approximately 30 miles away (CDFG 2011).

Hoary Bat

The hoary bat is tracked by the CNDDB and does not have any particular agency protection status (CDFG 2011). It is present throughout most of California, but is patchily distributed in southeastern California (CDFG 2008). In migration events, males are typically found in foothills, deserts, and mountains, while females are found in lowlands and coastal valleys. Water is required. Its roost sites are usually in large trees with dense foliage that are obscured from above and relatively open below. Although breeding occurs in the fall, fertilization is delayed and young are born from mid-May through July (CDFG 2008). Food is primarily composed of moths and other flying insects.

The hoary bat was not detected within the Project area during surveys. It is expected to have a low potential to occur in the Project area, as water is generally limited in availability. The closest documented occurrence is from 1919, less than two miles from the Project area (CDFG 2011).

California Leaf-nosed Bat

The California leaf-nosed bat is a Species of Special Concern, BLM Sensitive, and Forest Service Sensitive species. It is found in desert riparian, desert wash, desert scrub, desert succulent scrub, alkali desert scrub, and palm oasis habitats (CDFG 2008). It roosts in caves, old buildings, and abandoned mines. While mating occurs in September and November, implantation is delayed until the following May and June (CDFG 2008). Diet for this species consists of large insects, insect larvae, and fruit.

California leaf-nosed bat was not detected within the Project area. It is expected to have a moderate potential to occur within the Project area due to the availability of suitable habitat within the Project area and a 2002 CNDDB record (CDFG 2011) that is located in an adjacent quadrangle (specific location information is suppressed).

Arizona Myotis

The Arizona myotis is a Species of Special Concern. Its California range is restricted to the Colorado River valley and the surrounding desert areas, where it inhabits the lowlands and mountain ranges around the Colorado River and forages in desert riparian areas. Its daily roosts may be in buildings, trees, caves, or under rocks or wood, though its hibernation roosts are typically in caves or mines (CDFG 2008). Although mating occurs in the fall, fertilization is delayed until the following spring, with birth occurring between May and August, typically only one young each year (CDFG 2008). This species tends to feed on small, flying insects, but may take larger prey in some circumstances.

Arizona myotis was not detected within the Project area during surveys. It is expected to have a moderate potential to occur based on the availability of roosting and foraging habitat in the Project area. The closest documented record from the CNDDB (CDFG 2011) is from 1942, approximately five miles south of the Project area.

Cave Myotis

The cave myotis is a Species of Special Concern and BLM Sensitive species. It is restricted in California to the Colorado River and its adjacent mountain ranges, inhabiting desert scrub, desert succulent scrub, desert wash, and desert riparian habitats (CDFG 2008). It utilizes caves primarily, but will also use mines and buildings. Mating typically occurs in the fall and winter, with one young born in June and July (CDFG 2008). The diet of the cave myotis consists of mostly flying insects, which are generally caught near water.

Cave myotis was not detected within the Project area during surveys. It is expected to have a moderate potential to occur based on the availability of foraging habitat. However, roosting habitat within the

Project area is limited. The closest documented potential occurrence is a colony in an adjacent quadrangle from 2002, although the specific species present is unknown and the location is suppressed (CDFG 2011).

Nelson's Bighorn Sheep

The Nelson's bighorn sheep is a BLM sensitive species. It occurs from the Transverse Ranges into the desert mountain ranges of California, Nevada, and northern Arizona to Utah. Bighorn sheep require steep, rocky slopes for escape routes from predators. They may be found in mountains, high meadows, deserts, or other areas that provide quick access to these steep escape routes (Reid 2006). Surface water is also essential. In the spring and summer, bighorn tend to disperse downhill to bajadas and alluvial fans and forage on grasses and sedges; alternately, in the winter when annual plants are not blooming, bighorn sheep will tend to forage on woody plants instead (Reid 2006). While rutting begins in November and December, young are not typically born until the following May or June (Reid 2006). Two metapopulations of bighorn sheep, the Southern Mojave and Sonoran metapopulations, occur within the NECO Planning Area. Within these metapopulations are demes, or smaller subpopulations of bighorn sheep, nine of which occur in the Sonoran metapopulation (BLM and CDFG 2002). These metapopulations have been fragmented by transportation corridors (roads and highways), aqueducts, and other types of linear development, such as fences or transmission lines. While these present potentially major barriers to bighorn sheep movements, bighorn sheep are also known to be able to cross many linear features.

A bighorn sheep skull was found within the proposed solar array disturbance area. It is unknown how long this skull had been there and if the animal died near this location or if the skull was washed downstream from somewhere else. Focused surveys for this species were not conducted and this sign was noted incidentally during the reconnaissance surveys.

American Badger

The American badger is listed as a CDFG Species of Special Concern. This species is distributed throughout California in open habitats containing friable soil for burrowing, except for the northern coast regions. It occurs in highest densities in relatively dry, open stages of shrub, forest, and herbaceous habitats, including plains, prairies, deserts, open valleys, woodland edges, and alpine meadows (Reid 2006, CDFG 2008). American badger ranges average from 400 acres for females to 600 acres for males in Idaho, whereas in Utah they have been measured ranging from 338 to 751 acres for females and 1,327 to 1,549 acres for males (CDFG ND). Although they mate in the summer and fall, actual implantation is delayed until the following March or April (Reid 2006). This species functions to control rodent populations in their respective ecosystems (CDFG 2008). American badgers are vertically compressed mustelids that prey chiefly on fossorial rodents, though reptiles, insects, birds and their eggs, carrion, and other items are also taken (Reid 2006).

Potential American badger burrows were observed in both the proposed transmission line and solar array portions of the Project area. One burrow was located in the northeast corner of the Project in the bajada habitat, another near the center of the four-mile proposed transmission line, and the third in the southwest corner of the Project just north of the alternative Colorado River Substation site. American badger prey species were observed during surveys (white-tailed antelope ground squirrels, kangaroo rats, etc.). Most of the study area is suitable for this species.

Desert Kit Fox

This particular subspecies of kit fox is a Protected Furbearing Mammal. Desert kit fox range in the U.S. extends from Southern California to western Colorado and west into Texas. Its northern range includes southern Oregon and Idaho. The kit fox is associated with multiple habitats, including desert scrub, saltbush, chaparral and grassland. They are mainly nocturnal, and use multiple burrows in their home range. Natal dens possess multiple entrances (Egoscue 1962). While the species is territorial, the primary

resource of concern is the natal den, which requires a significant level of energy to excavate compared to a single burrow. Litters are born in February or March (Reid 2006). Kit foxes are small canids that feed primarily on black-tailed jackrabbits, desert cottontails, kangaroo rats, ground squirrels, insects, reptiles, birds and bird eggs.

Potential desert kit fox scat and tracks were found scattered throughout the proposed solar array disturbance area.

4.1.5 Critical Habitat

The study area does not include any designated critical habitat for special-status plant or wildlife species. The Chuckwalla Unit, an area of designated critical habitat for the desert tortoise (59 FR 5820 5866), is approximately 15 miles west of the Project area.

THIS PAGE INTENTIONALLY LEFT BLANK

TABLE 4. SPECIAL-STATUS WILDLIFE SPECIES RELEVANT TO THE PROPOSED PROJECT POTENTIALLY OCCURRING IN THE STUDY AREA

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]
Reptiles					
Desert tortoise (*Gopherus agassizii*)	ESA: Threatened CESA: Threatened	Various desert scrubs and desert washes up to about 5,000 feet, but not including playas.	Desert tortoise is present to north and west of project areas but in foothill habitat. POWER walked 8 transects along 4 miles of the proposed transmission line corridor in suitable habitat but did not observe desert tortoise or its sign.	Low	Low
Mojave fringe-toed lizard (*Uma scoparia*)	CDFG: Species of Special Concern, BLM: Sensitive	Fine, wind-blown sand in creosote bush scrub of the Mojave and northern Colorado Deserts. From below sea level to 2,952 feet.	Species detected throughout the transmission line ROW during rare plant surveys. Suitable habitat is present within the solar array, though no individuals were detected.	High	Present
Amphibians					
Couch's spadefoot toad (*Scaphiopus couchii*)	CDFG: Species of Special Concern, BLM: Sensitive	Various arid and semiarid environments. Breeds in desert ponds quickly following rainfall.	Suitable habitat is not known to be present, but some areas may still support ponded water.	Low	Low
Birds					
Golden eagle (*Aquila chrysaetos*)	Eagle Protection Act, CDFG: Species of Special Concern, BLM Sensitive	Nest in rock cliff aerie.	Known to region. According to BLM and California Energy Commission reports (,AECOM 2010) no known nest within 10 miles of proposed Project (2009 data) but expected to use area for foraging.	Moderate (forage habitat)	Moderate
Western burrowing owl (*Athene cunicularia hypugaea*)	CDFG: Species of Special Concern Priority 2, BLM: Sensitive, USFWS: Bird of Conservation Concern	Found mainly in grassland and open scrub from the seashore to foothills. Also found in deserts and scrublands.	The northern portion of the Project area and vicinity is considered suitable western burrowing owl foraging and nesting habitat. Two burrows and a single owl were found in the proposed solar array disturbance area during reconnaissance surveys, and eight owls were detected during protocol burrowing owl surveys.	Present	Low
Ferruginous hawk (*Buteo regalis*)	CDFG: Watch List (wintering)	Open country, primarily plains, prairies, badlands, sagebrush, shrubland, desert.	The species is known to winter in the Colorado River Valley. They are most often seen in agricultural fields around Blythe, but occasionally in the open desert as well. There is no breeding habitat on site.	Low (non-breeding only)	Low (non-breeding only)

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]
Swainson's hawk (*Buteo swainsoni*)	CESA: Threatened, USFWS: Bird of Conservation Concern, USFS: Sensitive	Nesting habitat consists of open habitats with trees, either isolated, scattered or in windrows.	Migrants more frequently occur near western edge of desert such as Borrego and Morongo valleys, as reflected in annual data from the various regional hawk-watch reports. No suitable breeding habitat exists on site.	Low (non-breeding only)	Low (non-breeding only)
Gilded flicker (*Colaptes chrysoides*)	CESA: Endangered, USFWS: Bird of Conservation Concern	Found in habitats with giant cactus, Joshua trees (Yucca brevifolia), and riparian groves in desert lowlands and foothills (AOU 1995).	Within California, now confined to a small area of Joshua tree woodland in the eastern Mojave Desert (Cima Dome).	None	None
Yellow warbler (*Dendroica petechia sonorana*)	CDFG: Species of Special Concern, USFWS: Bird of Conservation Concern	Found along mature riparian woodlands that consist of cottonwood, willow, alder, and ash trees.	There is no breeding habitat for this species based on breeding range, but migrants are recorded in the vicinity and migratory habitat is expected to be present on site.	Low (non-breeding only)	Low (non-breeding only)
Loggerhead shrike (*Lanius ludovicianus*)	CDFG: Species of Special Concern Priority 2, USFWS: Bird of Conservation Concern	Occurs in semi-open country with utility posts, wires, and trees to perch on.	Suitable habitat occurs throughout the Project vicinity. Although declining over most of the range in California and elsewhere and now absent over large areas, this species is still common in the California deserts.	Present	Present
Gila Woodpecker (*Melanerpes uropygialis*)	CESA: Endangered, USFWS: Bird of Conservation Concern	Requires live tree-size cactus or dead trees (Winkler et al. 1995).	Nearest occupied habitat is near Blythe on the Colorado River.	Low	Low
Vermilion flycatcher (*Pyrocephalus rubinus*)	CDFG: Species of Special Concern	Open farmlands, shrubby grasslands, and streamsides and small wooded ponds in desert habitat. Found in diverse areas near open water.	Some suitable habitat is present within the agricultural areas of the Project, but available surface water is mainly restricted to irrigation channels.	Moderate	Low
Crissal thrasher (*Toxostoma crissale*)	CDFG: Species of Special Concern Priority 3	Occurs in dense riparian and mesquite scrub, microphyll woodland, and riparian washes with a dense understory of shrubs	Some habitat present that could support species foraging but not typical for nesting.	Low	Moderate

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]
Le Conte's thrasher (*Toxostoma lecontei*)	CDFG: Species of Special Concern, USFWS: Bird of Conservation Concern	Arid and open plains that are sparsely vegetated and dominated by saltbush and creosote bush	Suitable habitat for this species is present mainly in the creosote bush areas of the Project. Two individuals were detected in the proposed transmission line disturbance area.	High	Present
Mammals					
Pallid bat (*Antrozous pallidus*)	CDFG: Species of Special Concern	This gregarious species usually roosts in small colonies in rock crevices and buildings, but may nest in caves, mines, rock piles and tree cavities.	Roosting habitat for pallid bats is present in tree cavities in desert riparian woodland wash in the southeastern portion of the site. The closest documented occurrence in the CNDDB is from 1992, approximately 30 miles to the southwest of the airport near Corn Springs.	Low	Low
California leaf-nosed bat (*Macrotus californicus*)	CDFG: Species of Special Concern, BLM: Sensitive, USFS: Sensitive	Lowland desert scrub, desert riparian and wash areas, alkali scrub, or palm oases. Requires rugged or rocky terrain with mines or caves for roosting.	Suitable foraging habitat is present throughout the Project area, although roosting habitat is limited in the immediate region. A 2002 CNDDB record lists a colony of bats in the general vicinity (in the Roosevelt Mine quad), but specific location information is suppressed and it is unclear which species of bat may be present.	Low	Low
Arizona myotis (*Myotis occultus*)	CDFG: Species of Special Concern	Lowlands of the Colorado River and adjacent desert mountain ranges. Roosts in tree hollows, rock crevices, and similar areas.	The closest documented occurrence in the CNDDB is from 1942, approximately 5 miles south of the Project.	Low	Low
Cave myotis (*Myotis velifer*)	CDFG: Species of Special Concern, BLM: Sensitive	Low elevation arid regions near the Colorado River and in adjacent mountains. Requires caves or mines for roosting.	Suitable foraging habitat is present throughout the Project area, although roosting habitat is limited in the immediate region. A 2002 CNDDB record lists a colony of bats in the general vicinity (in the Roosevelt Mine quad), but specific location information is suppressed and it is unclear which species of bat may be present.	Low	Low
Nelson's bighorn sheep (*Ovis canadensis nelson*)	BLM: Sensitive	Mountain slopes with sparse growth of trees above the desert floor in California.	Nelson's bighorn sheep is known within the region. While the species is generally associated with mountainous areas, desert floor areas are important for dispersal and seasonal movement. A bighorn sheep skull was found in the proposed solar array area.	Low	Low

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array[2]	Potential for Occurrence within the Transmission Line (BLM Jurisdiction)[2]
American badger (*Taxidea taxus*)	CDFG: Species of Special Concern	Coastal sage scrub, mixed chaparral, grassland, oak woodland, chamise chaparral, mixed conifer, pinyon-juniper, desert scrub, desert wash, montane meadow, open areas, and sandy soils.	Suitable badger habitat occurs throughout the vicinity in undeveloped areas. Badger is present in adjacent areas surveyed for other projects (CEC 2009). Suitable burrows were observed within the Project area.	High	High
Desert kit fox (*Vulpes macrotis arsipus*)	Calif. Code of Regulations: PFM	Suitable habitat for this fossorial mammal consists of arid open areas, shrub grassland, and desert ecosystems.	Suitable kit fox habitat occurs throughout the vicinity in undeveloped areas. Kit fox is present in adjacent areas surveyed for other projects (CEC 2009).	High	High
Fish					
Razorback sucker (Xyrauchen texanus)	ESA: Endangered, CESA: Endangered, CDFG: Fully Protected	Colorado River. Uses both quiet and swift waters and spawns in shallow water where there is abundant sand, gravel, and rocks.	There is no suitable habitat to support this species within the Project area.	None	None

Federal Endangered Species Act (ESA)
State California Department of Fish and Game (CDFG)
California Endangered Species Act (CESA)
BLM Sensitive

[2] Species Potential for Occurrence

Low Potential –low potential to occur because suitable habitat present, but of marginal quality
Moderate Potential –moderate potential to occur because suitable habitat present; not found during surveys
High Potential –high potential to occur because suitable habitat present, and species known to occur within the vicinity; not found during surveys
Present – Species detected during Project surveys on adjacent areas.

APPENDIX A – PLANT SPECIES OBSERVED DURING SURVEYS

Scientific Name	Common Name	Observed in Solar Array	Observed in Transmission Line
ANGIOSPERMS (DICOTYLEDONS)			
AMARANTHACEAE	**AMARANTH FAMILY**		
Tidestromia oblongifolia	honeysweet	X	X
APIACEAE	**CARROT FAMILY**		
Lomatium sp.	lomatium	X	X
ASCLEPIADACEAE	**MILKWEED FAMILY**		
Asclepias sp.	milkweed	X	
Asclepias subulata	rush milkweed		X
Sarcostemma cynanchoides ssp. hartwegii	climbing milkweed		X
ASTERACEAE	**SUNFLOWER FAMILY**		
Ambrosia dumosa	burro bush	X	X
Baileya pauciradiata	Colorado Desert marigold		X
Bebbia juncea	sweetbush		X
Chaenactis sp.	pincushion	X	
Chaenactis stevioides	desert pinchushion		X
Dicoria canescens	bugseed	X	X
Geraea canescens	desert sunflower	X	X
Hymenoclea salsola	cheesebush		X
Palafoxia arida	Spanish needles	X	X
Pluchea sericea	arrow weed	X	
Stephanomeria pauciflora	wire lettuce	X	X
BORAGINACEAE	**BORAGE FAMILY**		
Cryptantha sp.	cryptantha	X	X
Cryptantha angustifolium	narrowleaf cryptantha		X
Cryptantha costata	ribbed cryptantha		X
Cryptantha maritime	Guadalupe cryptantha		X
Cryptantha nevadensis	cryptantha		X
Cryptantha pterocarya	wing nut cryptantha		X
Nama demissum	purple desert mat		X
Pectocarya sp.	pectocarya	X	X
Tiquilia palmeri	Palmer's tiquilia	X	
Tiquilia plicata	plicate tiquilia	X	X
BRASSICACEAE	**MUSTARD FAMILY**		
*Brassica tournefortii**	Sahara mustard	X	X
*Buxus microphylla**	Japanese box	X	
Lepidium sp.	peppergrass	X	X
Lepidium lasiocarpum	peppergrass		X
Simmondsia chinensis	jojoba	X	
CASUARINACEAE	**SHE OAK FAMILY**		
Casuarina sp.*	she oak	X	
CACTACEAE	**CACTUS FAMILY**		
Cylindropuntia echinocarpa	golden cholla		X
Mammillaria sp.	fish-hook cactus		X
CHENOPODIACEAE	**GOOSEFOOT FAMILY**		

Scientific Name	Common Name	Observed in Solar Array	Observed in Transmission Line
Atriplex canescens	four-wing saltbush	X	
Atriplex lentiformis	quail brush	X	
*Bassia hyssopifolia**	five-hooked bassia	X	
Salsola tragus	Russian thistle		X
CUCURBITACEAE	**GOURD FAMILY**		
Cucurbita sp.*	squash	X	
EUPHORBIACEAE	**SPURGE FAMILY**		
Stillingia spinulosa	annual stillingia		X
FABACEAE	**LEGUME FAMILY**		
Acacia greggii	cat claw acacia	X	X
Astragalus sp.	astragalus	X	
Cercidium floridum	palo verde	X	X
Dallea mollissima	downy dalea		X
*Medicago sativa**	alfalfa	X	
Olneya tesota	desert ironwood		X
Prosopis sp.	mesquite	X	
Prosopis glandulosa	Honey mesquite		X
Psorothamnus emoryi	indigobush		X
Psorothamnus schottii	indigobush	X	X
GERANIACEAE	**GERANIUM FAMILY**		
*Erodium cicutarium**	red-stemmed filaree	X	X
LOASACEAE	**LOASA FAMILY**		
Eucnide urens	rock nettle	X	
Mentzelia sp.	blazing star	X	X
Mentzelia multiflora	blazing star		
Petalonyx thurberi ssp. thurberi	sandpaper plant		X
MARTYNIACEAE	**UNICORN PLANT FAMILY**		
Proboscidea althaeifolia	desert unicorn plant	X	
MYRTACEAE	**MYRTLE FAMILY**		
Eucalyptus sp.*	gum tree	X	X
NYCTAGINACEAE	**FOUR O'CLOCK FAMILY**		
Abronia villosa	sand verbena	X	
ONAGRACEAE	**EVENING PRIMROSE FAMILY**		
Camissonia boothii	bottlebrush primrose	X	X
Oenothera deltoids ssp. deltoides	bird-cage primrose		X
PLANTAGINACEAE	**PLANTAIN FAMILY**		
Plantago erecta	western plantain	X	
Plantago ovata	wooly plantain		X
POLEMONIACEAE	**PHLOX FAMILY**		
Eriastrum harwoodii	Harwood's woollystar		X
Gilia sp.			X
Langloisia setosissima	lilac sunbonnet		X
POLYGONACEAE	**BUCKWHEAT FAMILY**		
Chorizanthe brevicornu	brittle spineflower		X
Chorizanthe rigida	rigid spineflower	X	X
Eriogonum sp.			X
RESDACEAE	**MIGNONETTE FAMILY**		

Scientific Name	Common Name	Observed in Solar Array	Observed in Transmission Line
Oligomeris linifolia	Narrow-leaf oligomeris		X
ROSACEAE	**ROSE FAMILY**		
*Prunus persica**	peach	X	
RUTACEAE	**RUE FAMILY**		
*Citrus limon**	lemon	X	
*Citrus sinensis**	orange	X	
TAMARICACEAE	**TAMARISK FAMILY**		
*Tamarix ramosissima**	Mediterranean tamarisk	X	
VISCACEAE	**MISTLETOE FAMILY**		
Phoradendron californicum	desert mistletoe	X	
ZYGOPHYLLACEAE	**CALTROP FAMILY**		
Larrea tridentata	creosote bush	X	X
ANGIOSPERMS (MONOCOTYLEDONS)			
ARECACEAE	**PALM FAMILY**

APPENDIX B – WILDLIFE SPECIES OBSERVED DURING RECONNAISSANCE AND FOCUSED SURVEYS

Scientific Name	Common Name	Observed in Reconnaissance Survey	Observed in Focused Survey
CLASS INSECTA	**INSECTS**		
MELOIDAE	**BLISTER BEETLES**		
Lytta auriculata	red-eared blister beetle	X	X
TENEBRIONIDAE	**DARKLING BEETLES**		
Asbolus verrucosus	desert ironclad beetle	X	X
Eleodes spinipes	darkling beetle	X	
MANTIDAE	**MANTIDS**		
Litaneutria minor	ground mantis	X	
PIERIDAE	**WHITE & SULPHUR BUTTERFLIES**		
Pieris rapae	cabbage white	X	
Pontia protodice	checker-white		X
NYMPHALIDAE	**BRUSH-FOOTED BUTTERFLIES**		
Vanessa virginiensis	Virginia lady	X	
LYCAENIDAE	**GOSSAMER WING BUTTERFLIES**		
Brephidium exilis	pygmy blue	X	
FORMICIDAE	**ANTS**		
Messor pergandei	desert harvester ant	X	
MUTILLIDAE	**VELVET ANTS**		
Dasymutilla sp.	velvet ant	X	X
POMPILIDAE	**SPIDER WASPS**		
Pepsis formosa	tarantula wasp	X	X
CLASS REPTILIA	**REPTILES**		
TRIONYCHIDAE	**SOFTSHELL TURTLES**		
Apalone spinifera	spiny softshell turtle	X	
IGUANIDAE	**IGUANID LIZARDS**		
Callisaurus draconoides draconoides	common zebra-tailed lizard	X	X
Dipsosaurus dorsalis	desert iguana	X	X
Phrynosoma sp.	horned lizard	X	
Uma scoparia	Mojave fringe-toed lizard	X	X
Uta stansburiana	common side-blotched lizard	X	X
TEIIDAE	**WHIPTAIL LIZARDS**		
Cnemidophorus sp.	whiptail	X	X
COLUBRIDAE	**COLUBRID SNAKES**		
Arizona elegans occidentalis	Glossy snake		X
Chinoactis occipitalis	shovel-nosed snake	X	
VIPERIDAE	**VIPERS**		
Crotalus cerastes	sidewinder	X	X

Scientific Name	Common Name	Observed in Reconnaissance Survey	Observed in Focused Survey
CLASS AVES	**BIRDS**		
CATHARTIDAE	**NEW WORLD VULTURES**		
Cathartes aura	turkey vulture	X	X
ACCIPITRIDAE	**HAWKS, KITES, EAGLES**		
Buteo jamaicensis	red-tailed hawk	X	
FALCONIDAE	**FALCONS**		
Falco sparverius	American kestrel	X	
ODONTOPHORIDAE	**NEW WORLD QUAIL**		
Callipepla gambelii	Gambel's quail	X	X
CHARADRIIDAE	**PLOVERS**		
Charadrius vociferus	killdeer	X	
COLUMBIDAE	**PIGEONS & DOVES**		
Columba livia	rock pigeon	X	
Streptopelia risoria	ringed turtle-dove	X	
Zenaida aurita	white-winged dove	X	X
Zenaida macroura	mourning dove	X	
CUCULIDAE	**CUCKOOS & ROADRUNNERS**		
Geococcyx californianus	greater roadrunner	X	X
STRIGIDAE	**TRUE OWLS**		
Athene cunicularia	burrowing owl	X	
APODIDAE	**SWIFTS**		
Aeronautes saxatalis	white-throated swift	X	
TYRANNIDAE	**TYRANT FLYCATCHERS**		
Tyrannus verticalis	western kingbird	X	X
ALAUDIDAE	**LARKS**		
Eremophila alpestris	horned lark	X	X
HIRUNDINIDAE	**SWALLOWS**		
Petrochelidon pyrrhonota	cliff swallow	X	
CORVIDAE	**JAYS & CROWS**		
Corvus corax	common raven	X	X
LANIIDAE	**SHRIKES**		
Lanius ludovicianus	loggerhead shrike	X	X
STURNIDAE	**STARLINGS**		
Sturnus vulgaris	European starling	X	
ICTERIDAE	**BLACKBIRDS**		
Agelaius phoeniceus	red-winged blackbird	X	
Euphagus cyanocephalus	Brewer's blackbird	X	
Icterus cucullatus	hooded oriole		X
Xanthocephalus xanthocephalus	yellow-headed blackbird	X	
Quiscalus mexicanus	great-tailed grackle	X	X

Scientific Name	Common Name	Observed in Reconnaissance Survey	Observed in Focused Survey
MIMIDAE	**MOCKINGBIRDS & THRASHERS**		
Toxostoma lecontei	Le Conte's thrasher		X
THRAUPIDAE	**TANAGERS**		
Piranga ludoviciana	Western tanager		X
SYLVIIDAE	**GNATCATHERS**		
Polioptila caerulea	black-tailed gnatcatcher		X
EMBERIZIDAE	**EMBERIZIDS**		
Zonotrichia leucophrys	white-crowned sparrow	X	
FRINGILLIDAE	**FINCHES**		
Carduelis tristis	American goldfinch	X	
CLASS MAMMALIA	**MAMMALS**		
LEPORIDAE	**HARES & RABBITS**		
Lepus californicus	black-tailed jackrabbit	X	
Sylvilagus audubonii	desert cottontail	X	
SCIURIDAE	**SQUIRRELS**		
Ammospermophilus leucurus	white-tailed antelope squirrel	X	X
Spermophilus tereticaudus	Round-tailed ground squirrel		X
HETEROMYIDAE	**POCKET MICE & KANGAROO RATS**		
Dipodomys sp.	kangaroo rat	X	
CANIDAE	**WOLVES & FOXES**		
Canis familiaris	domestic dog	X	
Canis latrans	coyote	X	
Vulpes macrotis	kit fox	X	X
MUSTELIDAE	**WEASELS, SKUNKS & OTTERS**		
Taxidea taxus	American badger	X	
BOVIDAE	**BISON, GOATS & SHEEP**		
Ovis canadensis	bighorn sheep	X (bones and skull)	
CHIROPTERA	**BATS**		
Myotis sp.	Myotis	X	X

1.0 INTRODUCTION

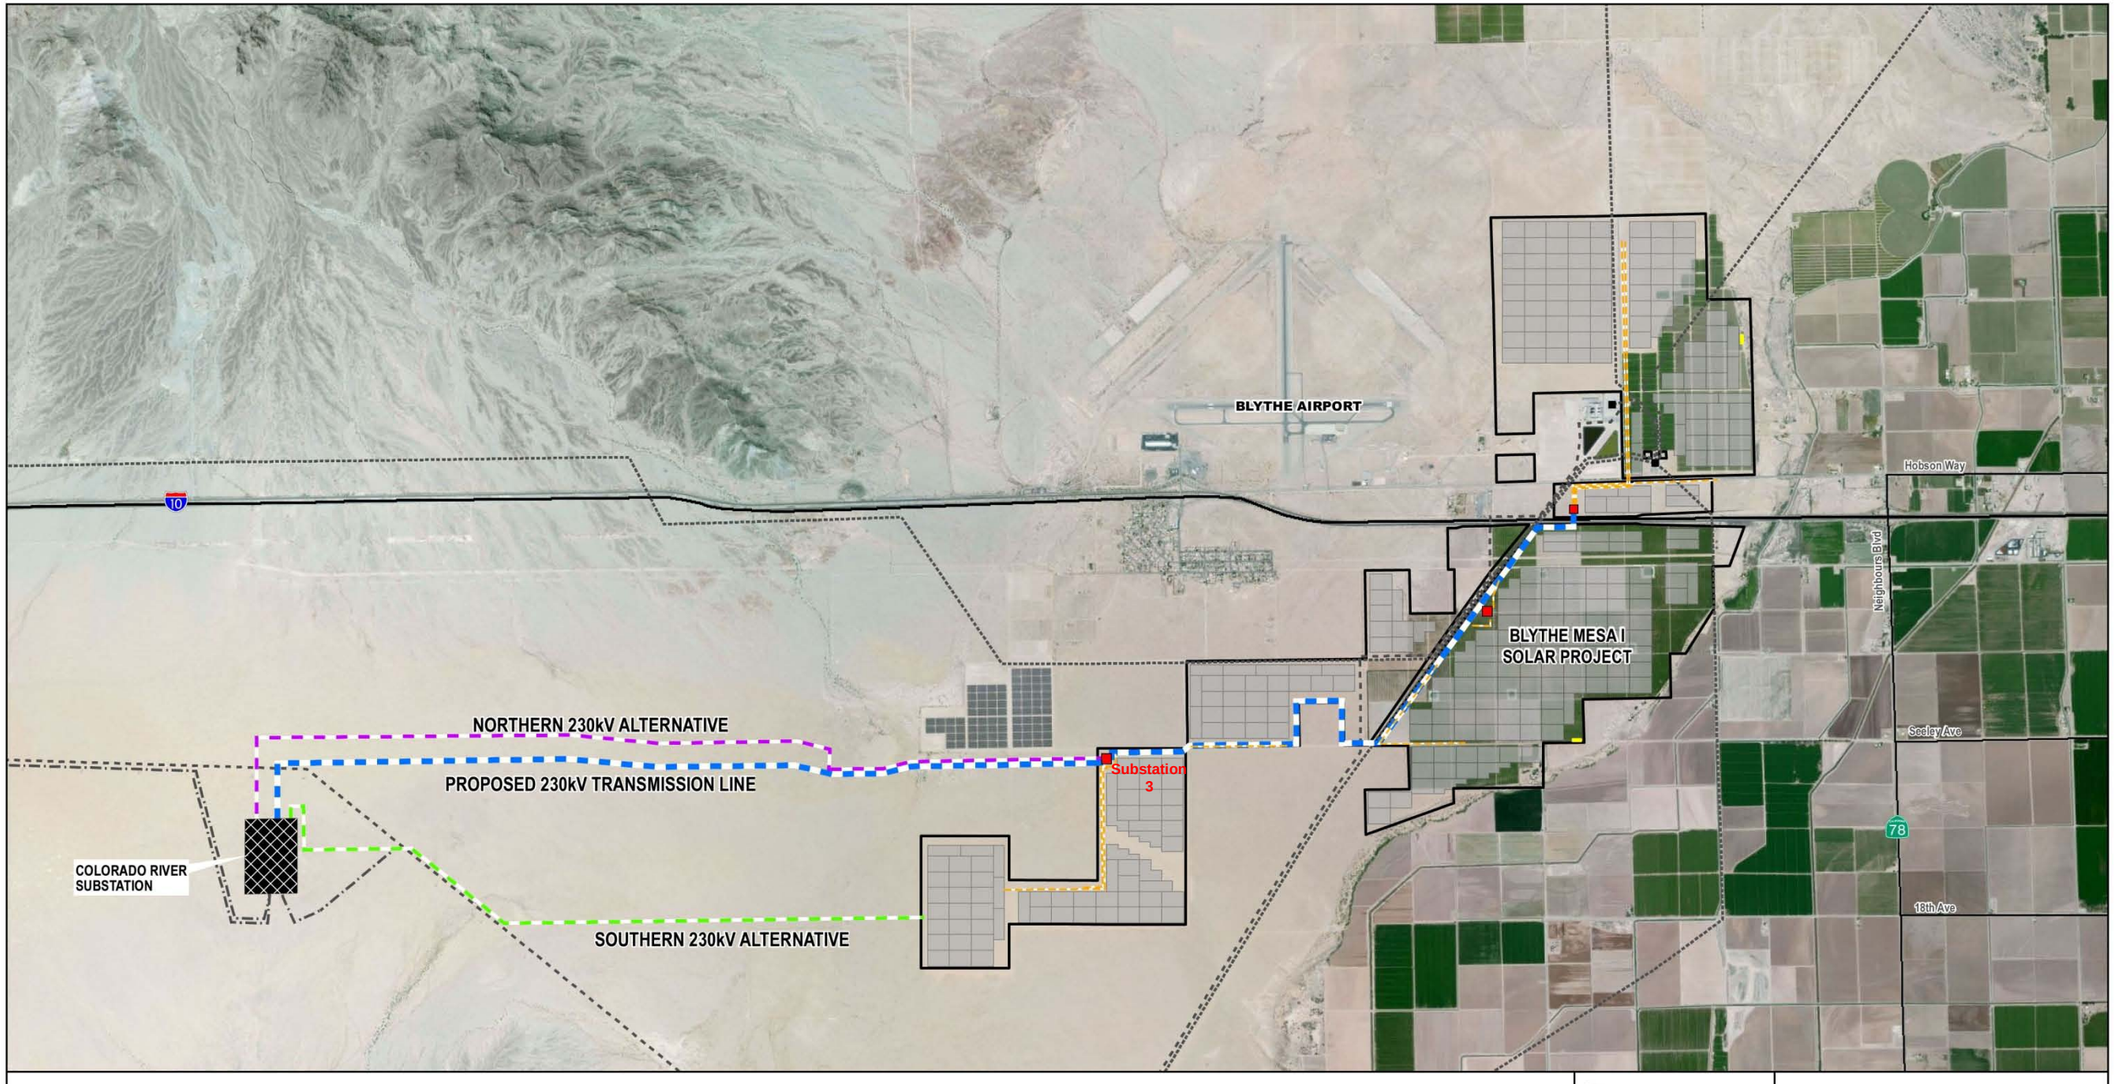
The proposed Blythe Mesa Solar Project (Project) consists of construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure and connection to the statewide electricity transmission grid. In 2011, a Habitat Assessment, Protocol Rare Plant Surveys, and burrowing owl surveys were conducted on the solar array field and proposed 8.4-mile 230 kilovolt (kV) transmission line (73 acres). Two new transmission line corridor alternatives, a Northern Alternative and a Southern Alternative to the proposed alignment, were introduced in 2012. This report documents the results of the habitat assessment that was conducted on the new 230 kV alternatives. The habitat assessment consisted of a review of published peer-reviewed documents, databases, and biological reports in conjunction with biological field surveys. This data was used to determine areas that have suitable habitat to potentially support listed, proposed for listing, and candidate threatened and endangered species, and other identified sensitive species.

1.1 Project Overview

The Proposed Project is a 485 MW PV electrical generating facility and 230 kV transmission line that would occupy a total of 3,660 acres. The Proposed Project would produce enough energy to power approximately 180,000 households, and would consist of the following two major components: 1) a solar array field utilizing single-axis solar PV trackers (3,587 acres); and 2) 8.4 miles of 230 kV transmission (4.2 miles of this line would be located outside of the solar array site within a 125-foot-wide Right-of-Way (ROW) totaling approximately 73 acres).

This habitat assessment analyzes only the 230 kV northern and southern alternative transmission line alignments, as the proposed solar array field remains the same for all transmission alternatives. The 230 kV alternatives are described below and illustrated in Figure 1.

1.1.1 Northern Alternative 230 kV Transmission Line



Similar to the proposed alignment, the Northern Alternative would include the construction, operation, and decommissioning of a 485 MW solar PV electrical generating facility and associated infrastructure. It would occupy a total of 3,588 acres and would utilize the same solar array field as the Proposed Project. The primary difference between the Northern Alternative and the proposed Project is the location of the 230 kV transmission line that extends outside of the solar array field to the Colorado River Substation; the same 230 kV transmission alignment within the solar array field would be utilized for both the proposed Project and Northern Alternative. Both the Proposed alignment and the Northern Alternative would be located within the same BLM utility corridor; however, the Northern Alternative would be located on the north side of the corridor and within a 125-foot ROW entirely on BLM-managed lands. Under this alternative, the total length of the 230 kV transmission line both on-site and off-site would be 8.8 miles; 3.6 miles would be located on private lands within the array site boundary and 5.2 miles would be located entirely off-site on BLM-managed lands. The BLM portion of the ROW would contain 79 acres.

1.1.2 Southern Alternative 230 kV Transmission Line

Also similar to the proposed alignment, the Southern Alternative would include the construction, operation, and decommissioning of a 485 MW solar PV electrical generating facility and associated infrastructure. The Southern Alternative would occupy a total of 3,647 acres and would utilize the same solar array field location as the Proposed Project. The primary difference between the proposed Project and the Southern Alternative is the location of the 230 kV transmission line that extends between the solar array field to the Colorado River Substation. The Southern Alternative would exit the southwestern portion of the solar array field and extend approximately four miles west to the Colorado River Substation within a 125-foot ROW. To facilitate this alignment, an additional 10,000 feet of 230 kV transmission line would need to be built on the solar array field extending south from the proposed substation 3 and

angling west to the site boundary. The transmission line would continue westerly off-site across 3.4 miles of BLM-managed lands and 0.6 mile of private lands before reaching the Colorado River Substation. Under this alternative, the total length of the 230 kV transmission line both on-site and off-site would be 9.5 miles; 5.5 miles would be located on private lands within the array site boundary and 4.0 miles would be located off-site on private land. The total area of the ROW offsite would be about 60 acres (50 acres of BLM-managed land and 10 acres of private land).

FIGURE 1. SITE PLAN

THIS PAGE INTENTIONALLY LEFT BLANK

2.0 METHODS

Prior to initiating the reconnaissance survey, available data was reviewed from resource management plans and other relevant documents to determine the locations and types of biological resources that have the potential to exist within and adjacent to the biological resources survey area. The California Natural Diversity Database (CNDDB), maintained by the California Department of Fish and Game (CDFG 2012), and California Native Plant Society (CNPS) Electronic Inventory of Rare and Endangered Plants of California (CNPS 2012) were also accessed for records of occurrence of special-status species and habitats within the Roosevelt Mine, Ripley, McCoy Spring, McCoy Peak, McCoy Wash, Blythe NE, Blythe, Mule Wash, Palo Verde, Thumb Peak, Wiley Well, and Hopkins Well U.S. Geological Survey (USGS) 7.5-minute quadrangles. These search parameters encompass an approximately 10-mile buffer around the Project area.

Habitat mapping was conducted within the two alternative transmission line routes by POWER Engineers, Inc. (POWER) biologists Ken McDonald and Ryan Winkleman from May 1 through May 3, 2012. Surveys were commenced between 6:30 and 7:00 a.m., when temperatures were approximately 60-70° F. The biologists walked transects approximately 30 feet apart and noted vegetation communities, plant species observed, and wildlife observed or detected. Surveys were conducted within the 500-foot biological survey corridor. No pedestrian surveying was conducted outside of the ROW.

The habitat mapping survey was conducted to assess general and dominant vegetation types, community sizes, habitat types, and species present within communities. Community types were based on observed dominant vegetation composition and density. Vegetation communities were classified based on Holland (1986). Sawyer and Keeler-Wolf (1995), and CDFG classifications were used to provide additional detail when needed, such as denoting special vegetation communities that are either known or believed to be of high priority for inventory in CNDDB due to significance or rarity. Plants of uncertain identity were collected and subsequently identified from taxonomic keys (Hickman 1993) and field guides (Stuart & Sawyer 2001). Scientific and common species names were recorded according to The Jepson Manual: Higher Plants of California. A list of observed plant species is provided in Appendix D.

The presence of a wildlife species was based on direct observation, wildlife sign (e.g., tracks, burrows, nests, scat), or vocalization. Field data compiled for wildlife included the species scientific name, common name, and evidence of sign when no direct observations were made. Wildlife were identified and named based on field guides and other related literature (Burt & Grossenheider 1980, Elbroch 2003, Sibley 2000, and Stebbins 2003). A list of observed animal species is presented in Appendix E.

The potential for occurrence of special-status species was also determined for the biological survey area. The survey area was assessed in the field for its potential to support both common and special-status plant and animal species based on habitat suitability comparisons with reported occupied habitats.

3.0 RESULTS

3.1 Vegetation Communities

Three vegetation communities and other cover types were identified within the survey area during the reconnaissance and focused surveys (see Table 1 below and Appendix A). Vegetation communities are described in detail below and based on a classification system by R. Holland (1986). When appropriate, vegetation classification by J.O. Sawyer and T. Keeler-Wolf (1995) are also considered. Community types according to CDFG are listed where applicable. Of the vegetation communities listed in Table 1, desert dry wash woodland is considered sensitive. Desert dry wash woodland is sensitive because it is included with State waters under the jurisdiction of CDFG. In addition, desert dry wash woodland is a special community type (e.g., high priority for inventory in the CNDDB) per CDFG's Vegetation and

Mapping Program. The elevation of both alternative transmission line corridors ranges between 380 and 480 feet.

Table 1. Vegetation Communities and Cover Types (Acres)

Vegetation Communities and Other Cover Types	Acreage on Northern Alternative	Acreage on Southern Alternative
Sonoran Creosote Bush Scrub	303.07 acres	231.01 acres
Desert Dry Wash Woodland	22.87 acres	11.39 acres
Developed/Disturbed	0.51 acre	0.33 acre

Note: solar array field acreage is not included in this analysis.

Sonoran Creosote Bush Scrub. Sonoran creosote bush scrub is an open, sparsely vegetated community, usually with bare ground between plants, and is the most common vegetation community of the Sonoran desert. This community experiences growth during the winter and spring seasons, if rainfall is sufficient. Many annual species occur in early to late spring during years of adequate rainfall. Sonoran creosote bush scrub occurs on well-drained secondary soils of slopes, fans, and valleys, with thin residual soils or on sites with high soil salinity, and intergrades with Mojave creosote bush scrub. This plant community intergrades into the desert dry wash woodland community within the survey area.

Creosote bush (*Larrea tridentata*) is the dominant species within the Sonoran creosote bush scrub community observed with the survey area. Other species observed that varied from abundant to common within this community included burro bush (*Ambrosia dumosa*), big galleta grass (*Pleuraphis rigida*), and Sahara mustard (*Brassica tournefortii*). Within the survey area, this community is characterized by either sandy soils with pockets of stabilized desert sand fields, or by weakly developed desert pavement. In areas within the creosote bush scrub vegetation where the weakly developed desert pavement occurs, the topography is generally very flat, and plant species abundance and diversity is very low.

Approximately 303.07 acres of Sonoran creosote bush scrub occur within the survey area of the Northern Alignment, and 231.01 acres in the Southern Alignment.

Desert Dry Wash Woodland. Desert dry wash woodland is an open to dense, drought-deciduous microphyllous thorn scrub woodland, dominated by leguminous trees. This community occurs in sandy or gravelly washes and arroyos of the lower Mojave, Sonoran, and Colorado deserts, generally in areas that do not experience frost. These washes typically have braided channels that may be changed substantially with each surface flow event. This plant community intergrades into the Sonoran creosote bush scrub community within the survey area.

Where the observed washes were more obvious, Palo Verde (*Cercidium floridum*), honey mesquite (*Prosopis glandulosa*), and ironwood (*Olneya tesota*) were the dominant species, with abundant to common big galleta grass, burrobush, and Sahara mustard. As washes become more shallow and less obvious, the dominant species was big galleta grass and Sahara mustard. Other perennial and annual species were observed occasionally throughout this community.

Approximately 22.87 acres of desert dry wash woodland occur within the survey area of the Northern Alignment, and 11.39 acres in the Southern Alignment.

Developed/Disturbed. Developed and disturbed areas consist of dirt access roads, active or fallow agriculture, and areas mechanically cleared of native vegetation. Approximately 0.51 acre of developed/disturbed occurs within the survey area of the Northern Alignment, and 0.33 acre in the Southern Alignment.

3.2 Flora

This section discusses plant species detected or with potential to occur within the survey area. No federal-listed, State-listed, or other special-status plant species were observed within the biological survey area. In total, 15 plant species were determined to have a potential to occur within the vicinity of the Project, based on records searches with the CNDDB (CDFG 2012) and CNPS (2012) and reviews of documentation from other nearby projects, such as the Blythe Solar Power Project (AECOM 2010) and previous surveys in the vicinity conducted by POWER biologists. These include one BLM sensitive species and eight species listed as present within the area covered by the Northern & Eastern Colorado Desert (NECO) Plan (BLM and CDFG 2002). No federal- or State-listed plant species have the potential to occur within the Project area.

Plant species observed during the initial habitat mapping surveys are listed in Appendix D. Species most commonly observed during biological surveys included burro bush, Sahara mustard, creosote bush, and galleta grass. Other common species that occurred less frequently included four-wing saltbush (*Atriplex canescens*), Palo Verde, ironwood, Russian thistle (*Salsola tragus*), Mediterranean grass (*Schismus barbatus*), and devil's spineflower (*Chorizanthe rigida*).

Federal-listed Plant Species. No federal-listed plant species were detected within the survey area during spring 2012 habitat mapping surveys. Based on regional databases, no federal-listed as endangered plant species have potential to occur within the survey area (CNDDB 2012, CNPS 2012).

State-listed Plant Species. No State-listed plant species were detected within the survey area during 2012 habitat mapping surveys. Based on regional databases, no State-listed plant species were determined to have potential to occur within the survey area (CNDDB 2012, CNPS 2012).

BLM-listed Plant Species: Based on the BLM's Palm Springs Field Office list of sensitive plant species, only one BLM sensitive plant species is documented as being present in and adjacent to the Project area. Harwood's woolystar (*Eriastrum harwoodii*) was detected by POWER in 2011 in a potential transmission line corridor located between the northern and southern alternatives. It was not detected during POWER's 2012 habitat mapping surveys on the northern and southern alternatives.

Other Special-status Plant Species. No other special-status plant species were detected during habitat mapping surveys in spring 2012. Based on a CNDDB search, Harwood's milk-vetch (*Astragalus insularis* var. *harwoodii*), a CNDDB List 2.2 species, has a high potential to occur within the proposed transmission line disturbance area and has numerous records in the vicinity, with several that are within the immediate vicinity of the survey area.

Table 2 provides a summary of the special-status plant species with the potential to occur within the Project area.

THIS PAGE INTENTIONALLY LEFT BLANK

Table 2. Special-status Plant Species with Potential to Occur within the Project Area

Common Name Scientific Name	Sensitivity Status[1]	Plant Habit and General Habitat Description (CNPS 2012)	Flowering Period (CNPS 2012)	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Angel trumpets *(Acleisanthes longiflora)*	CNPS: List 2.3 NECO Plan	Prostrate to ascending perennial stems less than three feet. Occurs in dry places, generally on carbonate or limestone derived soils in mountainous areas 30 to 8,000 feet.	May	The closest record of this species is in the Big Maria Mountains.	Low	Low
Harwood's milkvetch *(Astragalus insularis* var. *harwoodii)*	CNPS: List 2.2 NECO Plan	Annual plant. Occurs in the Sonoran Desert in sandy to gravely areas 0 to 1,000 feet.	January to May	This species was detected in the Project vicinity toward the northwestern limits in 2009 (CEC).	High	High
Gravel milkvetch (*Astragalus sabulonum*)	CNPS List 2.2	Annual and perennial herb. Occurs in desert dunes and Mojavean and Sonoran desert scrub in sandy or gravelly areas. Also in washes or along roadsides. Occurs between 195 and 3,050 feet.	February to June	The closest CNDDB record is approximately 1.5 miles north of the Project area in a "best guess" location.	Moderate	Moderate
Pink fairyduster *(Calliandra eriophylla)*	CNPS: List 2.3 NECO Plan	Shrubs less than one foot in height. Occurs in Sonoran Desert, sandy washes, slopes, and mesas typically between 390 and 5,000 feet.	January to March	Some suitable habitat is present. Species most often occurs at sites above 500 feet.	Low	Low
Saguaro (*Carnegiea gigantea*)	CNPS: List 2.2 NECO Plan	Perennial stem succulent. Occurs in Sonoran desert scrub in rocky areas, typically between 165 and 4,920 feet.	May to June	The only CNDDB record is approximately 15 miles south of the Project area.	None	None
Crucifixion horn *(Castela emoryi)*	CNPS: List 2.3 NECO Plan	Shrub less than 10 feet in height. Occurs in Mojavean and Sonoran desert scrub on dry, gravelly washes from 295 to 3,000 feet.	April to May	This large shrub was not observed in the surveys, which were conducted within the appropriate blooming period.	None	None
Abrams' spurge *(Chamaesyce abramsiana)*	CNPS: List 2.2	Annual herb. Occurs in Mojavean and Sonoran desert scrub on sandy soils up to 3,000 feet.	September to November	The only CNDDB record is approximately 9.5 miles west of the Project area.	Moderate	Moderate
Las Animas colubrine *(Colubrina californica)*	CNPS: List 2.3 NECO Plan	Perennial, deciduous shrub generally less than three feet. Occurs in Sonoran creosote bush scrub less than 3,500 feet.	April to June	According to CEC 2009 data, specimens were observed in flower during April; an early blooming period for this species. Similar habitat is expected to occur in the Project area.	Moderate	Moderate
Alverson's foxtail cactus (*Coryphantha alversonii*)	CNPS: List 4.3 NECO Plan	Perennial stem succulent. Occurs in sandy, rocky, or granitic areas of Mojavean and Sonoran desert scrub, usually from 245 to 5,005 feet.	April to June	All CNDDB records are mapped north of Blythe in the Big Maria Mountains.	Low	Low

Common Name Scientific Name	Sensitivity Status[1]	Plant Habit and General Habitat Description (CNPS 2012)	Flowering Period (CNPS 2012)	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Harwood's woollystar *(Eriastrum harwoodii)*	CNPS: List 1B.2 BLM: Sensitive	Annual herb. Occurs in desert dunes and Sonoran Desert scrub on sandy soils from 400 to 3,000 feet.	March to June	Observed in abundance in an area between the northern and southern alternatives in 2011. Not observed in 2012.	High	High
Bitter hymenoxys *(Hymenoxys odorata)*	CNPS: List 2	Annual herb. Occurs in chaparral, coastal scrub, Mojavean Desert scrub, and meadows and seeps, often in alkali soils, and riparian scrub with mesic soils. Most often found on sandy sites from 145 to 490 feet.	February to November	Habitat for this species is limited to the desert riparian woodland wash located in the easternmost portion of the proposed transmission line.	Low	Low
California satintail *(Imperata brevifolia)*	CNPS: List 2.1	Perennial grass. Occurs in San Bernardino Mountains and Mojave Desert in cultivation. Found near wet springs, meadows, streamsides and flood plains up to 1,700 feet.	September to May	The habitat for this species (wet springs, meadows, stream sides and flood plains) does not occur within the Project area.	Low	Low
Darlington's blazing star (*Mentzelia puberula*)	CNPS: List 2.2	Perennial herb. Occurs in sandy or rocky areas of Mojavean and Sonoran desert scrub, between 295 and 4,200 feet.	March to May	The only CNDDB record is approximately 14.5 miles south of the Project area.	Low	Low
Wiggins' cholla (*Opuntia wigginsii*)	CNPS: List 3.3 NECO Plan	Perennial stem succulent. Occurs in sandy Sonoran desert scrub from 100 to 2,905 feet.	March	The only CNDDB record is approximately 13.75 miles south of the Project area.	Low	Low
Dwarf germander *(Teucrium cubense* ssp. *depressum)*	CNPS: List 2.2	Annual plant up to six inches tall. Occurs in sandy soils, washes and fields in the Sonoran Desert below 1,200 feet.	March to November	Habitat for this species is present within the Project area and vicinity.	Moderate	Moderate

[1]Sensitivity Status Key

ESA Endangered
CNPS California Native Plant Society Lists:
1B: Considered rare, threatened, or endangered in California and elsewhere.
2: Plants rare, threatened, or endangered in California, but more common elsewhere
Decimal notations: .1 - Seriously endangered in California, .2 – Fairly endangered in California, .3 – Not very endangered in California
BLM Special-Status Plants
NECO Plan Northern and Eastern Colorado Desert Coordinated Management Plan special-status species

[2]Species Potential for Occurrence

Low – low potential to occur, because suitable habitat was observed, but was of marginal quality, or the area may be at the limits of the known ranges, and the species was not observed during the survey.
Moderate – has moderate potential to occur because suitable habitat was observed to be present, but the species was not found during focused plant surveys
High – has high potential to occur because suitable habitat was present, and species is known to occur within the vicinity, but it was not found during focused plant surveys
Present – if detected during surveys

3.3 Wildlife

This section discusses special-status wildlife species detected within the survey area or with potential to occur on site. Thirty-two special-status wildlife species were determined to have the potential to occur within the Project area or its vicinity. In total, 35 wildlife species or their sign were detected during the habitat mapping surveys (see Appendix E). Of these, three special-status wildlife species or their sign were observed within the survey area (see Table 3), including Mojave fringe-toed lizard, loggerhead shrike, and desert kit fox. In addition, a thrasher species was detected by call but was not identified. In total, five insect, seven reptile, 17 bird, and six mammal species or their sign were detected during biological surveys.

Wildlife species observed during the survey are listed in Appendix E. The species most commonly observed during biological surveys included Mojave fringe-toed lizard (*Uma scoparius*), western whiptail (*Aspidoscelis tigris*), Wilson's warbler (*Wilsonia pusilla*), round-tailed ground squirrel (*Spermophilus tereticaudus*), desert ironclad beetle (*Asbolus verrucosus*), and tarantula hawk (*Pepsis formosa*).

Table 3 provides a summary of the species accounts and potential to occur. Habitat requirements are taken primarily from the CNDDB (CDFG 2012) and sensitivity status is current to the 2011 CDFG Special Animals List (CDFG 2011).

Federal-listed Wildlife Species: No federal-listed wildlife species or their sign were detected during surveys. Based on a CNDDB (CDFG 2012) search, four federal-listed species and one federal candidate species have records in the Project vicinity. These include desert tortoise (*Gopherus agassizii*), southwestern willow flycatcher (*Empidonax traillii extimus*), Yuma clapper rail (*Rallus longirostris yumanensis*), razorback sucker (*Xyrauchen texanus*), and the candidate species western yellow-billed cuckoo (*Coccyzus americanus occidentalis*).

State-listed Wildlife Species: No State-listed wildlife species or their sign were detected during surveys. Based on a CNDDB (CDFG 2012) search, seven State-listed species have records in the Project vicinity. These include desert tortoise, western yellow-billed cuckoo, southwestern willow flycatcher, Gila woodpecker (*Melanerpes uropygialis*), elf owl (*Micrathene whitneyi*), Yuma clapper rail, and razorback sucker.

BLM-listed Wildlife Species: One BLM sensitive species was detected during POWER's 2012 habitat mapping surveys. Mojave fringe-toed lizard was detected on the northern alternative, but was not detected on the southern alternative. However, based on habitat present in the southern alternative and the large number of Mojave fringe-toed lizards that POWER detected in 2011 in a proposed transmission line corridor located between the northern and southern alternatives, this species has a high potential to occur on the southern alternative.

Other Special-Status Wildlife Species: Two other special-status wildlife species or their sign were positively identified on site, including the loggerhead shrike (*Lanius ludovicianus*) and desert kit fox (*Vulpes macrotis arsipus*). In addition, an unidentified thrasher species (*Toxostoma* sp.) was detected aurally during surveys.

THIS PAGE INTENTIONALLY LEFT BLANK

Table 3. Special-status Wildlife Species with Potential to Occur within the Project Area

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Amphibians					
Couch's spadefoot toad (*Scaphiopus couchii*)	CDFG: Species of Special Concern BLM: Sensitive NECO Plan	Various arid and semiarid environments. Breeds in desert ponds quickly following rainfall.	Suitable habitat is not known to be present, but some areas may still support ponded water after rain events.	Low	Low
Reptiles					
Desert tortoise (*Gopherus agassizii*)	ESA: Threatened CESA: Threatened NECO Plan	Various desert scrubs and desert washes up to about 5,000 feet, but not including playas.	Desert tortoise was documented approximately 0.5 mile south of the southern alignment (CH2M Hill 2010) and sign was scattered around the Colorado River Substation (AECOM 2010). POWER walked transects along both alternatives in suitable habitat but did not observe desert tortoise or its sign.	Low	Moderate
Mojave fringe-toed lizard (*Uma scoparia*)	CDFG: Species of Special Concern BLM: Sensitive NECO Plan	Fine, wind-blown sand in creosote bush scrub of the Mojave and northern Colorado Deserts. From below sea level to 2,952 feet.	Species detected in the northern alternative during habitat mapping. Suitable habitat is present within the southern alternative, though no individuals were detected during the survey.	Present	High
Birds					
Western burrowing owl (*Athene cunicularia hypugaea*)	CDFG: Species of Special Concern BLM: Sensitive USFWS: Bird of Conservation Concern NECO Plan	Found mainly in grassland and open scrub from the seashore to foothills. Also found in deserts and scrublands.	Habitat marginally suitable for this species. May be occasionally present as foragers but unlikely to be present as residents.	High	High

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)	ESA: Candidate CESA: Endangered USFWS: Bird of Conservation Concern	Nests along large river systems, typically in areas dominated by willows and cottonwoods.	No suitable habitat observed in Project area.	None	None
Sonoran yellow warbler (*Dendroica petechia sonorana*)	CDFG: Species of Special Concern USFWS: Bird of Conservation Concern NECO Plan	Occurs in riparian deciduous habitat, such as cottonwood and willow areas, nesting in understories. Summer resident of the Colorado River Valley.	No suitable habitat observed in Project area.	None	None
Southwestern willow flycatcher (*Empidonax traillii extimus*)	ESA: Endangered CESA: Endangered NECO Plan	Riparian woodlands.	No suitable habitat observed in Project area.	None	None
Yellow-breasted chat (*Icteria virens*)	CDFG: Species of Special Concern	Inhabits riparian willow thickets near watercourses. Nests in low, dense riparian areas. Summer resident.	No suitable habitat observed in Project area.	None	None
Loggerhead shrike (*Lanius ludovicianus*)	CDFG: Species of Special Concern USFWS: Bird of Conservation Concern	Occurs in semi-open country with utility posts, wires, and trees to perch on.	Pair detected just north of the northern alternative. Suitable habitat occurs along the southern alternative but no individuals were detected.	Present	High
Gila Woodpecker (*Melanerpes uropygialis*)	CESA: Endangered USFWS: Bird of Conservation Concern NECO Plan	Nests in cottonwoods or other desert riparian trees, shade trees, or date palms.	Limited suitable habitat available in the Project area. Nearest occupied habitat is near Blythe on the Colorado River.	Low	Low

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Elf owl (*Micrathene whitneyi*)	CESA: Endangered USFWS: Bird of Conservation Concern NECO Plan	In California, nests only in cottonwood-willow and mesquite riparian areas along the Colorado River.	No suitable nesting habitat in Project area. May forage in or near the Project area.	Low	Low
Summer tanager (*Piranga rubra*)	CDFG: Species of Special Concern	Requires cottonwood-willow riparian forests for nesting and foraging. Summer resident on the Colorado River.	No suitable habitat present in the Project area.	None	None
Vermilion flycatcher (*Pyrocephalus rubinus*)	CDFG: Species of Special Concern NECO Plan	Open farmlands, shrubby grasslands, streamsides, and small wooded ponds in desert habitat. Found in diverse areas near open water.	Limited suitable habitat within the proposed alternatives.	Low	Low
Yuma clapper rail (*Rallus longirostris yumanensis*)	ESA: Endangered CESA: Threatened CDFG: Fully Protected	Nests in freshwater marshes surrounded by tules and cattails. Found along the Colorado River.	No suitable habitat within the Project area.	None	None
Crissal thrasher (*Toxostoma crissale*)	CDFG: Species of Special Concern NECO Plan	Occurs in dense riparian and mesquite scrub, microphyll woodland, and riparian washes with a dense understory of shrubs	Some habitat present that could support species foraging but not typical for nesting. Riparian wash present south of the southern alternative. An unidentified thrasher was heard calling during the survey on the northern alternative.	Moderate	Moderate
Le Conte's thrasher (*Toxostoma lecontei*)	CDFG: Species of Special Concern USFWS: Bird of Conservation Concern NECO Plan	Arid and open plains that are sparsely vegetated and dominated by saltbush and creosote bush	This species was previously detected in 2011 in an area between the northern and southern alternatives. Suitable habitat for this species is present mainly in the creosote bush areas of the Project. An unidentified thrasher was heard calling during the survey on the northern alternative.	High	High

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Mammals					
Pallid bat (*Antrozous pallidus*)	CDFG: Species of Special Concern BLM: Sensitive NECO Plan	This gregarious species usually roosts in small colonies in rock crevices and buildings, but may nest in caves, mines, rock piles, and tree cavities.	Roosting habitat for pallid bats is present in tree cavities in desert riparian woodland wash in the southeastern portion of the survey area. The closest documented occurrence in the CNDDB is from 1992, approximately 30 miles to the southwest of the airport near Corn Springs.	Low	Low
Pallid San Diego pocket mouse (*Chaetodipus fallax pallidus*)	CDFG: Species of Special Concern	Along desert borders in eastern San Diego County in desert washes, desert scrub, desert succulent scrub, and pinyon-juniper areas. Usually in rocky or gravelly areas.	Very little habitat observed within the Project area. Closest CNDDB occurrence is from 1957 approximately 11 miles southwest.	Low	Low
Townsend's big-eared bat (*Corynorhinus townsendii*)	CDFG: Species of Special Concern BLM: Sensitive NECO Plan	Occurs in a wide variety of habitats but most commonly in mesic areas. Roosts in open areas.	Suitable foraging habitat within the Project area but limited roosting habitat. The closest CNDDB record is from 1919 and is approximately seven miles southeast of the surveyed areas.	Low	Low
Western yellow bat (*Lasiurus xanthinus*)	CDFG: Species of Special Concern	Occurs in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats. Roosts in trees and forages over water and in trees.	Limited roosting habitat available in the Project area; no water observed during surveys. The only CNDDB record is from 1980 and is mapped in Blythe.	Low	Low
California leaf-nosed bat (*Macrotus californicus*)	CDFG: Species of Special Concern BLM: Sensitive NECO Plan	Lowland desert scrub, desert riparian and wash areas, alkali scrub, or palm oases. Requires rugged or rocky terrain with mines or caves for roosting.	Suitable foraging habitat is present throughout the Project area, although roosting habitat is limited in the immediate region. A 2002 CNDDB record lists a colony of bats in the general vicinity (in the Roosevelt Mine quad), but specific location information is suppressed and it is unclear which species of bat may be present.	Low	Low
Arizona myotis (*Myotis occultus*)	CDFG: Species of Special Concern	Lowlands of the Colorado River and adjacent desert mountain ranges. Roosts in tree hollows, rock crevices, and similar areas.	The closest documented occurrence in the CNDDB is from 1942, approximately five miles south of the Project.	Low	Low

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Cave myotis (*Myotis velifer*)	CDFG: Species of Special Concern BLM: Sensitive NECO Plan	Low elevation arid regions near the Colorado River and in adjacent mountains. Requires caves or mines for roosting.	Suitable foraging habitat is present throughout the Project area, although roosting habitat is limited in the immediate region. A 2002 CNDDB record lists a colony of bats in the general vicinity (in the Roosevelt Mine quad), but specific location information is suppressed and it is unclear which species of bat may be present.	Low	Low
Yuma myotis (*Myotis yumanensis*)	BLM: Sensitive	Prefers open forests and woodlands. Requires water for foraging. Roosts in mines, caves, buildings, and crevices.	No roosting or foraging habitat available within the Project area.	None	None
Colorado Valley woodrat (*Neotoma albigula venusta*)	NECO Plan	Low-lying deserts in southeastern California, particularly those with beavertail cactus (*Opuntia basilaris*) and mesquite (*Prosopis* sp.).	While there is ample foraging habitat for this species, there is very little rocky habitat for constructing middens into. There were no obvious signs of woodrat at the burrows that were observed.	Low	Low
Pocketed free-tailed bat (*Nyctinomops femorosaccus*)	CDFG: Species of Special Concern NECO Plan	Occurs in rocky areas with high cliffs in pine-juniper woodland, desert scrub, palm oasis, desert wash, and desert riparian habitat.	No suitable habitat in Project area.	None	None
Nelson's bighorn sheep (*Ovis canadensis nelson*)	BLM: Sensitive NECO Plan	Mountain slopes with sparse growth of trees above the desert floor in California.	Nelson's bighorn sheep is known within the region. While the species is generally associated with mountainous areas, desert floor areas are important for dispersal and seasonal movement.	Low	Low
Colorado River cotton rat (*Sigmodon arizonae plenus*)	CDFG: Species of Special Concern	Occurs in alluvial areas along the Colorado River in areas supporting marshy vegetation.	No suitable habitat in Project area.	None	None
American badger (*Taxidea taxus*)	CDFG: Species of Special Concern	Coastal sage scrub, mixed chaparral, grassland, oak woodland, chamise chaparral, mixed conifer, pinyon-juniper, desert scrub, desert wash, montane meadow, open areas, and sandy soils.	Suitable badger habitat occurs throughout the vicinity in undeveloped areas. Some large burrows were observed within the Project area but were likely kit fox and/or coyote.	High	High
Desert kit fox (*Vulpes macrotis arsipus*)	Calif. Code of Regulations: PFM	Suitable habitat for this fossorial mammal consists of arid open areas, shrub grassland, and desert ecosystems.	Suitable kit fox habitat occurs throughout the vicinity in undeveloped areas. A kit fox den was detected on the southern alternative.	High	Present

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Northern Transmission Line (BLM Jurisdiction)[2]	Potential for Occurrence within the Southern Transmission Line (BLM Jurisdiction)[2]
Fish					
Razorback sucker (*Xyrauchen texanus*)	ESA: Endangered CESA: Endangered CDFG: Fully Protected	Colorado River. Uses both quiet and swift waters and spawns in shallow water where there is abundant sand, gravel, and rocks.	There is no suitable habitat to support this species within the Project area.	None	None

1.0 INTRODUCTION

Power Engineers, Inc. (POWER) conducted a western burrowing owl (*Athene cunicularia hypugaea*) protocol-level survey for the Renewable Resources Group, LLC (RRG) as part of the proposed Blythe Mesa I Solar Project (BMSP, Project). The primary purpose of the surveys was to determine the presence or absence of burrowing owls within the defined study area. The study area is located within Riverside County, California near the community of Blythe; on approximately 3,679 acres in the Palo Verde Mesa (Figure 1). The study area for the purposes of this document is delineated on Figure 2 and includes a 125-foot proposed right-of-way along the transmission line.

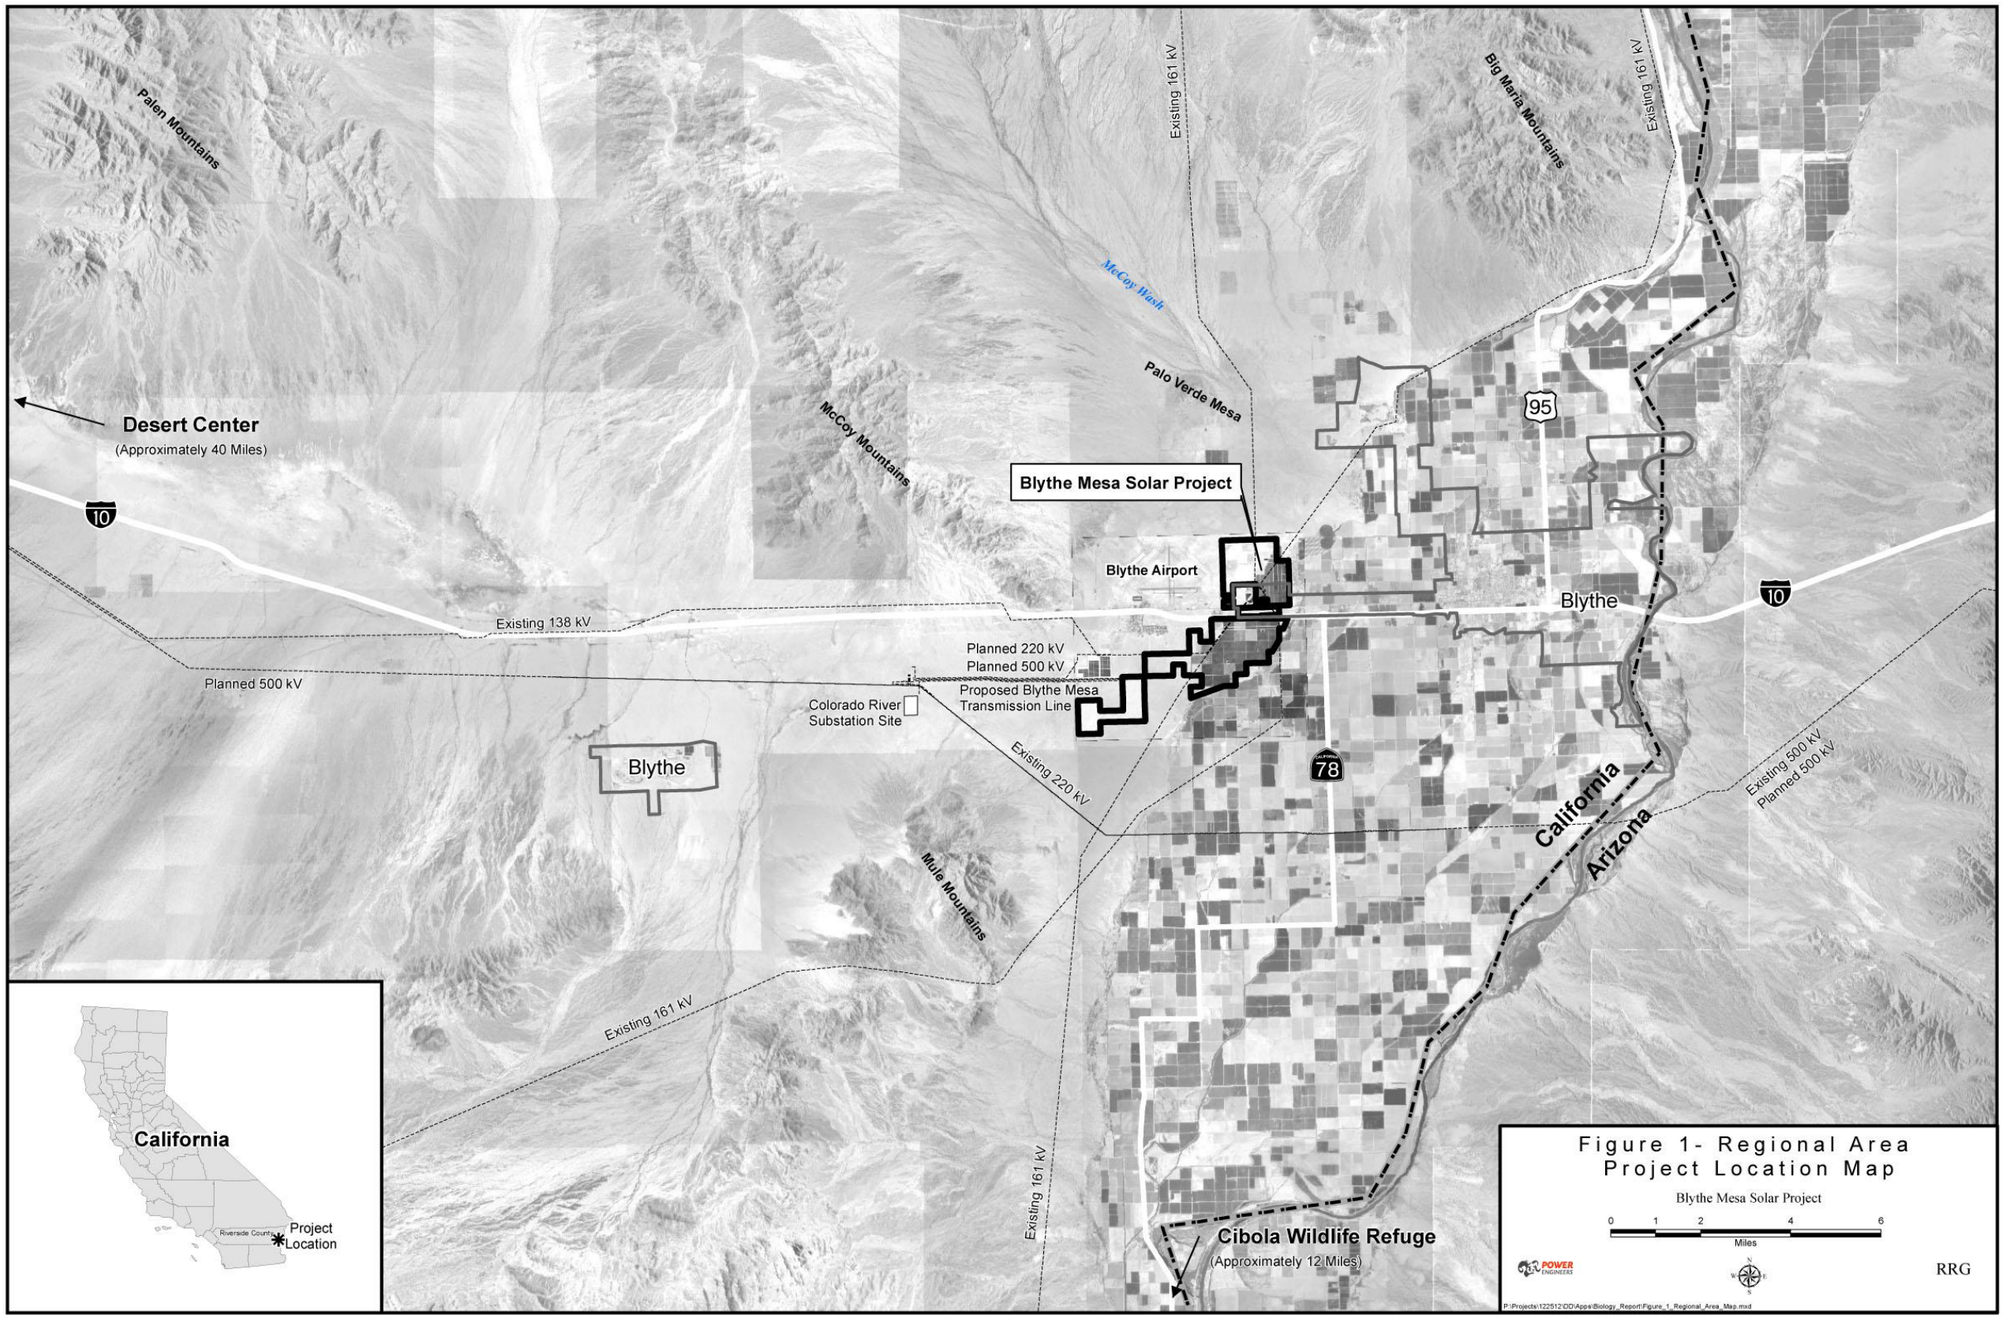
1.1 PROJECT OVERVIEW

The proposed Project consists of construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure to provide site access and connection to the statewide electricity transmission grid. The Project footprint is proposed to be located on approximately 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587 for the solar field and 73 acres for the 230 kilovolt (kV) transmission line interconnect. POWER conducted the surveys within proposed Project transmission line footprint which included a 500 feet wide corridor centered on the 125-foot wide project right-of-way. The survey area of array parcels included a 500-foot (150-meter) wide buffer around the project limits. The proposed project would occupy a total of 3,660 acres and consist of the following components:

- Solar array field utilizing single axis solar PV trackers
- System of interior collection power lines located between inverters and substations
- Three on-site substations (approximately 300 feet long by 300 feet wide)
- Two operation and maintenance (O&M) buildings (approximately 3,500 square feet each)
- Two primary off-site access roads and several interior access roads
- 4.8 miles of 230 kV double-circuit transmission line between the solar field and Colorado River Substation

1.2 REGIONAL SETTING

The 3,660-acre site is five miles west of Blythe and consists mostly of agricultural land, including lemon orchards. The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5' U.S. Geological Survey (USGS) Topographic Quadrangles (see Figure 1). The Project is located on:



- Sections 11 and 12 of Township 7 South, Range 21East
- Sections 3, 4, 5, 6, 8, 9 of Township 7S, South, Range 22 East
- Sections 27, 28, 29, 32, 33, 34 of Township 6 South, Range 22 East, of the San Bernardino Base Meridian

State Highway 10 bisects the Project area, which is bounded on the north and south by undeveloped open desert, on the east by agricultural lands and on the west by the Blythe City Airport and open desert lands.

The Project area is located on the western mesa of the Palo Verde Valley. The topography is relatively flat and slopes toward the southeast; elevations range from 260 to 400 feet above mean sea level (AMSL). The subtropical climate of the Colorado Desert is currently characterized by dry, mild winters averaging 45 degrees Fahrenheit (˚F) and dry, hot summers that average 104˚F. Summer highs are known to reach up to 120˚F. Precipitation ranges between two and ten inches per year, with most of the precipitation occurring between November and March. Although rainfall occurs primarily in the winter months, the region is periodically influenced by tropical weather conditions, including sudden monsoonal summer storms which typically occur from July to later September.

THIS PAGE INTENTIONALLY LEFT BLANK

FIGURE 1 - REGIONAL AREA PROJECT LOCATION MAP

THIS PAGE INTENTIONALLY LEFT BLANK

1.3 EXISTING CONDITIONS

The proposed project consists primarily of desert scrub and agricultural lands. Along the four mile transmission line route and eastern and southern ends of the project limits there are discrete areas of disturbed native creosote scrub and disturbed stabilized dune and blow sand habitats. Table 1 presents the estimated acreage observed for each habitat type within the study area. This data does not represent the actual proposed project disturbance footprint for the solar areas, transmission lines, substations, and facility buildings and roads.

TABLE 1. OBSERVED HABITAT ACREAGE WITHIN THE STUDY AREA

Habitat	Acres	Percentage Within the Project Site
Bajada	18.07	0.5%
Creosote Scrub	46.74	1.3%
Desert Riparian Woodland Wash	2.83	0.1%
Disturbed	31.15	0.8%
Disturbed Creosote Scrub	233.44	6.3%
Disturbed Creosote Scrub and Fallow Agricultural	271.10	7.4%
Dune, Blowsand Desert Pavement	52.52	1.4%
Fallow	249.72	6.8%
Irrigated Cropland	404.02	11.0%
Irrigation Pond	17.21	0.5%
Mixed	75.92	2.1%
Non-Irrigated Cropland	1088.15	29.6%
Orchard	1188.36	32.3%
Total Project Area Acreage (Includes 125 ft right-of-way)	**3679.24**	**100.0%**

As listed above, the Project area comprises mainly agricultural land and desert scrub. Existing land consists of farmland, fallow farmland, creosote bush scrub, or stabilized desert dune and blowsand habitat. Active agricultural uses include citrus orchard and ornamental date palms, and wheat and alfalfa fields. Jojoba was previously grown for commercial purposes in some portions of the project area. The jojoba fields have been abandoned at some point in the recent past and are currently a mix of jojoba and reestablishing creosote bush scrub.

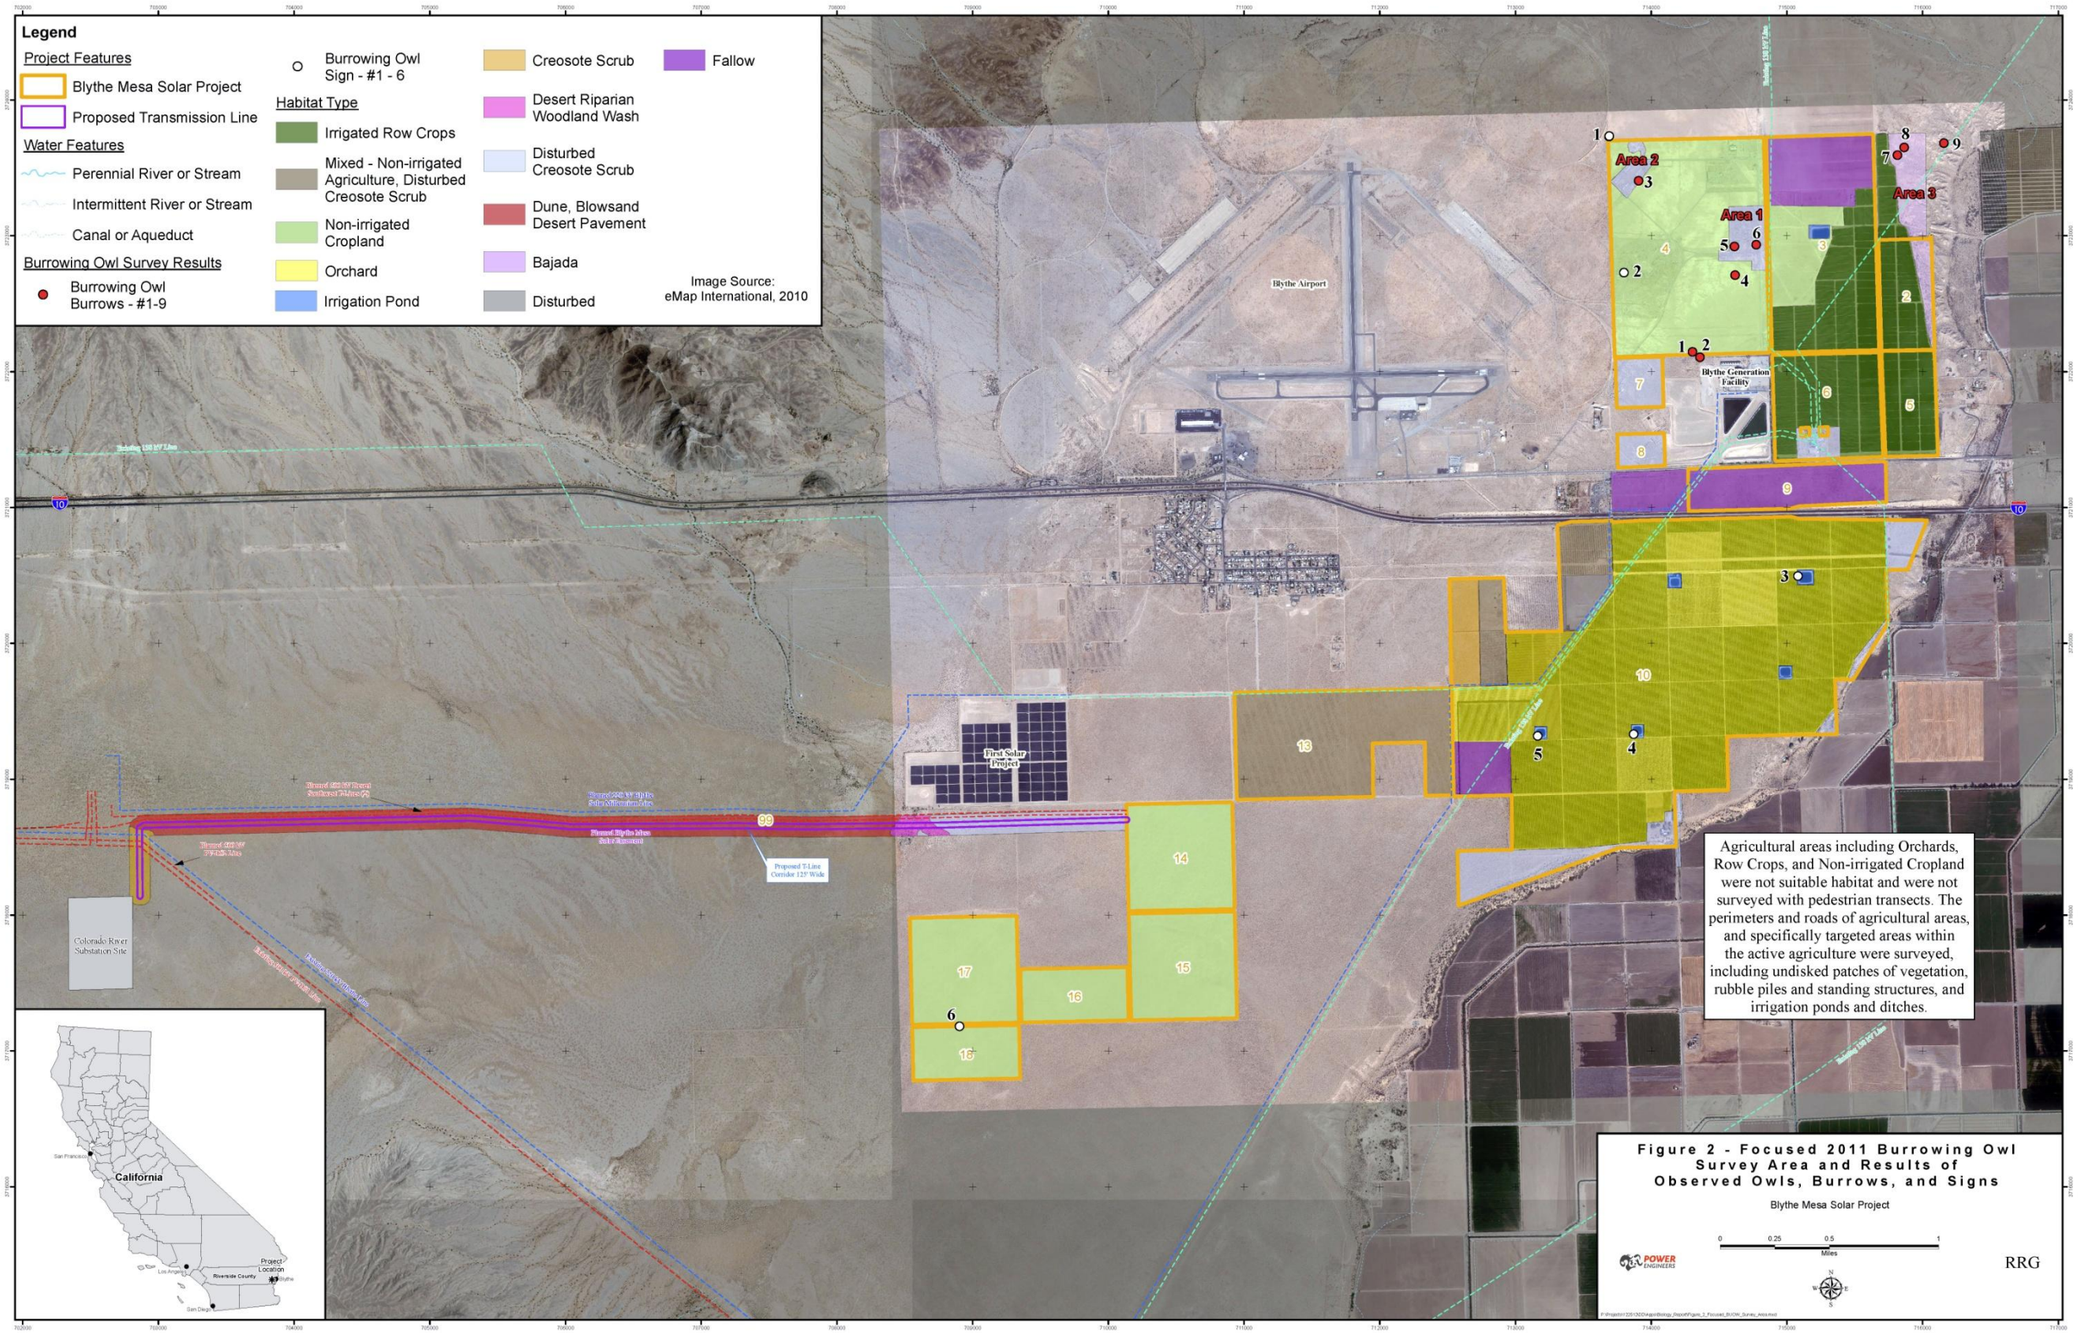
The study area is also situated among energy generating facilities (i.e., solar and natural gas-fired), active transmission lines, and electrical substations. Given the extent of the existing human-influenced environment (e.g., active agricultural operations [harvesting, discing, and planting]; high levels of automobile traffic [Interstate 10 bisects the Project]; energy generation, distribution and maintenance facilities; and ongoing aviation related activities) within the study area, any animals currently using these lands are assumed to be acclimated to the disturbance regime present.

2.0 SPECIES DESCRIPTION

Western burrowing owl is designated as a Priority 2 Bird Species of Special Concern by the California Department of Fish and Game (CDFG) due to rapid habitat loss and degradation from urbanization. It is also designated as a U.S. Department of the Interior, Bureau of Land Management (BLM) Sensitive species and a U.S. Fish and Wildlife Service (USFWS) Bird of Conservation Concern. Its range extends through all states west of the Mississippi Valley and into Mexico, Central America, and South America.

In California, it typically inhabits lowlands, including those in the Central Valley, northeastern plateau, southeastern deserts, and coastal areas. For shelters, the burrowing owl uses rodent burrows in sparse grassland, desert, and agricultural habitats, as well as open areas of pinyon-juniper or ponderosa pine habitats (CDFG 2008). Breeding populations generally display greater site fidelity than winter populations, which tend to move about more, even taking refuge into vegetation instead of nearby burrows (Poulin et al. 2011). Individuals in California, particularly Southern California, are mostly residents (CDFG 2008). Nesting begins from late March to August, peaking in April and May (CDFG 2008). While some pairs have been observed to have double broods within a single breeding season, it is considered to be uncommon and is not always successful (Poulin et al. 2011). Burrowing owls are typically active at dusk and dawn, but can sometimes be active at night, as well.

3.0 SURVEY METHODOLOGY



Collection of burrowing owl baseline data in the Project area included a review of the California Natural Diversity Database (CNDDB) records and of applicable biological documents, including several solar projects that have completed burrowing owl surveys. Additionally, a systematic pedestrian assessment of the study area to determine the habitat suitability for burrowing owls was conducted on the 5th and 6th of May 2011.

Protocol surveys were started on May 6 and extended through July 23, 2011. Survey methods were derived from generally accepted professional standards, the 1993 California Burrowing Owl Consortium (CBOC) Burrowing Owl Survey Protocol and Mitigation Guidelines (CBOC 1993), and the 1995 CDFG Staff Report on Burrowing Owl Mitigation (CDFG 1995). In summary, a methodical pedestrian survey for owl burrows was conducted by walking through areas of suitable habitat within the study area, including man-made structures. In addition, biologists visited the Cibola National Wildlife Refuge (CNWR) 12 miles to the south of the Project limits to view the known burrowing owls there as a reference population; biologists saw six burrowing owls foraging near an agricultural field at the CNWR, which confirmed activity in middle to late July in this region of the owls' range.

POWER biologists Tom Herzog, Steve Hicks, Ken McDonald, and Melissa Lippincott, and Garcia and Associates, Inc. biologists Andrew McCadden, Angelique Herman, and Laura Megill conducted pedestrian survey transects, spaced at approximately 100 feet to allow for 100% visual coverage of the study area. Where necessary, transect spacing was reduced or expanded to account for differences in terrain, vegetation density, and visibility. The locations of all potential owl burrows and sign were recorded and mapped using handheld global positioning devices and aerial imagery. Figure 2 presents the protocol burrowing owl survey areas for the Project area.. Incidental observations of other avian species, plants and other wildlife were also noted. The presence of each observed wildlife species was based on direct observation of individual(s), sign, and/or vocalization.

Field surveys were conducted when weather conditions were conducive to observing owls and other avian species. The surveys were not performed during rain, high winds (greater than 20 mph), dense fog, or temperatures over 90 ºF. Observations were made from the nearest appropriate vantage points with the use of binoculars when access to discrete portions of the study area were not possible due to private property, topographic relief, physical barriers, health and safety considerations, etc.

FIGURE 2 – FOCUSED BURROWING OWL SURVEY AREA, OBSERVED OWLS, BURROWS AND SIGN

THIS PAGE INTENTIONALLY LEFT BLANK

4.0 SURVEY RESULTS

A nine-quad search of the CNDDB (CNDDB, 2011a) including USGS quadrangles McCoy Peak, McCoy Wash, Blythe NE, Roosevelt Mine, Ripley, Blythe, Thumb Peak, Palo Verde, and Mule Wash identified 46 occurrences of burrowing owls in the Blythe area, with two occurrences on the Project site. In addition to the CNDDB records search, recent surveys and reports for similar projects near the Project area were also reviewed (Table 2).

TABLE 2. ADJACENT PROJECT SURVEY INFORMATION

Species	Project	Species Detected	BMSP Survey Area Overlap
Burrowing Owl	Blythe Solar Power Project	Yes, two within solar site, four in transmission line and multiple sign. Not determined how sign was confirmed.	Overlaps with BMSP transmission line and Colorado River Substation (CRS) survey areas.
	Genesis Solar Energy Project	Yes, three individuals detected around the generation tie line and one burrow around the main site.	No overlap
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Burrow sites detected along project segment that encompasses Colorado River Substation, but specific locations not mapped.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, burrowing owls detected along southern telecom route. Three owls detected just east of Colorado River Substation.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.

4.1 FIELD RESULTS

During the habitat assessment survey, biologists determined that the Project area contained suitable habitat conditions to support burrowing owls. Of the 3,679 acres in the study area, approximately 1,970 acres (54%) of suitable burrowing owl habitat were identified (Figure 2). Suitable habitat consisted of both fallow and active agricultural fields, irrigation ponds and canals, and creosote bush scrub. Suitable habitat also occurred along the edges of orchards. The remaining 1,703 acres consisted of orchards and alfalfa fields. Orchards within the project area did not contain suitable habitat; burrowing owls prefer open areas and do not inhabit areas with dense vegetation (U.S. Fish and Wildlife Service, 2003). Alfalfa fields provide suitable forage areas for burrowing owls, but heavy and frequent disturbance of the fields by disking and harvesting decreases burrow availability. Burrows can occur along the edges of agricultural fields, orchards and road banks; all road banks, field edges and irrigation ditches along the agricultural areas throughout the Project site were surveyed. Six irrigation ponds located in the orchard area and irrigation channels throughout the agricultural area and to the east of the project limits provide accessible fresh water for wildlife.

The field data from the protocol surveys identified the presence of six burrowing owls during the May survey and eight owls during the July surveys, and an additional two owls were observed outside the project site but within the survey buffer. Nine suitable burrows or burrow complexes were observed in the northern portion of the site (Figure 2). No suitable burrows were observed in the southern portion of the site. Soil conditions in the southern half of the site within Project Parcels 4, 13-18 and the transmission corridor were very sandy and unstable. However, burrowing owl sign (white wash, pellets, feathers) was observed in five locations in the southern region of the Project area. Burrows observed in the southern half of the site belonged to either kit fox (*Vulpes macrotis*) or kangaroo rat (*Dipodomys* sp.). No burrowing owl sign was observed near the kit fox burrows. Several of the kit fox burrows were recent and active kit fox sign was documented; however, most of the burrows were old and collapsed and would not support burrowing owl because the instability of the soil.

During the July surveys (14-19 and 21-23) burrowing owl activity and use was determined to the extent possible. Burrows were monitored at sunrise or sunset on different days to ensure a complete activity period was evaluated for each observed bird. The northern end of the Project site was divided into three burrowing owl monitoring sites. Please refer to Figure 2 for the location of Areas 1, 2, and 3.

Area 1 supported four burrowing owls. The four burrowing owls were observed flying in and out of three separate concrete / brick lined cylindrical, man-made structures, which have concrete collars above ground level and are open to below ground level to a depth of approximately four feet. Appendix C includes site photographs and images of the well location burrows and these described elements. In Area 1, Burrow #4 contained the greatest number of observed sign, including pellets, prey detritus, feathers, and white wash. Burrows # 5 and 6 also featured significant amounts of pellets, detritus, white wash, and feathers. Biologists were unable to determine if the owls were two separate pairs or one pair with two juveniles. Burrowing owls at Area 1 consistently exhibited social and foraging behavior. Several perch sites were favored in this area, including a metal rod with a rounded top, a fence post, a large pile of cleared vegetation and, most frequently, the edges of the concrete wells. Area 1 consisted of approximately five acres of disturbed creosote bush scrub dominated by creosote bush and bur sage; concrete rubble piles from old demolished barracks were scattered throughout the creosote bush scrub. Area 1 was bound on the south, west and north by recently tilled, non-irrigated wheat fields that have been farmed for approximately one year. This field is bound to the north by open space comprising creosote scrub habitat, and to the west by disturbed creosote scrub habitat within the area of the former military base and current Blythe Airport.

In Area 2, two burrowing owls occupied a single burrow located in a concrete rubble pile. The two owls were observed consistently during morning and evening hours perched on top of the rubble pile. Burrowing owl tracks were identified around and into the rubble pile, with feathers and pellets near a small burrow entrance beneath the rubble. Sex and age of the two burrowing owls observed during the surveys was not established. The burrowing owls occupying Area 2 were easily distressed and would flush and call to one another whenever biologists entered the vicinity. Area 2 consisted of approximately two acres of disturbed creosote bush scrub dominated by creosote bush and bur sage. Concrete rubble piles and two concrete foundations were scattered throughout the creosote bush scrub. Area 2 was surrounded to the south, east and north by recently tilled, non-irrigated wheat fields and disturbed creosote bush scrub to the west.

In Area 3, two burrowing owls occupied a burrow complex within a native Bajada area in the buffer study area. One burrow appeared to be a former canid burrow due to its size, shape, and location in an area of naturally formed earth mounds. Biologists identified three separate burrowing complexes on the earth mounds within an approximately ten-acre zone. Each burrow complex contained several burrows with recent sign, including white wash, feathers, tracks, and pellets. The two burrowing owls were typically

perched on top of earthen mounds when the biologists accessed the area. Biologists could not determine if the pair was nesting without additional harassment.

4.2 WILDLIFE AND PLANTS OBSERVED DURING BURROWING OWL SURVEY

Round-tailed ground squirrel (*Spermophilus tereticaudus*) and white-tailed antelope squirrel (*Ammospermophilus leucurus*) burrows where observed throughout the northern and eastern portions of the site along road sides, agricultural fields and disturbed areas with mounded soils or dump sites. Creosote bush (*Larrea tridentata*) was the dominant species in undisturbed portions of the site. Additional plants and wildlife species frequently observed within suitable habitat included bur sage (*Ambrosia dumosa*), wheat (*Triticum* sp.), mourning dove (*Zenaida macroura*), white-wing dove (*Zenaida asiatica*), horned lark (*Eremophila alpestris*), greater roadrunner (*Geococcyx californianus*), black-tailed jackrabbit (*Lepus californicus*), desert iguana (*Dipsosaurus dorsalis*), and western whiptail (*Cnemidophorus tigris*). Three CDFG Species of Special Concern, Le Conte's thrasher (*Toxostoma lecontei*), loggerhead shrike (*Lanius ludovicianus*) and Mohave fringe-toed lizard (*Uma scoparia*) were observed in multiple locations on both the northern and southern portions of the Project area. Complete plant and wildlife species observed are included in Appendices A and B.

5.0 CONCLUSION

The study area supports a relatively small population of burrowing owl, and based on the burrowing owl survey results from surrounding solar projects burrowing owl may occupy habitat outside of the study area limits (AECOM 2010, Aspen 2011). It was not determined if this population is increasing or decreasing in size or the length of occupancy. The surveys determined that in July 2011, eight individual burrowing owls were present within the study area and may be directly or indirectly affected by the Project. This determination is valid for 12 months from the completion of this report (October 2011 through October 2012). The number of owls or burrows affected at the time of ground disturbance may be greater than or less than this number because of the natural variation in the owl population in this region, and natural and man-made conditions that may occur prior to construction.

APPENDIX A – OBSERVED PLANT LIST

Plant Species Observed During Surveys

Scientific Name	Common Name
ANGIOSPERMS (DICOTYLEDONS)	
AMARANTHACEAE	**AMARANTH FAMILY**
Tidestromia oblongifolia	honeysweet
APIACEAE	**CARROT FAMILY**
Lomatium sp.	lomatium
ASCLEPIADACEAE	**MILKWEED FAMILY**
Asclepias sp.	milkweed
Asclepias subulata	rush milkweed
Sarcostemma cynanchoides ssp. hartwegii	climbing milkweed
ASTERACEAE	**SUNFLOWER FAMILY**
Ambrosia dumosa	burro bush
Baileya pauciradiata	Colorado Desert marigold
Bebbia juncea	sweetbush
Chaenactis sp.	pincushion
Chaenactis stevioides	desert pinchushion
Dicoria canescens	bugseed
Geraea canescens	desert sunflower
Hymenoclea salsola	cheesebush
Palafoxia arida	Spanish needles
Pluchea sericea	arrow weed
Stephanomeria pauciflora	wire lettuce
BORAGINACEAE	**BORAGE FAMILY**
Cryptantha sp.	cryptantha
Cryptantha angustifolium	narrowleaf cryptantha
Cryptantha costata	ribbed cryptantha
Cryptantha maritime	Guadalupe cryptantha
Cryptantha nevadensis	cryptantha
Cryptantha pterocarya	wing nut cryptantha
Nama demissum	purple desert mat
Pectocarya sp.	pectocarya
Tiquilia palmeri	Palmer's tiquilia
Tiquilia plicata	plicate tiquilia
BRASSICACEAE	**MUSTARD FAMILY**
*Brassica tournefortii**	Sahara mustard
*Buxus microphylla**	Japanese box
Lepidium sp.	peppergrass
Lepidium lasiocarpum	peppergrass
Simmondsia chinensis	jojoba
CASUARINACEAE	**SHE OAK FAMILY**
Casuarina sp.*	she oak
CACTACEAE	**CACTUS FAMILY**
Cylindropuntia echinocarpa	golden cholla
Mammillaria sp.	fish-hook cactus
CHENOPODIACEAE	**GOOSEFOOT FAMILY**
Atriplex canescens	four-wing saltbush
Atriplex lentiformis	quail brush

Scientific Name	Common Name
*Bassia hyssopifolia**	five-hooked bassia
Salsola tragus	Russian thistle
CUCURBITACEAE	**GOURD FAMILY**
Cucurbita sp.*	squash
EUPHORBIACEAE	**SPURGE FAMILY**
Stillingia spinulosa	annual stillingia
FABACEAE	**LEGUME FAMILY**
Acacia greggii	cat claw acacia
Astragalus sp.	astragalus
Cercidium floridum	palo verde
Dallea mollissima	downy dalea
*Medicago sativa**	alfalfa
Olneya tesota	desert ironwood
Prosopis sp.	mesquite
Prosopis glandulosa	Honey mesquite
Psorothamnus emoryi	indigobush
Psorothamnus schottii	indigobush
GERANIACEAE	**GERANIUM FAMILY**
*Erodium cicutarium**	red-stemmed filaree
LOASACEAE	**LOASA FAMILY**
Eucnide urens	rock nettle
Mentzelia sp.	blazing star
Mentzelia multiflora	blazing star
Petalonyx thurberi ssp. thurberi	sandpaper plant
MARTYNIACEAE	**UNICORN PLANT FAMILY**
Proboscidea althaeifolia	desert unicorn plant
MYRTACEAE	**MYRTLE FAMILY**
Eucalyptus sp.*	gum tree
NYCTAGINACEAE	**FOUR O'CLOCK FAMILY**
Abronia villosa	sand verbena
ONAGRACEAE	**EVENING PRIMROSE FAMILY**
Camissonia boothii	bottlebrush primrose
Oenothera deltoids ssp. deltoides	bird-cage primrose
PLANTAGINACEAE	**PLANTAIN FAMILY**
Plantago erecta	western plantain
Plantago ovata	wooly plantain
POLEMONIACEAE	**PHLOX FAMILY**
Eriastrum harwoodii	Harwood's eriastrum
Gilia sp.	
Langloisia setosissima	lilac sunbonnet
POLYGONACEAE	**BUCKWHEAT FAMILY**
Chorizanthe brevicornu	brittle spineflower
Chorizanthe rigida	rigid spineflower
Eriogonum sp.	
RESDACEAE	**MIGNONETTE FAMILY**
Oligomeris linifolia	Narrow-leaf oligomeris
ROSACEAE	**ROSE FAMILY**

Scientific Name	Common Name
*Prunus persica**	peach
RUTACEAE	**RUE FAMILY**
*Citrus limon**	lemon
*Citrus sinensis**	orange
TAMARICACEAE	**TAMARISK FAMILY**
*Tamarix ramosissima**	Mediterranean tamarisk
VISCACEAE	**MISTLETOE FAMILY**
Phoradendron californicum	desert mistletoe
ZYGOPHYLLACEAE	**CALTROP FAMILY**
Larrea tridentata	creosote bush
ANGIOSPERMS (MONOCOTYLEDONS)	
ARECACEAE	**PALM FAMILY**
Phoenix sp.*	date palm
LILIACEAE	**LILY FAMILY**
Hesperocaulis undulata	desert lily
POACEAE	**GRASS FAMILY**
Pleuraphis rigida	galleta grass
*Schismus barbatus**	Mediterranean schismus
*Triticum aestivum**	wheat

* = non-native species

APPENDIX B – OBSERVED WILDLIFE LIST

Scientific Name	Common Name
CLASS INSECTA	**INSECTS**
MELOIDAE	**BLISTER BEETLES**
Lytta auriculata	red-eared blister beetle
TENEBRIONIDAE	**DARKLING BEETLES**
Asbolus verrucosus	desert ironclad beetle
Eleodes spinipes	darkling beetle
MANTIDAE	**MANTIDS**
Litaneutria minor	ground mantis
PIERIDAE	**WHITE & SULPHUR BUTTERFLIES**
Pieris rapae	cabbage white
Pontia protodice	checker-white
NYMPHALIDAE	**BRUSH-FOOTED BUTTERFLIES**
Vanessa virginiensis	Virginia lady
LYCAENIDAE	**GOSSAMER WING BUTTERFLIES**
Brephidium exilis	pygmy blue
FORMICIDAE	**ANTS**
Messor pergandei	desert harvester ant
MUTILLIDAE	**VELVET ANTS**
Dasymutilla sp.	velvet ant
POMPILIDAE	**SPIDER WASPS**
Pepsis formosa	tarantula wasp
CLASS AMPHIBIA	**AMPHIBIANS**
Bufo woodhousii	Woodhouse's toad
CLASS REPTILIA	**REPTILES**
TRIONYCHIDAE	**SOFTSHELL TURTLES**
Apalone spinifera	spiny softshell turtle
IGUANIDAE	**IGUANID LIZARDS**
Callisaurus draconoides draconoides	common zebra-tailed lizard
Dipsosaurus dorsalis	desert iguana
Phrynosoma sp.	horned lizard
Uma scoparia	Mojave fringe-toed lizard
Uta stansburiana	common side-blotched lizard
TEIIDAE	**WHIPTAIL LIZARDS**
Cnemidophorus sp.	whiptail
COLUBRIDAE	**COLUBRID SNAKES**
Arizona elegans occidentalis	Glossy snake
Chinoactis occipitalis	shovel-nosed snake
VIPERIDAE	**VIPERS**
Crotalus cerastes	sidewinder

Scientific Name	Common Name
CLASS AVES	**BIRDS**
CATHARTIDAE	**NEW WORLD VULTURES**
Cathartes aura	turkey vulture
ACCIPITRIDAE	**HAWKS, KITES, EAGLES**
Buteo jamaicensis	red-tailed hawk
FALCONIDAE	**FALCONS**
Falco sparverius	American kestrel
ODONTOPHORIDAE	**NEW WORLD QUAIL**
Callipepla gambelii	Gambel's quail
CHARADRIIDAE	**PLOVERS**
Charadrius vociferus	killdeer
COLUMBIDAE	**PIGEONS & DOVES**
Columba livia	rock pigeon
Streptopelia risoria	ringed turtle-dove
Zenaida aurita	white-winged dove
Zenaida macroura	mourning dove
CUCULIDAE	**CUCKOOS & ROADRUNNERS**
Geococcyx californianus	greater roadrunner
STRIGIDAE	**TRUE OWLS**
Athene cunicularia	burrowing owl
APODIDAE	**SWIFTS**
Aeronautes saxatalis	white-throated swift
TYRANNIDAE	**TYRANT FLYCATCHERS**
Tyrannus verticalis	western kingbird
ALAUDIDAE	**LARKS**
Eremophila alpestris	horned lark
HIRUNDINIDAE	**SWALLOWS**
Petrochelidon pyrrhonota	cliff swallow
CORVIDAE	**JAYS & CROWS**
Corvus corax	common raven
LANIIDAE	**SHRIKES**
Lanius ludovicianus	loggerhead shrike
STURNIDAE	**STARLINGS**
Sturnus vulgaris	European starling
ICTERIDAE	**BLACKBIRDS**
Agelaius phoeniceus	red-winged blackbird
Euphagus cyanocephalus	Brewer's blackbird
Icterus cucullatus	hooded oriole
Xanthocephalus xanthocephalus	yellow-headed blackbird
Quiscalus mexicanus	great-tailed grackle

Scientific Name	Common Name
MIMIDAE	**MOCKINGBIRDS & THRASHERS**
Toxostoma lecontei	Le Conte's thrasher
THRAUPIDAE	**TANAGERS**
Piranga ludoviciana	Western tanager
SYLVIIDAE	**GNATCATHERS**
Polioptila caerulea	black-tailed gnatcatcher
EMBERIZIDAE	**EMBERIZIDS**
Zonotrichia leucophrys	white-crowned sparrow
FRINGILLIDAE	**FINCHES**
Carduelis tristis	American goldfinch
CLASS MAMMALIA	**MAMMALS**
LEPORIDAE	**HARES & RABBITS**
Lepus californicus	black-tailed jackrabbit
Sylvilagus audubonii	desert cottontail
SCIURIDAE	**SQUIRRELS**
Ammospermophilus leucurus	white-tailed antelope squirrel
Spermophilus tereticaudus	Round-tailed ground squirrel
HETEROMYIDAE	**POCKET MICE & KANGAROO RATS**
Dipodomys sp.	kangaroo rat
CANIDAE	**WOLVES & FOXES**
Canis familiaris	domestic dog
Canis latrans	coyote
Vulpes macrotis	kit fox
MUSTELIDAE	**WEASELS, SKUNKS & OTTERS**
Taxidea taxus	American badger
BOVIDAE	**BISON, GOATS & SHEEP**
Ovis canadensis	bighorn sheep (skull)
CHIROPTERA	**BATS**
Myotis sp.	Myotis

1.0 INTRODUCTION

This Avian and Bat Protection Plan (ABPP) has been designed to protect resident and migrating avian and bat species that may be at risk from construction, operation and maintenance (O&M) of the proposed Blythe Mesa Solar Project (BMSP, Project). At the request of the Proponents, Renewable Resources Group, Inc. and Solar Star Blythe Mesa 1, LLC, this ABPP was prepared by POWER Engineers, Inc. as part of the proposed BMSP.

This ABPP has been written with consideration to and guidance from the data and suggestions presented in the U.S. Fish and Wildlife Service's (USFWS) *Region 8 Interim Guidelines for the Development of a Project-specific Avian and Bat Protection Plan for Solar Energy Plants and Related Transmission Facilities* (USFWS 2010), and the Avian Power Line Action Committee's (APLIC) *Mitigating Bird Collisions with Power Lines: The State of the Art in 1994* (APLIC 1994), *Avian Protection Plan Guidelines* (APLIC 2005), and *Suggested Practices for Avian Protection on Power Lines: The State of the Art in 2006* (APLIC 2006). In addition, existing information on bird and bat use in the Project area has been utilized to effectively address avian and bat safety specific to the construction and operation and maintenance (O&M) work of BMSP to reduce impacts to migratory birds, bald and golden eagles, listed bat and avian species.

The Project is commitment to avian and bat safety and compliance with the Migratory Bird Treaty Act of 1918 (MBTA, 16 U.S.C. 703 – 712), the Bald and Golden Eagle Protection Act of 1940 (BGEPA, 16 U.S.C. 668 – 668d), and the Endangered Species Act of 1973, as amended (ESA, 16 U.S.C. 1531 – 1544). The following plan will outline the methods, and requirements to ensure that birds and bat are protected during the construction and O&M work of the proposed BMSP.

1.1 Project Description

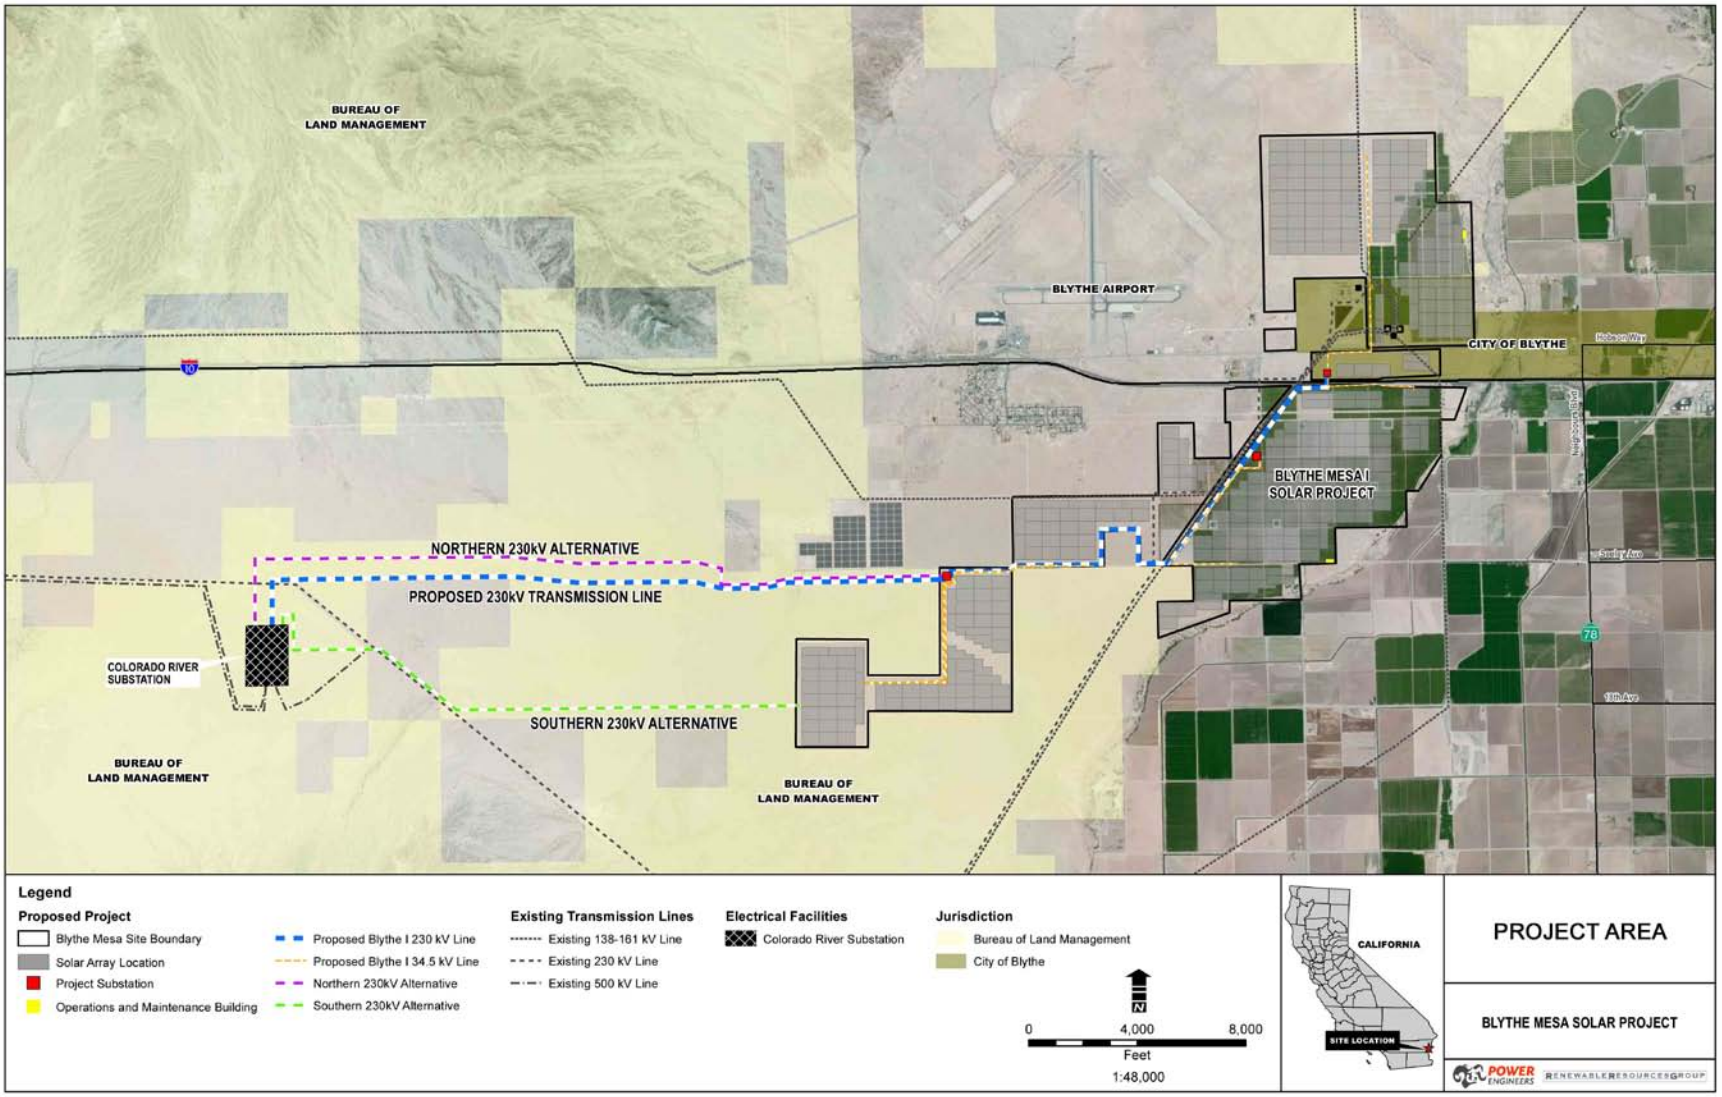
The proposed Project consists of construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure to provide site access and connection to the statewide electricity transmission grid via interconnection to the Southern California Edison (SCE) Colorado River Substation, an approved new substation located south of Interstate 10 (I-10) and approximately four miles west of the Project site. The Project is proposed to be located on approximately 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587 for the solar facility and 73 acres for the 230 kilovolt (kV) transmission line interconnect. The proposed Project would consist of the following components (Figure 1):

- Solar Facility site (3,587 total acres)
    - Solar array field would utilize single-axis solar PV trackers (295 feet long and 140 feet wide). Six trackers with 18 north-south oriented rows of PV panels would be configured into 1.5 MW blocks (600 feet long by 470 feet wide).
    - System of interior collection power lines located between inverters and substations
    - Three on-site substations (each approximately 300 feet long by 300 feet wide)
    - Two operation and maintenance (O&M) buildings (approximately 3,500 square feet each)
    - Two primary off-site access roads and several interior access roads
- Approximately 8.4 miles of 230 kV double-circuit transmission line
    - Approximately 3.6 miles would be located within the solar facility
    - Approximately 4.8 miles would extend outside of the solar facility and would be placed within a 125-foot-wide right-of-way (ROW) and occupy 73 acres.

1.1.1 Regional Setting

The 3,660-acre site is five miles west of Blythe and consists mostly of agricultural land, including lemon orchards. The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5' U.S. Geological Survey (USGS) Topographic Quadrangles (see Figure 2). The Project is located on:

- Sections 11 and 12 of Township 7 South, Range 21 East
- Sections 3, 4, 5, 6, 8, 9 of Township 7S, South, Range 22 East
- Sections 27, 28, 29, 32, 33, 34 of Township 6 South, Range 22 East, of the San Bernardino Base Meridian



State Highway 10 bisects the Project area, which is bounded on the north and south by undeveloped open desert, on the east by agricultural lands, and on the west by the Blythe City Airport and open desert lands.

The Project area is located on the western mesa of the Palo Verde Valley. The valley is a portion of the Colorado River floodplain. The Project area is on Palo Verde Mesa and is situated in the greater Sonoran Desert. The topography is relatively flat and slopes toward the southeast; elevations range from 260 to 400 feet above mean sea level (AMSL). The Project area is near the Big Maria Mountains on the northwest, the McCoy Mountains on the west, the Mule Mountains on the southwest, and the Colorado River on the east. These mountain ranges, trending northwest to southeast, create a natural barrier between the Colorado River and the greater Colorado Desert.

The subtropical climate of the Colorado Desert is currently characterized by dry, mild winters averaging 45 degrees Fahrenheit (ºF) and dry, hot summers that average 104ºF. Summer highs are known to reach up to 120ºF. Precipitation ranges between two and ten inches per year, with most of the precipitation occurring between November and March. Although rainfall occurs primarily in the winter months, the region is periodically influenced by tropical weather conditions, including sudden monsoonal summer storms, which typically occur from July to later September.

The general area has a long history of human use and disturbance with dominant land uses consisting of agricultural fields and groves (citrus orchards), residences, Blythe Municipal Airport, Blythe Energy Center, electrical transmission lines, an interstate highway, and commercial businesses. Within this matrix of human development and disturbance some patches of open desert habitat remain in the form of creosote bush scrub and desert riparian wash. To the west, the Project area also includes undeveloped open desert that is managed by the U.S. Department of the Interior, Bureau of Land Management (BLM). The solar facility associated with this Project would be situated within agricultural land or otherwise disturbed land (primarily former agriculture and military training), and the generation interconnection ("gen-tie") line within private, disturbed lands and BLM lands. Areas north and west of the Project are preserved as open space for recreational use and wildlife.

1.2 Purpose and Goal of this Avian and Bat Protection Plan

Recent advances in technology along with environmental concerns associated with fossil fuel extraction, transportation, refining and combustion have stimulated the expansion of the renewable energy industry and its promotion through federal, state and local legislative efforts. With its abundant sunshine, desirable climate and proximity to large population centers, the Colorado Desert of Southern California is an ideal location to develop solar energy resources. Consequently, a number of solar energy projects (utilizing a variety of technologies) are in various stages of development in the region.

Concern over bird and bat fatalities (primarily associated with commercial wind farms) has led to increased attention from resource management agencies and efforts to minimize impacts to birds and bats from any renewable energy development. These efforts often include systematic monitoring to quantify effects on birds and bats, increasing agency coordination or consultation, risk assessments, and application of design and operational strategies to reduce impacts. Efforts are typically set forth and documented in planning documents such as ABPPs, sometimes known as Bat and Bird Conservation Strategies (USFWS 2010). ABPPs establish a commitment to identify and address known causes of bird and bat mortality that could occur from normal operation activities, and are intended to provide a framework for compliance with federal and state laws. The USFWS has prepared an interim guideline for developing project-specific ABPPs for solar energy facilities and associated transmission lines (USFWS 2010).

Based on specific recommendations from USFWS, this ABPP presents a good-faith, voluntary effort by the Proponents to initiate a program to minimize bird and bat mortality during both construction and operations at the Blythe Mesa Solar Project site. Specifically, this ABPP provides:

- A statement of the Proponents' understanding of the importance of bird and bat safety and management's commitment to remain in compliance with relevant laws
- Documentation of conservation measures BMSP is implementing through design and operations to avoid and reduce bird and bat fatalities at both solar generation facilities as well as the associated gen-tie line
- Consistent, practical and up-to-date direction to BMSP staff how to avoid, reduce and monitor bird and bat fatalities
- Establishment of accepted processes to monitor and mitigate bird and bat fatalities,
- Establishment of accepted fatality thresholds that, if surpassed, will trigger adaptive changes to management and mitigation management
- An adaptive management framework to be applied, if thresholds are surpassed.

ABPPs are considered "living documents" that articulate a power producer's commitment to develop and implement a program to increase avian and bat safety and reduce risk. As progress is made through the program or challenges are encountered, the ABPP may be reviewed, modified and updated. The initial goals of this ABPP are to:

- Provide a framework to facilitate compliance with federal law protecting avian species and means to document compliance for regulators and the interested public
- Allow the Proponents to manage risk to protected bird and bat species in an organized and cost-effective manner
- Establish a mechanism for communication between BMSP managers and natural resource regulators (primarily USFWS)
- Foster a sense of stewardship with BMSP owners, managers and field engineers
- Articulate and cultivate a culture of wildlife awareness (specifically birds and bats) and the importance of their protection.

As stated above, it is presumed that this avian and bat protection plan is a "living document" and will be modified or updated based upon changing conditions, site modifications, unforeseen events, and evidence of lower risk. New versions will be dated and given a revision number.

This ABPP is not to be considered a delineation of legal requirements. Instead, it provides guidance for achieving and maintaining regulatory compliance, minimizing risk, and documenting good-faith efforts to maintain bird and bat safety associated with the Blythe Mesa Solar Project.

1.2.1 Coordination with Others

Early coordination and pre-consultation with the USFWS, the California Department of Fish and Wildlife (CDFW), the County of Riverside, and the BLM was conducted during a series of meetings, email correspondences, and phone conversations. The early coordination helped guide the approach and need for the development of this ABPP. A summary of coordination and consultation to date is provided below (Table 1).

Table 1. Coordination with Agencies

Agency	Study Component	Date	Type of Contact	Summary
USFWS, CDFW, County of Riverside	Biological surveys	August 23, 2011	Meeting	Project Overview and discussion of biological resources and surveys needed.
Kim Marsden, BLM	Review of Survey effort	March 29, 2012	Meeting	Review of Biological Resources, existing data, site conditions, and surveys completed. Also discussed data needs moving forward.
USFWS, BLM, County of Riverside	Review of Project information, including the biological data collected	May 10, 2012	Meeting	This meeting was a pre-application meeting. Several resources were discussed in addition the biological resources.
Shankar Sharma and Magdalena Rodriguez, CDFW	Review of survey effort.	June 13, 2012	Meeting	Review of Previous Studies in Project Area & Vicinity, Analysis of Existing Conditions, Survey Work and Present Findings and Steps moving forward
Nisa Marks, USFWS	Avian Data	August 09, 2012	Email Correspondence	Reviewed the relevant and available migratory bird species data that was collected for BMSP. Requested that the next steps would be to prepare a ABPP
Kim Marsden, BLM; Jared Bond, County of Riverside	Habitat Assessment data along the transmission line alternatives	August 30, 2012	Email Correspondence	Submitted the BMSP Bio Transmission Line Alternative Habitat Assessment Report for review.
Jared Bond, County of Riverside	ABPP and Burrowing Owl Protection Plan	September 20, 2012	Phone conversation	Review of Habitat Assessment Report and suggested the preparation of a burrowing owl plan and ABPP.
Nisa Marks, USFWS	Avian and Bat Protection Plan	October 22, 2012	Email Correspondence	Provided written guidance for preparing a ABPP for solar projects
USFWS	ESA species	November 14, 2012	Letter	Concurrence that the BMSP is not likely to incidentally take or affect ESA species, specifically the desert tortoise

1.3 Regulatory Framework

Native birds and bats in the U.S. are afforded protection under federal and state laws, including the Endangered Species Act (ESA), the Migratory Bird Treaty Act (MBTA), the Bald and Golden Eagle Protection Act (BGEPA), and provisions of the California Code.

1.3.1 Federal

Endangered Species Act (ESA): The ESA is administered under the U.S. Fish and Wildlife Service (USFWS). The purpose of the ESA is to "provide a means whereby ecosystems upon which endangered and threatened species depend may be conserved, and to provide a program for the conservation of these species." Section 9 of the ESA prohibits purposeful or incidental "take" of listed species, including killing or harming a listed species or its habitat. Any activity that is expected to result in incidental take of a threatened or endangered species requires a USFWS permit issued under section 7 or 10 of the ESA. It should be noted that no federally-listed bird or bat species is known to occur of find habitat with the area of the Project's solar array fields or gen-tie line. Future revisions of this ABPP will note changes in listing status of any covered species.

Migratory Bird Treaty Act (MBTA): All native birds in the U.S. are protected under the Migratory Bird Treaty Act. The MBTA states that "Unless and except as permitted by regulations…it shall be unlawful at any time, by any means, or in any manner to pursue, hunt, take, capture, [or] kill…any migratory bird". Unauthorized take of any of the protected bird species constitutes a violation of the MBTA. The USFWS has established permits for certain intentional activities that result in take, such as scientific research and hunting, but currently does not provide provisions for the incidental take of migratory birds at energy facilities. Consequently, there is no permitting framework that allows a renewable energy developer to protect itself from the liability of take. However, demonstrable good faith efforts to affectively avoid and minimize impacts are considered by USFWS prior to MBTA enforcement actions.

Bald and Golden Eagle Protection Act (BGEPA): The BGEPA prohibits the take of any bald or golden eagle. "Take" is defined as "Pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest, or disturb." "Disturb" means "to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, 1) injury to an eagle, 2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or 3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior." Recent USFWS regulations (Federal Register 74:46836-46879, September 11 2009) allow for the issuance of permits for eagle take that is associated with, but not the purpose of, an activity. Permits may be issued when "the take is unavoidable even though advanced conservation practices are being implemented." Stipulations of the permitting framework include periodic monitoring of eagle use near the project during and for three years following the proposed activity (50 CFR 22:26). Such permitting has not been identified for this Project nor anticipated.

It should be noted that each avian protection regulation described above includes the concept of "take." Section 9 of the ESA most clearly defines take as "to harass, harm, pursue, hunt, shoot, wound, kill trap, capture, or collect or attempt to engage in any such conduct." "Harm" has been further defined as "an act which actually kills or injures wildlife by significantly impairing essential behavior patterns, including breeding, feeding, or sheltering."

The active nests of all migratory birds are afforded protection. Both active and inactive nests of eagles and colonial nesting birds are afforded protection. Disturbance or destruction of a nest in any protected category is considered "take" under the law.

Northern and Eastern Colorado Desert Coordinated Management Plan (BLM 2002): The Northern and Eastern Colorado Desert Coordinated Management (NECO) Plan is a landscape-scale, multi-agency planning effort that protects and conserves the natural resources of the California portion of the Sonoran Desert while also managing its use for humans. This plan was prepared under the same regulations that implement the FLPMA of 1976. The NECO Plan provides management areas for the desert tortoise (*Gopherus agassizii*), a system of integrated ecosystem management for special-status species and natural communities on federal lands, and regional standards and guidelines for public land health on BLM lands. This management plan is only applicable to BLM administered lands within the gen-tie line ROW.

California Desert Conservation Area Plan: The California Desert Conservation Area (CDCA) Plan guides the management of all BLM-administered lands in the Mojave, Sonoran, and a small portion of the Great Basin Deserts. In total, the CDCA Plan includes an area of approximately 25 million acres, 12 million of which are public lands. The primary goal of the CDCA Plan is to provide guidance for the overall maintenance of the land while simultaneously planning for multiple uses and balancing the human needs with the need to protect the natural environment. This management plan is only applicable to BLM administered lands within the gen-tie line ROW.

1.3.2 State

California Endangered Species Act of 1984, California Fish and Game Code § 2050-2098: The California Endangered Species Act (CESA) includes provisions for the protection and management of species listed by the State as endangered or threatened, or designated as candidates for such listings. CESA includes a requirement for consultation "to ensure that any action authorized by a state lead agency is not likely to jeopardize the continued existence of any endangered or threatened species… or result in the destruction or adverse modification of habitat essential to the continued existence of the species" (§ 2090). Plants of California declared to be endangered, threatened, or rare are listed at 14 California Code of Regulations (CCR) § 670.2. Animals of California declared to be endangered, threatened, or rare are listed at 14 CCR § 670.5. The administering agency for the above authority is the CDFW.

California Fish and Game Code Section 3503, 3511, 4700, 5050, and 5515: These California Fish and Game Codes (CFGC) list bird (primarily raptor), mammal, amphibian, and reptile species that are classified as fully protected in California. Fully protected species are prohibited from being taken or possessed except under specific permit requirements. These Codes also prohibit the take, possession, or needless destruction of the nests or eggs of any bird, including birds of prey or their nests or eggs, except as otherwise provided by the code or any regulation made pursuant thereto.

1.3.3 Local

No relevant local ordinances related to birds or bats applicable to this ABPP are identified at this time.

1.4 Corporate Policy and Commitment to Environmental Protection

It is the policy of the Proponents, their owners, and management to balance the goal of providing clean, renewable energy with the protection of bird and bat resources that may be affected by its generation and transmission facilities. The Proponents are committed to a good-faith effort to comply with applicable laws regarding bird and bat safety and with developing and operating its BMSP in a way that minimizes direct impacts on wildlife. This Avian and Bat Protection Plan presents the Proponents' commitment to minimize impacts on local bird and bat populations.

2.0 ENVIRONMENTAL SETTING

2.1 Data Collection

The evaluation of habitats and species with the potential to be affected by the Project included a review of available information supplemented with reconnaissance-level survey and focused surveys. Methods are detailed in the Biological Resources Technical Report (POWER 2011) prepared to support the Blythe Mesa Solar Project Draft Environmental Impact Report/Environmental Assessment (EIR/EA) for the California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA) process. Collected data are synthesized into the baseline conditions summary presented in section 2.2 below.

2.1.1 Desktop Exercise

Preliminary environmental review of the Project area included review of information obtained from the USFWS, CDFW, BLM, Cibola National Wildlife Refuge, literature searches, reports from surrounding projects, examinations of aerial photographs, and database searches including the California Native Plant Society (CNPS), California Natural Diversity Data Base (CNDDB) records, and other sensitive species accounts for Riverside County. Regional resource planning documents prepared by federal, state and local agencies were also reviewed, including the NECO Plan, the CDCA Plan, and the Riverside General Plan. Additionally, USFWS was consulted regarding the federally listed species that could occur within the Project quads.

To identify the existing and potential biological resources present in the vicinity of the proposed Project, a Geographic Information System (GIS) search was performed. This consisted of mapping baseline biological resource data (vegetation mapping, CNDDB records, habitat conservation areas, water resources, and potential jurisdictional areas). The following US Geological Survey quadrangles were reviewed for the Project development area and environs: McCoy Wash, Ripley, and Roosevelt Mine.

Additional references used included soil data from the US Department of Agriculture, the Jepson Manual, the CNPS Inventory of Rare and Endangered Plants of California, and several other published and technical survey reports for the region. By reviewing vegetation, soils and surveys conducted by other projects in the area, biologists were able to determine where focused surveys were required and where recently acquired existing data may be able to be used for a species inventory instead. The surrounding projects that were reviewed for existing survey information include:

- Blythe Solar Power Project (AECOM 2010)
- Genesis Solar Energy Project (BLM and CEC 2010, TetraTech 2010a, TetraTech 2010b)
- Devers-Palo Verde No. 2 Transmission Line Project (Aspen 2006)
- Devers-Palo Verde No. 2 Transmission Line Project Telecommunication System Route (CH2MHill 2010)
- Devers-Palo Verde No. 2 Transmission Line Project Colorado River Substation Expansion (Aspen 2011)
- First Solar Electric Blythe Solar 1 Project (First Solar Electric, LLC (First Solar). No Date)
- Blythe Airport Solar Project (US Solar Holdings, LLC (US Solar). No Date.)
- McCoy Solar Energy Project (BLM 2012)
- Rio Mesa (Bright Source Energy, Inc.)

These projects were reviewed for survey information, including target species, survey areas, survey dates, and survey results. This was conducted through a combination of document reviews and reviews of project spatial data, when available. Because birds and bats are wide-ranging creatures,

such information on surrounding projects can help identify transient species, rare species, or target species that may have elevated concern or require specific mitigation.

2.1.2 Baseline Biological Surveys

Prior to field reconnaissance surveys, biologists first developed a potential list of special-status species by consulting the CNDDB (RareFind Version 3.1.1; CDFW 2011) and CNPS Inventory of Rare and Endangered Plants (2011) for documented occurrences of special-status or rare plants and animals within the McCoy Wash, Ripley, and Roosevelt Mine USGS 7.5-minute quadrangles. These resources, along with the species range maps, were utilized to determine historic occurrence of special-status plant and wildlife species and other natural resources within the study area. Additionally, USFWS was consulted regarding the federal listed species that could occur within the Project quads (see Appendix C in Biological Resources Technical Report, POWER 2011).

Once a complete list was developed of potential species that could occur within the Project area, POWER conducted a general reconnaissance survey. The reconnaissance survey was conducted in the proposed solar array footprint by POWER biologists Tom Herzog and Ken McDonald on April 19 and 20, 2011. The survey was a comprehensive habitat assessment conducted across the solar facility site and 500-foot wide transmission line corridor (which is centered on the assumed centerline) , identifying key habitat features and observations of both plants and wildlife (including any birds and bats).

Species-habitat correlations assume the occurrence of an organism with a series of environmental variables. Environmental variables can describe the habitat components organisms are dependent upon and, therefore, predict their pattern of habitat occupancy. Therefore, a habitat-based survey approach was used to assess the Project footprints.

The field survey evaluated the quality of the habitat for each species and/or proximity of the habitat to a known occurrence of a species. Information used to determine known occurrence locations included CNDDB data, CNPS records, consultation with Wildlife Agencies, and reference to published species accounts. Field survey activities included documenting plant and animal species or sign observed within the study corridor, mapping vegetation communities, and photo-documenting existing biological conditions for all identified potential Project routes.

2.2 Existing Conditions

Prior to Project development, agricultural land use within the solar array site included drip-irrigated citrus orchards, flood-irrigated alfalfa, non-irrigated winter wheat, abandoned jojoba orchards, and fallow fields. Some additional land was heavily disturbed and had been used for World War II-era military training. Less than five percent of the area supported disturbed remnant creosote bush scrub and bajada habitat. In contrast, the gen-tie line corridors pass through BLM lands and other private lands mainly comprising desert scrub habitat and disturbed lands associated with existing infrastructure. Several utility lines and maintenance roads run through or parallel the gen-tie line corridors. Additionally, the Project area has been previously disturbed by off-road vehicle use, trash dumping, and historic use for military training during World War II. The Project site is located in the Colorado Desert in gently rolling open terrain dominated by desert scrub vegetation. The Colorado Desert is a part of the larger Sonoran Desert, which extends across the southwest United States and into Mexico. The climate is very hot and dry in the summer months, and cool and moist in the winter.

Surface water is minimal on Palo Verde Mesa and consists of limited seasonal and perennial sources. Perennial water comes from McCoy Springs in the McCoy Mountains west of the Project area and the Colorado River, which lies approximately eight miles east of the Project area. The Colorado River is the source of irrigation water for agriculture in the area.

No designated critical habitat, special management areas, wilderness study areas, or Areas of Critical Environmental Concern (ACEC) are located within the solar array site or gen-tie line corridors.

2.2.1 Vegetation and Habitat

Based on initial surveys, eleven vegetation communities and other cover types were identified within the Project development area (solar array sites and gen-tie line ROWs). Vegetation communities were classified according to the second edition of *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009). Community classifications were based on dominant species comprising approximately 50 percent or more of the total cover within the mapped unit relative to the list of dominant species for a given vegetation community. Habitat mapping is presented in the biological resources technical report (POWER 2011). Vegetation communities included the following:

***Bajada*.** Bajadas are associated with broad merged alluvial fans or desert washes. This community is present in the northeastern corner of the Project area and is typically characterized as the shallow, sandy, braided bottoms of wide canyons. This community most closely resembles Holland's "Mojave Desert Wash Scrub," Code 63700 (Holland 1986).

Creosote Bush Scrub/Disturbed Creosote Scrub. Within the study area, this community is characterized by sandy soils with a shallow clay pan on a broad gentle southeast-trending slope. Dominant plants within the study area for this community include creosote bush, burro brush, brittlebush (*Encelia farinosa*), and cheesebush. This is the most common plant community consisting of non-agricultural plants within the study area. This plant community intergrades into the desert riparian woodland wash. Within the study area, there are areas of desert pavement that are covered with rounded cobbles that range in size from one to three inches. Typically, these areas are higher than the surrounding landscape by three to 15 feet. These areas are within creosote bush scrub, though the plant density is lower. Sonoran creosote bush scrub is designated by Holland as Code 33100 and Sawyer Keeler-Wolf and Evens as the Ocotillo Series (Holland 1986 and Sawyer et al. 2009). Within the gen-tie corridors, the creosote bush scrub is relatively undisturbed, except for occasional vehicle tracks. In these areas, fine sand drifts are interspersed within this community type; the Emory's indigo bush occurs in stands and is more prevalent than in other portions of the creosote bush scrub.

There are more areas of disturbed creosote bush scrub on the solar facility site compared to the gen-tie line. Past disturbances in these areas consist of military training and agricultural use, including cultivation of jojoba (*Simmondsia chinensis*). These disturbances occurred in the past, and the Sonoran creosote bush scrub within the solar array area has been recovering through natural recruitment. Two invasive plant species, Russian thistle (*Salsola tragus*) and Sahara mustard (*Brassica tournefortii*), can be found in disturbed areas throughout the study area, especially near roads and fallow and active agricultural areas. Another exotic plant, Mediterranean grass (*Schismus* sp.), is prevalent throughout the creosote bush scrub.

Desert Riparian Woodland Wash. This vegetation community consists of open, drought-deciduous, riparian scrub woodland and is made up of three primary components: wash-dependent vegetation, vegetated ephemeral dry wash, and islands of Sonoran creosote bush scrub (e.g., riparian interfluves). Dominant and indicator plants of this community within the study area include honey mesquite (*Prosopis glandulosa*), palo verde (*Cercidium floridum*), desert ironwood (*Olneya tesota*), cat-claw acacia (*Acacia greggii*), and rush milkweed (*Asclepias subulata*). Creosote bush (*Larrea tridentata*) and burro brush (*Ambrosia dumosa*) were scattered throughout the canopy. The herbaceous layer is dominated by desert plantain (*Plantago ovata*), *Cryptantha* spp., and Mediterranean grass (*Schismus barbatus*). Of the vegetation communities listed in Table 3.2.4-1, the CDFW considers desert riparian woodland wash to be a sensitive habitat/biological resource. In addition, desert riparian woodland wash is a special community type (i.e., high priority for inventory in the CNDDB) per the CDFW's

Vegetation and Mapping Program. Desert riparian woodland wash is equivalent to Holland's desert dry wash woodland (Code 62200) and Sawyer, Keeler-Wolf and Evens' Catclaw Acacia Series (Holland 1986 and Sawyer et al. 2009).

Irrigated Cropland/Irrigation Pond/Orchard/Jojoba/Wheat. These community types fall into the broader category of agriculture. The majority of agricultural land within the proposed solar array disturbance area is fallow and active agriculture. It includes lands that are currently under cultivation and those that are abandoned (e.g., fallow). Within abandoned agriculture areas, native vegetation is growing back; Russian thistle, Sahara mustard, and other exotic plants were observed interspersed with the native vegetation and are indicative of past agricultural disturbance.

Disturbed/Ruderal. Disturbed/Ruderal communities have been previously disturbed and have been converted to mostly non-native, weedy areas. Ruderal vegetation is that which grows quickly in disturbed areas and may consist of native species, such as fire-following plants, or non-native species, such as invasive grasses or forbs. Examples of invasive species that would occur in these areas include redstem filaree (*Erodium cicutarium*), Sahara mustard, and Mediterranean grass. Ruderal areas in the Project area are primarily concentrated within the proposed solar array area.

2.2.2 Avian and Bat Species in the Project Area

Because of agricultural development and general state of disturbance, the solar facility site provided little habitat for bird or bat species prior to construction. In contrast, the gen-tie line extends westward through undeveloped BLM lands supporting wildlife habitats. Certainly the gen-tie ROW supports a community of desert scrub bird species and seasonal transient migrants. Terrain across the entire area is relatively level with deep alluvium and no exposed rock features. No bat roost habitat is presented within the Project development areas or adjacent areas. Bat species may occur as daily or seasonal transients, but would not otherwise be expected to occur. Based on a review of available information, studies conducted for nearby projects, reconnaissance surveys and protocol surveys conducted as part of impacts assessment for the Project, Table2 presents a list of special status bird and bat species as well as their occurrence potential within the Project development area (solar generation site and gen-tie line ROWs). No federally-listed or state listed bird or bat species were detected at the Project site or are expected to find habitat at the Project site. Three non-listed special-status avian species or their sign were detected on site, including the western burrowing owl, Le Conte's thrasher, and loggerhead shrike. Detections of all wildlife species are discussed in detail in the Biological Technical Report (POWER 2011).

Table 2. Special-Status Bird and Bat Species Occurrence Potential within the Project Development Area

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array Project Boundary[2]	Potential for Occurrence within the Gen-tie Line (BLM Jurisdiction)[2]
Birds					
Golden Eagle (*Aquila chrysaetos)*	BGEPA species, CDFW: Species of Special Concern, BLM Sensitive	Nest in high relief areas with exposed rock (e.g., cliffs or canyons). Forage widely over level terrain.	Known to region. According to McCoy Solar Energy Project survey data (Tetra Tech EC, Inc. 2012) there were numerous golden eagle nests detected in the McCoy and Big/Little Maria Mountains, but only one of 19 was found to be active (in 2010). Expected to use area for foraging.	Moderate (may traverse level terrain)	Moderate (forage habitat present)
Short-eared owl *Asio flammeus*	CDFW: Species of Special Concern	Open fields, marshes, dunes, and grasslands.	Some suitable habitat for this species is present in and around the solar array boundary, but habitat is more marginal around the gen-tie line. No CNDDB records in the Project vicinity.	Moderate	Low
Western burrowing owl (*Athene cunicularia hypugaea*)	CDFW: Species of Special Concern, BLM: Sensitive, NECO Plan	Found mainly in grassland and open scrub from the seashore to foothills. Also found in deserts and scrublands.	Habitat marginally suitable for this species within the gen-tie corridors. May be occasionally present as foragers but unlikely to be present as residents. Suitable habitat and the species were detected within the solar array site during the survey work.	Present	Moderate
Swainson's hawk (*Buteo swainsoni*)	CESA: Threatened, USFS: Sensitive	Nesting habitat consists of open habitats with trees, either isolated, scattered or in windrows.	Migrants more frequently occur near western edge of desert such as Borrego and Morongo valleys, as reflected in annual data from the various regional hawk-watch reports. No suitable breeding habitat exists on site.	Low (non-breeding only) High (foraging)	Low (non-breeding only) High(foraging)
Vaux's swift (*Chaetura vauxi*)	CDFW: Species of Special Concern	Occurs in coniferous forests, particular redwoods and Douglas-firs. Usually nests in flocks in large hollow trees or snags. Forages over rivers and lakes.	No nesting habitat occurs in or near the Project area. Nesting habitat located primarily in mountains in coniferous habitat. May forage in water bodies in the Project vicinity but foraging habitat expected to be minimal or not present within the Project area. No CNDDB results in the Project vicinity.	Low	Low
Mountain plover *Charadrius montanus*	CDFW: Species of Special Concern, BLM: Sensitive	Occurs in short grasslands or other flat areas with short or no vegetation. Most often found in grazed areas.	Habitat for this species is primarily found in agricultural fields in and surrounding the solar array boundary. The gen-tie line contains marginal habitat for this species. Only CNDDB record for this area is a non-specific location in the general Blythe vicinity from 1981.	Moderate	Low

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array Project Boundary[2]	Potential for Occurrence within the Gen-tie Line (BLM Jurisdiction)[2]
Northern harrier (*Circus cyaneus*)	CDFW: Species of Special Concern	Occurs in coastal salt and freshwater marshes, usually nesting on the ground in shrubby vegetation in the surrounding grasslands, especially at the marsh's edge. Also forages in grasslands.	No suitable habitat observed in Project area.	None	None
Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)	ESA: Candidate, CESA: Endangered	Nests along large river systems, typically in areas dominated by willows and cottonwoods.	No suitable habitat observed in Project area.	None	None
Gilded flicker *Colaptes chrysoides*	CESA: Endangered	Found in desert habitat and riparian woodlands along the Colorado River, utilizing willows, cottonwoods, and saguaro.	Limited habitat for this species in the washes in and around the Project area. Closest CNDDB record for this species is approximately nine miles away at the edge of the Colorado River.	Low	Low
Sonoran yellow warbler (*Dendroica petechia sonorana*)	CDFW: Species of Special Concern, NECO Plan	Occurs in riparian deciduous habitat, such as cottonwood and willow areas, nesting in understories. Summer resident of the Colorado River Valley.	Some potentially suitable habitat located on the eastern edge of the gen-tie line and just north of the gen-tie line. One yellow warbler detected just north of the gen-tie line during surveys conducted for the McCoy Solar Energy Project (Tetra Tech EC, Inc. 2012).	High	Present
Southwestern willow flycatcher (*Empidonax traillii extimus*)	ESA: Endangered, CESA: Endangered, NECO Plan	Riparian woodlands.	No suitable habitat observed in Project area.	None	None
Peregrine falcon (*Falco peregrinus*)	CDFW: Fully Protected	Nests on cliffs, banks, dunes, mounds, human structures, or other types of depressions or ledges near wetlands, lakes, rivers, or other bodies of water.	No suitable habitat observed in Project area.	None	None

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array Project Boundary[2]	Potential for Occurrence within the Gen-tie Line (BLM Jurisdiction)[2]
Yellow-breasted chat (*Icteria virens*)	CDFW: Species of Special Concern	Inhabits riparian willow thickets near watercourses. Nests in low, dense riparian areas. Summer resident.	No suitable habitat observed in Project area.	None	None
Loggerhead shrike (*Lanius ludovicianus*)	CDFW: Species of Special Concern	Occurs in semi-open country with utility posts, wires, and trees to perch on.	Pair detected just north of the northern alternative. Suitable habitat occurs along the southern alternative but no individuals were detected.	High	Present
Gila Woodpecker (*Melanerpes uropygialis*)	CESA: Endangered, NECO Plan	Nests in cottonwoods or other desert riparian trees, shade trees, or date palms.	Limited suitable habitat available in the Project area. Nearest occupied habitat is near Blythe on the Colorado River.	Low	Low
Elf owl (*Micrathene whitneyi*)	CESA: Endangered, NECO Plan	In California, nests only in cottonwood-willow and mesquite riparian areas along the Colorado River.	No suitable nesting habitat in Project area. May forage in or near the Project area.	Low	Low
Lucy's warbler (*Oreothlypis luciae*)	CDFW: Species of Special Concern	Occurs primarily in thickets of mesquite, riparian scrub, and tamarisk in the lower Colorado River Valley and its tributaries.	Limited suitable habitat located in areas of desert riparian woodland wash.	Low	Low
American white pelican (*Pelacanus erythrorhynchos*)	CDFW: Species of Special Concern	Nests on large lakes and protected and isolated islets within them.	No suitable habitat observed in Project area.	None	None
Summer tanager (*Piranga rubra*)	CDFW: Species of Special Concern	Requires cottonwood-willow riparian forests for nesting and foraging. Summer resident on the Colorado River.	No suitable habitat present in the Project area.	None	None

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array Project Boundary[2]	Potential for Occurrence within the Gen-tie Line (BLM Jurisdiction)[2]
Vermilion flycatcher (*Pyrocephalus rubinus*)	CDFW: Species of Special Concern, NECO Plan	Open farmlands, shrubby grasslands, streamsides, and small wooded ponds in desert habitat. Found in diverse areas near open water.	Limited suitable habitat within the proposed alternatives.	Moderate	Low
Yuma clapper rail (*Rallus longirostris yumanensis*)	ESA: Endangered, CESA: Threatened, CDFW: Fully Protected	Nests in freshwater marshes surrounded by tules and cattails. Found along the Colorado River.	No suitable habitat within the Project area.	None	None
Bendire's thrasher *Toxostoma bendirei*	CDFW: Species of Special Concern, BLM: Sensitive	Occurs in open, arid areas, especially in grasslands.	Marginal habitat in the Project area. No CNDDB records in the Project vicinity.	Low	Low
Crissal thrasher (*Toxostoma crissale*)	CDFW: Species of Special Concern, NECO Plan	Occurs in dense riparian and mesquite scrub, microphyll woodland, and riparian washes with a dense understory of shrubs	Some habitat present that could support species foraging but not typical for nesting. Riparian wash present south of the southern alternative. An unidentified thrasher was heard calling during the survey on the northern alternative.	Low	Moderate
Le Conte's thrasher (*Toxostoma lecontei*)	CDFW: Species of Special Concern, NECO Plan	Arid and open plains that are sparsely vegetated and dominated by saltbush and creosote bush	This species was previously detected in 2011 in an area between the northern and southern alternatives. Suitable habitat for this species is present mainly in the creosote bush areas of the Project. An unidentified thrasher was heard calling during the survey on the northern alternative.	High	Present
Arizona Bell's vireo *Vireo bellii arizonae*	CESA: Endangered	Occurs in the summer along the Colorado River, primarily in thickets of willow, mesquite, or other small riparian trees and shrubs.	No suitable habitat observed in Project area. The habitat in the desert riparian woodland wash is marginal. Nearest CNDDB occurrence is approximately nine miles away near the Colorado River.	None	Low

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array Project Boundary[2]	Potential for Occurrence within the Gen-tie Line (BLM Jurisdiction)[2]
Yellow-headed blackbird (*Xanthocephalus xanthocephalus*)	CDFW: Species of Special Concern	Nests in freshwater wetlands with dense vegetation and deep water, as well as along the borders of other lacustrine water bodies.	No suitable habitat observed in Project area.	None	None
Bats					
Pallid bat (*Antrozous pallidus*)	CDFW: Species of Special Concern BLM: Sensitive NECO Plan	This gregarious species usually roosts in small colonies in rock crevices and buildings, but may nest in caves, mines, rock piles, and tree cavities.	Roosting habitat for pallid bats is present in tree cavities in desert riparian woodland wash in the southeastern portion of the survey area. The closest documented occurrence in the CNDDB is from 1992, approximately 30 miles to the southwest of the airport near Corn Springs.	Low	Low
Townsend's big-eared bat (*Corynorhinus townsendii*)	CDFW: Species of Special Concern BLM: Sensitive NECO Plan	Occurs in a wide variety of habitats but most commonly in mesic areas. Roosts in open areas.	Suitable foraging habitat within the Project area but limited roosting habitat. The closest CNDDB record is from 1919 and is approximately seven miles southeast of the surveyed areas.	Low	Low
Spotted bat *Euderma maculatum*	CDFW: Species of Special Concern, BLM: Sensitive	Occurs in a large number of different habitats, feeding over water and in washes. Roosts in rock crevices, cliffs, or caves.	There is very little wash habitat for foraging available on-site, with some in the vicinity outside of the Project area. There is no roosting habitat on-site.	Low	Low
Western mastiff bat *Eumops perotis*	CDFW: Species of Special Concern, BLM: Sensitive	Occurs in a large number of different habitats, roosting in crevices in cliffs, high buildings, trees, and tunnels.	Limited roosting habitat is available on-site.	Low	Low
Western yellow bat (*Lasiurus xanthinus*)	CDFW: Species of Special Concern	Occurs in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats. Roosts in trees and forages over water and in trees.	No roosting habitat available in the Project area; no water observed during surveys. The only CNDDB record is from 1980 and is mapped in Blythe.	Low	Low

Common Name Scientific Name	Sensitivity Status[1]	Habitat Requirements	Discussion	Potential for Occurrence within the Solar Array Project Boundary[2]	Potential for Occurrence within the Gen-tie Line (BLM Jurisdiction)[2]
California leaf-nosed bat (*Macrotus californicus*)	CDFW: Species of Special Concern BLM: Sensitive NECO Plan	Lowland desert scrub, desert riparian and wash areas, alkali scrub, or palm oases. Requires rugged or rocky terrain with mines or caves for roosting.	Suitable foraging habitat is present throughout the Project area, although roosting habitat is limited in the immediate region, due to lack of a rugged or rocky terrain. A 2002 CNDDB record lists a colony of bats in the general vicinity (in the Roosevelt Mine quad), but specific location information is suppressed and it is unclear which species of bat may be present.	Low	Low
Arizona myotis (*Myotis occultus*)	CDFW: Species of Special Concern	Lowlands of the Colorado River and adjacent desert mountain ranges. Roosts in tree hollows, rock crevices, and similar areas.	The closest documented occurrence in the CNDDB is from 1942, approximately five miles south of the Project.	Low	Low
Cave myotis (*Myotis velifer*)	CDFW: Species of Special Concern BLM: Sensitive NECO Plan	Low elevation arid regions near the Colorado River and in adjacent mountains. Requires caves or mines for roosting.	Suitable foraging habitat is present throughout the Project area, although roosting habitat is limited in the immediate region. A 2002 CNDDB record lists a colony of bats in the general vicinity (in the Roosevelt Mine quad), but specific location information is suppressed and it is unclear which species of bat may be present.	Low	Low
Yuma myotis (*Myotis yumanensis*)	BLM: Sensitive	Prefers open forests and woodlands. Requires water for foraging. Roosts in mines, caves, buildings, and crevices.	No roosting or foraging habitat available within the Project area.	Low	Low
Pocketed free-tailed bat (*Nyctinomops femorosaccus*)	CDFW: Species of Special Concern NECO Plan	Occurs in rocky areas with high cliffs in pine-juniper woodland, desert scrub, palm oasis, desert wash, and desert riparian habitat.	No suitable habitat in Project area.	None	None
Big free-tailed bat *Nyctinomops macrotis*	CDFW: Species of Special Concern	Occurs in arid, hilly regions. Roosts primarily in rock crevices in canyons but can also occasionally be found in buildings and caves.	No suitable habitat in Project area.	None	None

3.0 RISK ASSESSMENT

The primary risk categories to birds and bats posed by photovoltaic solar array development are primarily fatalities due to collision or electrocution through contact with array-associated power lines and tie lines and displacement associated with habitat loss. In addition, bird nests could be at risk during construction activities and during normal maintenance of generation and transmission facilities. Currently bat collision with power transmission and distribution facilities is not recognized as a potentially significant risk. Bats do not build nests. Anticipated risks to birds in general, eagles in particular, and bats will be discussed below within the context of risk factors within these categories.

3.1 Birds

3.1.1 Collision

Under certain conditions, transmission line collisions can be a major factor in avian mortality along utility corridors. Site-specific collision risk is affected by a number of independent factors. Factors that influence collision risk can be divided into three categories: those related to bird biology, those related to the environment, and those related to the configuration and location of transmission lines (APLIC 2006, Savereno et al. 1996).

Biological Factors Related to Bird Collisions

Biological factors include habitat use, body size, flight behavior, age, sex, and flocking behavior. Wetlands tend to have a high concentration of birds nesting, feeding, roosting, and migrating back and forth, and add to the collision risk if transmission lines are nearby (Bevanger 1994).

Many birds, especially raptors, will use transmission poles and towers as perches. This can conserve energy by lowering the amount of time dedicated to flying as the birds search for prey below (APLIC 2006). Bird species that spend an abundance of time in the air may face a greater risk than those that are predominantly ground-based (Bevanger 1994). For example, predators that fly at high speeds when tracking prey such as peregrine falcons or goshawks (*Accipiter gentilis*) may be more likely to collide with a power line. A bird's flight performance has been shown to be one of the most important factors determining the chances of collision with a transmission line, perhaps more important than the sheer frequency of birds flying near the lines (Janss 2000). Juvenile birds, which are not as familiar with the surrounding area and are less experienced in both flight and, in the case of raptors, hunting methods, can be expected to have greater likelihoods of colliding with transmission lines (Bevanger 1994, Bevanger 1998, Dorin and Spiegel 2005). However, larger birds also tend to be more likely to collide with power lines.

Environmental Factors Related to Bird Collisions

Environmental factors influencing collision risk include the effects of weather and time of day for transmission line visibility, surrounding land use practices that may attract birds, and human activities that may flush birds into transmission lines. Overcast weather or thick fog tend to cause birds to lower their flying altitudes. Likewise, headwinds generally cause birds to fly lower, whereas tailwinds may cause birds to fly higher (Bevanger 1994, Perdeck and Speek 1984). High winds may cause some species, especially waterfowl, to fly at lower elevations, increasing collision risk (Hunting 2002). If winds are blowing perpendicular to the wires, this can increase collision possibility even further (Hunting 2002). To the east of the Project area is the Lower Colorado River Valley. The Lower Colorado River Valley is in the Pacific Flyway, one of the four major migration flyways in North America, and is a globally important bird area (IBA) (Audubon 2011). The IBA consists of the Colorado River, associated riparian areas and marshes, and agricultural fields in the area. Waterfowl are known to move daily between water bodies and irrigated agricultural fields to forage (Randall et al. 2011). However, the Project would be to the west of agricultural fields in the Lower Colorado River Valley and would not place any Project

facilities between the river and irrigated agricultural fields. A previous study of avian migrants found that the lowest daily number of migrants was recorded on a day where the average wind speed was 15.5 miles per hour (mph) (Pope et al. 2006). If wind speeds become too strong, thermal formation may be disrupted, reducing the amount of migration through an area. Additionally, excessive cloud cover may also limit ground heating, reducing thermal wind formation and potentially causing a decline in migration of species that predominantly rely on thermals for movement, such as raptors (Pope et al. 2006). Depending on the visibility due to the aforementioned weather conditions or other factors such as rain, fog, or snow, transmission lines may be more difficult to see, increasing the likelihood of a collision (Mathiasson 1992). Visibility can also be affected by the time of day. Lines become increasingly difficult to see at times with poor lighting, such as night, dawn, or dusk, which may pose a greater risk to migratory species because they are not necessarily as familiar with a particular region as resident species. One study found that, during observations of waterfowl flights across a transmission line, out of 433 strikes, 432 occurred at night or during poor weather (Hunting 2002). A similar study at the Lake Sangchris-Kincaid Power Plant in Illinois found that only one in 250,000 waterfowl collided with the power lines during the day (Anderson 1978). Further studies by Stout and Cornwell (1976) also emphasize the risk that poor visibility poses to waterfowl in the midst of power lines. The Project area was selected as a solar generation site because of the prevalence of clear weather.

Wetlands, lakes, and streams are all potential "hot spots" for avian risk due to power lines because water is often used by birds to forage or congregate. However, the proposed power lines are not adjacent to surface water sources and therefore do not pose collision risks to birds as a result of these potential "hot spots." Based on migratory bird data collected from adjacent projects and data collected during the habitat assessment (POWER 2011), it was determined that the agricultural land within the Project site may be used as foraging habitat by raptors or waterfowl that are using the Colorado River. Stout and Cornwell (1976) found that in a review of reported non-hunting mortality of wild waterfowl from 1930 to 1964, 65% of collision mortalities were due to telephone and power lines. A study of migrating mute swans on the coast of Sweden found that, out of 54 swan flocks recorded during the observation period, six flocks had difficulty—but no collisions—crossing power lines, and four mortalities were observed by locals during the same period (Mathiasson 1992). Anderson (1978) postulated that the five factors that most influence waterfowl collision frequency with power lines are: 1) the number of birds present; 2) visibility; 3) species composition and behavior; 4) disturbance; and 5) familiarity with the area. Mathiasson (1992) determined that in his study, the rate of collisions was "mainly a factor of swan frequency and behaviour, and positioning of the wires in the landscape [sic]." Larger water bodies, such as the Colorado River, would theoretically attract more birds, and the more birds that are present, the higher the potential to have a collision with power lines. However, approximately 90,000 acres of irrigated agricultural land is within the Palo Verde Valley which is adjacent to the Colorado River and east of the Project site. Due to the existing suitable forage land east of the Project site and the distance from the Colorado River, it is assumed that migratory birds would only incidentally use the Project site for forage land and that these lands are of lesser value and importance for migratory bird foraging compared to lands closer to the River. If birds are attempting to fly through the area at night when visibility is very poor, especially if they are unfamiliar with the area's vertical spatial layout, the likelihood of a bird flying into one of the lines increases. Therefore, aquatic areas are a determining factor in the risk to avian species. As discussed above, the Project area is in desert scrub without any nearby aquatic features. In addition, the Project's solar generation facility and gen-tie line would not be located between waterfowl use areas. Collision risk to waterfowl species would be low.

Anthropogenic land use is a consideration in evaluating avian collision risk as these features may attract or push birds into areas that contain transmission lines. A simple stretch of highway, for instance, may be an attractive area to vultures or similar species because of the sheer amount of roadkill that is created. Agriculture may attract birds foraging in the vegetation or raptors foraging for crop pests. Relatively dense building clusters may push birds into areas with transmission lines because of the flight obstacles. The gen-tie line would be routed through an area dominated by sparse desert scrub with little

anthropogenic development. It would cross I-10 at its west end and parallel the highway for approximately one quarter mile. However, it would quickly diverge from the highway and be well over one mile from the highway for most of its remaining length. Because of the surrounding conditions and the limited extent of the gen-tie line near the freeway, roadkill is unlikely to cause birds to concentrate near the gen-tie line or drive them towards it. Collision risks associated with anthropogenic land uses is considered low.

Line-related Factors Related to Bird Collisions

Line-related factors include the configuration and location of the transmission line and transmission line placement with respect to other structures or topographic features. While it is believed that horizontal line configurations are less of an avian risk than vertical configurations (Bevanger 1994), power line structure design has not been sufficiently demonstrated to suggest a specific correlation with bird collisions (Janss 2000). However, there seems to be a positive relationship between the presence of a static wire and the number of bird collisions (Bevanger 1994, Savereno et al. 1996). It is thought that, in many cases, the bird sees the conductor wires, changes its altitude to avoid them, and subsequently collides with the thinner, less-visible static wire instead. Consequently, studies have demonstrated an average mortality decline of 50 to 60% when markers are placed on static wires in relation to when wires are left unmarked (Savereno et al. 1996).

Transmission line location can also play an important role in the risks imparted to birds. Generally, there is more of a risk in placing a transmission line corridor in an open area than against an existing backdrop (Bevanger 1994). The risks to birds flying across a single corridor in an open space become dependent not only on the line's visibility, but on the altitude of the bird and its ability to first see the intruding wires, and then change its flight pattern to avoid them. On the other hand, lines that are placed against existing lines or against a landscape reference are theoretically easier to avoid. Multiple lines going through one corridor prevent birds from having to continually change their flight patterns, allowing them to instead avoid several sets of lines all at once. Similarly, lines placed along the base of a cliff, a row of trees, a building, a bridge, or a similar barrier will theoretically help avoid collisions because birds are forced to change their altitude to avoid the impediment (Bevanger 1994). The simple parallel or perpendicular placement of transmission line corridors relative to avian flyways is also an influence on the risk that the lines pose. There tends to be a greater risk in putting lines in between areas necessary for life history, such as foraging and roosting, especially if the two areas are separated by a short distance (Bevanger 1994). If a line is placed near a ridgeline, the risk to avian species can increase. When horizontal winds get deflected upward by ridgelines, the resulting updrafts get used by raptors to gain elevation for gliding purposes. Raptors will also use thermals, which can rise to hundreds or thousands of meters, for gliding purposes (Pope et al. 2006). Lines that are placed near ridgelines can pose collision risks to birds that may be using updrafts or thermals in their migratory paths and may not see the transmission lines in time to maneuver out of the way. Alternatively, canyons or valleys may act as funnels for migrating birds, and can pose collision risks if lines cross perpendicular to the natural direction of flight. Research suggests that wind turbines placed near gullies may pose higher risks to birds passing through (Thelander and Rugge 2000). It may be reasonably assumed that transmission towers, poles, or lines pose a similar risk. If water is present, the issue may become further complicated because more birds have the potential to be attracted to the area as they are migrating through.

Bird collisions also tend to occur with transmission lines when migrant species travel at reduced altitudes near tall structures, such as transmission lines and towers. It is difficult to predict the magnitude of collision-caused bird mortality without extensive information on bird species and movements in the Project vicinity. These data are not available for the gen-tie line; however, the line is constructed on level desert terrain in proximity to existing similar lines and not near any feature that would concentrate avian movements. Based on a review of the known factors influencing avian transmission line collision risk, the proposed gen-tie transmission line does present risk but is not expected to substantially increase avian collision risk above current conditions.

3.1.2 Electrocution

The electrical design factor most crucial to avian electrocutions is the physical separation between energized and/or grounded structures, conductors, hardware, or equipment that can be bridged by birds to complete a circuit (APLIC 2006). Energized components would typically consist of phase conductors, while grounded components could include overhead static wires, neutral conductors, grounding conductors, grounded metal braces, or other pole or tower components. It appears that electrocutions are less common on transmission line towers, because line spacing is at a sufficient distance to lessen the chance of birds completing the electrical circuit (Dorin and Spiegel 2005). High mortality rates are associated with structures that have conductors situated over the crossarms (Janss and Ferrer 2001, Ferrer et al. 1991); Ferrer et al. (1991) found that the least dangerous structures possess insulators below the crossarms. Electrical transmission lines tend to electrocute avian species when the animal touches two conductors, or a positive conductor and a ground, at once, especially if the feather area is wet (Bevanger 1998). Hence, body size and behavior, such as perching and roosting on poles or wires, are the keys to understanding why and how birds become electrocuted. Species frequently affected by electrocution seem to include birds of prey, ravens, and thermal soarers (Bevanger 1998). The majority of raptor electrocutions are caused by power lines that are energized at voltage levels of 69 kV and below, whereas "the likelihood of electrocutions occurring at voltages greater than 69 kV is extremely low" (APLIC 2006).

Electrocutions are largely due to the bird perching on conductors and/or insulators and coming in contact with the energized conductor and grounded insulator base or bonding conductor. While wet feathers may raise the risk of electrocution for a bird by increasing conductivity, dry feathers provide insulation, meaning that in most cases birds are electrocuted when they bridge two energized or an energized and grounded piece of equipment with conductive fleshy parts such as the feet, mouth, bill, or wrists (APLIC 2006). Research has demonstrated that skin-to-skin contact is approximately ten times more dangerous to birds than the amperages conducted by contact between conductors and wet feathers, and approximately 100 times more dangerous than the conductivity between conductors and dry feathers (APLIC 2006). Wet feathers can conduct dangerous amperages beginning at around 5 kV, whereas dry feathers require currents greater than 70 kV before they will begin conducting current. High winds increase the problem by reducing the amount of control that birds have over their flight and landing patterns and increasing the risk that they will collide with transmission lines or accidentally bridge two components on a transmission structure and become electrocuted.

Because of the high voltages involved with the Project's internal and external transmission lines, electrocution is not a risk to even the largest bird species likely to occur in the Project area.

3.1.3 Displacement

Displacement of wildlife may occur due to habitat loss, habitat fragmentation, or avoidance of the area (through habitat changes or human disturbance). PV solar facilities can cover large areas of the landscape. Habitat fragmentation would clearly be an important consideration for solar developments proposed to occur within large, intact, contiguous natural vegetation communities. The Project array areas are sited on agricultural land (irrigated crops and orchards) and disturbed land with very little breeding and foraging habitat suitable for avian or bat species (except as noted above). The gen-tie line traverses more natural habitats of desert scrub and some displacement of breeding or foraging bird could occur during construction. Permanent habitat loss would be minimal within the gen-tie ROW; once completed transmission lines are passive structures not restricting avian or bat use in the area. Some potential for habitat fragmentation exists at the Project site but the potential risk does not appear to be high, because the history of land use in the area (i.e., agricultural land, urban development, interstate highway, transmission line corridor, and energy development), and the due to the nature of the development the lack of potential habitat

3.2 Eagles

3.2.1 Collision

Golden eagles are the largest avian species likely to occur in proximity to Project facilities. Golden eagles may forage widely over broad areas of low-relief desert habitat near steep, rocky roosting or nesting habitat. Bald eagles are larger, but typically forage near large water bodies. Although bald eagles may be found along the Lower Colorado River, some 8.5 miles east of the Project area, their probability of occurrence within the Project area is diminishingly small. For these reasons the following discussion will focus on golden eagles.

Among avian species of the region, golden eagles would be expected to be more susceptible to collisions with transmission elements, presumably due to their flight and foraging behavior. Healthy golden eagle populations contain breeders, juveniles, and "floaters"—subadults or adults that have not settled on a territory (Brown 1969, Hunt 1998, USFWS 2011). Floaters have been shown to be more vulnerable to collision than locally breeding adults and juveniles (Hunt et al. 1999, Hunt 2002). Population stability depends on the non-breeding population of floaters to replace breeding individuals that die (Hunt 1998, USFWS 2011).

Risk to eagles is influenced by four primary factors:

1) the amount of eagle use of the area,
2) residency status (dispersers, migrants, and floaters are at higher risk than resident adults and juveniles)
3) the interaction of topography, wind, and seasons (e.g., wind waves along upwind side of ridges and escarpments used for soaring, gliding, and kiting), and
4) behavior that distracts eagles (e.g., hunting or territorial interaction; USFWS 2011).

The Project area has no golden eagle nest territories recorded with 10 miles. In addition, the Project would be in an area of level terrain and desert scrub with no high relief rocky areas or large tress providing nesting habitat. Wide-ranging golden eagles could traverse the Project area during foraging forays, but this activity would be expected to be low. The Project area would fall within the lowest risk category for golden eagles based on the USFWS draft Eagle Conservation Plan Guidance (2011).

No specific risk to golden eagles is identified at this point. No biological, environmental, design, or operational factors have been identified by the USFWS or the Project developer that would increase specific risk to golden eagles. Nevertheless, if conditions change and increased golden eagle activity in proximity to Project gen-tie facilities is detected during monitoring, management of facilities for eagle safety would be adapted and this ABPP updated to further lower the risk to golden eagles. See Section 6.3 regarding adaptive management, specifically Section 6.3.1, Additional Risk Reduction Measures. In the unlikely event that eagle fatalities are observed at the BMSP area, the Proponents will perform appropriate mitigation (see Section 6.2 regarding fatality thresholds and Section 6.3 regarding adaptive management) and additionally consult with USFWS to determine if it is appropriate to apply for an eagle take permit under BGEPA. No necessity for pursuit of an eagle take permit exists at this time or is anticipated.

3.2.2 Displacement

Displacement of golden eagles may occur due to habitat loss, habitat fragmentation, or avoidance of Project elements. Golden eagle use of the Project area would be expected to be rare and incidental. The Project development areas present no nesting or foraging habitat features that would concentrate eagle activity. For most of its length, the gen-tie line would be over a mile to a mile-and-a-half from I-10. However, at its west end, the gen-tie line would cross the highway in an area of orchards, ruderal land, and an existing transmission line. There are no records indicating that increased road kill associated with

the highway in this area creates an opportunistic carcass food source for eagles. The gen-tie line would not be expected to displace golden eagles from an established food source. Because of the lack of golden eagle occurrence records and the fact that much of the solar site was orchards, the solar array sites would not likely have provided foraging habitat for golden eagles prior to development; this condition would be the same with the Project in operation.

For these reasons, the Project would present very low risk of golden eagle displacement.

3.3 Bats

3.3.1 Collision

Because they are volant, bats could be at some risk of colliding with either gen-tie line, transmission conductors, or PV solar facilities. The Project would be composed of static elements (or with elements that slowly track the sun during the day). Bats are highly maneuverable nocturnal echolocators that can effectively fly through highly cluttered environments.

No collision risk is expected.

3.3.2 Electrocution

All bats that could occur in the Project area or interact with Project energized facilities are small with wingspans less than 16 to 20 inches. It would be highly unlikely for bats to experience electrocution risk from phase to phase or phase to ground contact. The Project presents no electrocution risk for bats.

3.3.3 Displacement

Displacement has not been identified as a risk to bats in recent reviews of renewable energy facility impacts on bats (Kuvlesky et al. 2007, Arnett et al. 2008, Strickland et al. 2011). As most Project development areas consisted of orchards and crop fields, no bat roost habitat was removed or blocked by solar array development. It is possible that some tree roosting bats (either residents or migrants) could have used orchard trees as day roosts in a somewhat opportunistic fashion; however, tree bat species have generally low fidelity for roost sites (Lewis 1995) and groves are prevalent throughout the lower Colorado River Valley that could provide roost sites for displaced bats. No significant displacement risk is expected from the Project.

4.0 PROJECT DESIGN STANDARDS AND IMPACT-REDUCING CONSERVATION MEASURES

4.1 Project Design Features

In general PV solar projects are passive facilities that are low to the ground (within ten feet) and do not present any intrinsic dangers to avian or bat species. With proper siting, design and management through coordination with USFWS and other resource agencies (e.g., CDFW), risk to these species can be further reduced. The BMSP has integrated a number of design standards and best management practices to avoid and reduce impacts to all wildlife (including avian and bat species) during construction and operation. These include, at the coarsest scale, proper siting of facilities on previously-disturbed lands and lands unlikely to concentrate avian or bat activity to the maximum extent possible, design energized facilities using industry accepted standards for avian safety, and the following integrated BMPs:

- **Fire Management and Protection Plan.** As required by existing law (Title 8 California Code of Regulations [CCR] Section 3221), a Fire Management and Protection Plan would be developed in consultation with the Riverside County Fire Department to identify potential hazards and accident scenarios that would exist at the facility during construction, operation, and decommissioning of

the Project. The Plan would include the identification of the following: potential fire hazards and ignition sources; proper handling and storage of potential fire hazards; control of potential ignition sources; persons responsible for equipment and systems maintenance; location of portable fire extinguishers; automatic sprinkler fire suppression system; water-spray fire system; coordination with local fire department; and recordkeeping requirements.

- **Gen-tie lines.** Gen-tie line support structures and other facility structures shall be designed to discourage their use by raptors for perching or nesting (e.g., by use of anti-perching devices). This design would minimize avian risk and would provide the added benefit of not increasing the potential for increased predation of special-status species, such as the desert tortoise be not creating structures that enhance perching or nesting opportunities for ravens or other tortoise predators. Mechanisms to visually warn birds (permanent markers or bird flight diverters) shall be placed on gen-tie lines at regular intervals to prevent birds from colliding with the lines. To the extent practicable, the use of guy wires shall be avoided because they pose a collision hazard for birds and bats. Necessary guy wires shall be clearly marked with bird flight diverters to reduce the probability of collision. Shield wires shall be marked with devices that have been scientifically tested and found to significantly reduce the potential for bird collisions. Gen-tie lines shall utilize non-specular conductors and non-reflective coatings on insulators.

- **Integrated Weed Management Plan.** In compliance with the Federal Noxious Weed Act, the Plant Protection Act, the California Food and Agricultural Code, and the BLM's requirement for a Project-specific integrated weed management plan for the control of noxious weeds and invasive plant species would be prepared. The plan would identify presence, location, and abundance of weed species in the Project area and surrounding area adjacent to the Project, as well as identify suppression and containment measures to prevent the spread of weed species and introduction of weed species. Prevention techniques would include: limiting disturbance areas during construction to the minimum required to perform work; limiting ingress and egress to defined routes; maintaining vehicle wash and inspection stations; and closely monitoring the types of materials brought on site to minimize the potential for weed introduction. During operations, noxious and invasive weed management will be incorporated as a part of mandatory site training for groundskeepers and maintenance personnel. Training will include weed identification and the impacts on agriculture, wildlife, and fire frequencies. Training will also cover the importance of preventing the spread of noxious weeds and of controlling the proliferation of existing weeds.

- **Plants and wildlife.** In compliance with the California Department of Fish and Wildlife Codes, while on the Project property, workers or visitors would be prohibited from: feeding wildlife; moving live, injured, or dead wildlife off roads, ROWs, or the Project site; bringing domestic pets to the Project site; collecting native plants; and harassing wildlife. Areas where wildlife could hide or be trapped (e.g., open trenches, sheds, pits, uncovered basins, and laydown areas) would be minimized. For example, an uncovered pipe that has been placed in a trench should be capped at the end of each workday to prevent animals from entering the pipe. If a special-status species is discovered inside a component, that component must not be moved, or, if necessary, moved only to remove the animal from the path of activity, until the animal has escaped. As open trenches could impede the seasonal movements of large game animals and alter their distribution, they would be backfilled as quickly as possible. Open trenches could also entrap smaller animals; therefore, escape ramps would be installed along open trench segments at distances identified in the applicable land use plan or by the best available information and science. If traffic is being unreasonably delayed by wildlife in roads, personnel would contact the Project biologist, who will take any necessary action.

- Any vehicle-wildlife collisions would be immediately reported to the Project biologist. Observations of potential wildlife problems, including wildlife mortality, would be immediately reported to the BLM or other appropriate agency authorized officer.

4.2 Proponent-Committed Conservation Measures

This section identifies voluntary conservation and impact minimization measures that the Proponents have committed to carry out for the BMSP. These measures were derived through coordination with USFWS and a review of the USFWS *Region 8 Interim Guidelines for the Development of a Project-Specific Avian and Bat Protection Plan for Solar Energy Plants and Related Transmission Facilities* (USFWS 2010). These integrate effective design, construction and operation measures to reduce impacts to bird and bat species and their habitats during construction and operation of the facility. The following measures will be implemented to minimize risk to bird and bat species:

1) Solar arrays for the Project are located on disturbed land used primarily for agriculture. This limits direct loss of bird and bat habitat.
2) All Project generation and transmission elements are located on a level alluvial mesa, far from topographical relief. This characteristic limits transmission line conflicts with raptor flight paths, which often follow the upwind side of ridges and escarpments.
3) The erection of guyed structures is prohibited to reduce avian and bat collision risk.
4) No FAA lighting will be used at the Project site.
5) Where possible, existing roads were used for access roads. New access road construction will be minimized. This limits habitat loss, fragmentation, and displacement.
6) Vegetation clearance and ground surface disturbance will be minimized and within defined and approved work limits.
7) During construction, vegetation clearance will be conducted outside the breeding season to the maximum extent feasible. Pre-construction avian surveys will be conducted in appropriate habitats prior to any human disturbance or ground disturbing activities.
8) In the event that ground disturbing activities are to occur in suitable avian nesting habitat during the breeding season (February 1 to September 15), pre-construction clearance surveys for nesting birds will be conducted by qualified biologists. Identified nests of migratory birds (other than raptors) will be flagged for avoidance with a 300-foot buffer. Work activities will be prohibited within this buffer until the Project biologist determines that the nest has failed or the young have fledged. Activity associated with this nest identification and monitoring will be recorded on appropriate reporting forms (Appendix C).
9) Identified active nests will be avoided up to a distance of 5 miles for golden eagles and up to 600 feet for all other raptors. All construction disturbing activities will be prohibited within this distance to the maximum extent possible during the breeding season (January 1 to July 15, as determined by the Project biologist). Any reduction in this buffer distance will require specific coordination with USFWS.
10) Any nighttime construction will be generally avoided and specifically prohibited within the migratory bird breeding season.
11) Specific measures detailed in the western burrowing owl mitigation and monitoring plan are included here by reference, see Appendix A. Burrowing owls have been identified to occur with Project development areas. Ground disturbing activities will be scheduled to avoid the burrowing owl breeding season (i.e., scheduled to occur between September 1 and January 31). Burrowing owl clearance surveys will be conducted 30-days prior to initial site disturbance within suitable habitats.
12) No Project element will create bat day or night roost sites or provide open water sources that may be attractive to bats or birds.
13) Lighting at the operation and maintenance (O&M) facility and the substation are kept to a minimum to avoid confusing birds or attracting bats. Specifically, the lights at the O&M facility

are downward directed floodlights. Lights at the substation are switched on manually and only used during rare occasions when someone is at the substation at night.

14) Vehicle collision risk to wildlife will be minimized by driving at appropriate speeds within the Project. BMSP will implement a 25 mph speed limit at the Project for site personnel.
15) Garbage at the site will be properly managed to avoid creating an attractive nuisance for bird species.
16) Personnel will remove or bury carcasses found on site that might attract eagles and other avian scavengers.
17) Removal of inactive non-raptor nests from solar generating facilities will occur outside the breeding season
18) The Project will operate under and approved fire management plan to reduce further habitat loss caused by Project-started wildfire.
19) Following the useful life of the Project (likely about 25 years), BMSP will either repower with some future technology or return to the site to agricultural use.

It should be noted that because of the existing conditions of the Project area as developed lands and the low potential for risk to avian and bat species, USFWS advised that a Habitat Equivalency Analysis not be performed for the BMSP (USFWS October 22, 2012 personal communication; see Table 1). Thus, no habitat acquisition, conservation easements or compensatory acreages are developed as part of this ABPP.

4.3 Additional Pre-Construction Surveys and Monitoring

General Avian Species Use: Numerous bird surveys have been completed by solar projects and proposed solar projects surrounding the Project area, including the withdrawn Solar Millennium proposed project (EDAW AECOM and Bloom Biological 2009). For the non-agricultural land within the Project area, information on late spring migrant songbirds and resident birds in native habitats (i.e., Sonoran creosote shrub scrub and desert dry wash woodland) is readily available (EDAW AECOM and Bloom Biological 2009).

Based on migratory bird data collected from adjacent projects, it was assumed that the agricultural land within the Project site may be used as foraging habitat (AECOM 2009). However, due to the existing suitable forage land east of the Project site and the distance from Colorado River habitats (approximately 8.5 miles), it is assumed that migratory birds would only incidentally use the Project area for forage land and that these lands are of lesser value and importance for migratory bird foraging compared to lands closer to the river.

Based on the review of data from surrounding projects and observations in the field of low quality avian habitat on the Project site, avian point count surveys were not conducted during environmental evaluation. Conducting point count survey during environmental review would only provide a snapshot of the migratory species potentially using the site and not aide in species protection during construction and operation; abundance and species diversity would be expected to vary widely each year. However, since it is presumed (based on existing information) that migratory bird species may use the Project site in at least a transient fashion, preconstruction nesting surveys would be conducted. The purpose of these preconstruction surveys is to avoid or minimize specific construction-related impacts on bird species that may be present. (See general pre-construction nesting survey protocol, Appendix B, and nest monitoring forms, Appendix C.)

Western Burrowing Owl: During environmental evaluation, baseline surveys for western burrowing owls were conducted. POWER biologists and Garcia and Associates, Inc. biologists conducted pedestrian survey transects for burrowing owls spaced at approximately 100 feet to allow for 100% visual coverage of suitable habitat within the study area. Where necessary, transect spacing was reduced or expanded to account for differences in terrain, vegetation density, and visibility. Survey methods were derived from generally accepted professional standards, the 1993 California Burrowing Owl Consortium (CBOC)

Burrowing Owl Survey Protocol and Mitigation Guidelines (CBOC 1993), and the 1995 California Department of Fish and Game (CDFW) Staff Report on Burrowing Owl Mitigation (CDFW 1995). A methodical pedestrian survey for owl burrows was conducted by walking through areas of suitable habitat within the study area, including man-made structures.

The locations of all potential owl burrows and sign were recorded and mapped using handheld global positioning devices and aerial imagery. Incidental observations of other avian species, plants and other wildlife were also noted. The presence of each observed wildlife species was based on direct observation of individual(s), sign, and/or vocalization. CBOC survey protocols and POWER's full methodology and results are described in the burrowing owl survey report (POWER 2011). As part of ABPP development, these data were used to inform agency coordination, identify initial voluntary mitigation and in the preparation of the Western Burrowing Owl Mitigation and Monitoring Plan (Appendix A).

Golden eagle: A review of existing information, including CNDDB records and previous studies, shows that Golden eagle active nests are not located within 10 miles of the Project site. Existing data and reports from the Blythe Solar Power Project (AECOM 2010) also indicated no Golden eagles within 10 miles of their project site. Based on the existing records and the reconnaissance survey, no further survey is proposed for the Project. If changes are observed, revisions to this ABPP will be incorporated.

Bats: A reconnaissance survey was conducted to help determine the potential for bat species to occur within the Project area. The Project site is in an area dominated by either agriculture or sparse desert scrub over lying deep Pleistocene-aged alluvium with little topographic relief. Foraging habitat is limited and roosting habitat is absent. Based on the results of the reconnaissance survey and lack of suitable habitat, no focused surveys are recommended. Bats may use the Project site in an incidental fashion as seasonal transients or migrants.

5.0 OPERATIONAL BIRD AND BAT MONITORING AND REPORTING

The primary objective of the operational (i.e., post-construction) avian and bat monitoring is to monitor undesirable nest construction on Project equipment and estimate the annual number of avian and bat fatalities attributable to the Project. These data will provide a measure of plan efficacy and inform adaptive management. Because of the presumed low risk potential for the site, this ABPP does not direct the assignment of a full-time operational Project biologist. BMSP will implement a wildlife reporting system to document incidentally found bird and bat fatalities and to monitor for significant fatality events. The site manager will lead the program. Site personnel will be trained to follow the wildlife reporting system procedures and complete the wildlife reporting form. Post-construction monitoring will be conducted by facility operators and field engineers during normally scheduled activities.

Personnel will complete searches of solar arrays within the Project development area as part of normal maintenance and line patrols of the gen-tie line. Searches will consist of walking around solar generation structures to identify carcasses of birds or bats or nesting materials on equipment. Bird nest monitoring and reporting forms for gen-tie line and the solar array are provided in Appendix D. When a dead or injured bird or bat is found, a wildlife incident reporting form will be filled out (Appendix E) and turned in to the site manager. Personnel without the appropriate federal and state permits will not move or transport dead or injured birds. Bird carcasses (except for raptors) can be buried on site but not transported without a permit.

Injured birds and bats will not be handled by personnel. If an injured raptor or sensitive species is found, the CDFW will be contacted to determine whether a rehabilitator should come pick up the injured animal.

Bird nests constructed on site equipment can lower efficiency, create operational problems, and lead to down time (outages) and safety issues. Because the solar facilities and gen-tie line provide vertical

structure over a fairly large area, the probability exists for birds to occasionally attempt nest construction on equipment. Workers should be diligent in observing attempts by bird to construct nests on equipment during the breeding season. BMSP personnel are not authorized to remove active nests or destroy young birds at this time. In the event that an active nest is observed on equipment, BMSP personnel will contact CDFW and USFWS for direction. Note that inactive nests of all non-raptors can be removed outside the breeding season without a depredation permit.

Each year, a concise annual report will be provided to USFWS, briefly summarizing each year's wildlife reporting system findings. If a significant fatality event is discovered (e.g., any eagle fatality, more than three raptors in a single event, more than ten birds or bats in a single event) or nesting attempts reach a nuisance level, the site manager will contact environmental contractors (if any), and the USFWS as soon as possible for coordination.

6.0 POST-CONSTRUCTION MITIGATION AND ADAPTIVE MANAGEMENT

6.1 Adaptive Management Process

Adaptive management is an iterative process in which impact minimization and mitigation measures are continuously reevaluated in order to improve them. As action is taken the results are monitored and future actions are modified accordingly. This is an especially useful strategy for managing resources where uncertainty surrounds appropriate management actions and there consequences. Because utility-scale solar energy development is a relatively new and rapidly expanding industry, its effect on bird and bat populations is uncertain. There is also uncertainty surrounding current fatality predictions as well as which measures are most effective at reducing fatalities and mitigating impacts to bird and bat populations. As more data is gathered at facilities and new strategies are tested, these uncertainties will be reduced and agency guidance will be refined.

The Proponents are committed to incorporating adaptive management principles into its ABPP. To facilitate the adaptive management process, BMSP will submit timely reports to USFWS and CDFW summarizing results of operational monitoring and the wildlife reporting system. Fatality thresholds will be used to determine when adaptation is required. When a threshold is surpassed, BMSP will evaluate the species, timing, and locations of fatalities and consult with USFWS to determine if additional avoidance or minimization measures are appropriate. If thresholds are surpassed again, compensatory plan measures will be triggered, along with additional avoidance and minimization measures. As part of the adaptive management process, the thresholds may be adjusted if new information is gained regarding the number of solar facility fatalities necessary to significantly impact bird or bat population trends and the extent to which solar facility fatalities are compensated by density-dependent demographic factors (e.g., lower natural mortality or higher productivity). An initial set of avoidance and minimization, are proposed to be implemented if thresholds are surpassed; measures may be replaced with measures of similar scope and cost if more effective measures become available and are deemed appropriate to the specific circumstances surrounding the fatality patterns identified at the Project site.

6.2 Avian and Bat Fatality Thresholds

The identification of fatality thresholds to trigger mitigation is an unavoidably arbitrary process developed through agency coordination and mutual agreement. Most solar energy facilities are unlikely to significantly impact populations of most species. But population effects may be difficult to identify, particularly for some species, such as bats, for which populations are not well understood. With continued rapid growth of renewable generation facilities, cumulative impacts may become an important concern. It is prudent to mitigate bird and bat fatalities in situations where unusually high numbers of fatalities occur.

Based on a review of western renewable generation facilities (including wind farms) the following initial thresholds have been developed. During formal post-construction monitoring at BMSP, fatality estimates, expressed as fatalities/MW/year, will be reported in annual reports. The thresholds that will trigger adaptation and mitigation measures are as follows:

1) more than four total native bird fatalities/MW/year,
2) more than 0.3 raptor fatalities/MW/year,
3) more than one golden eagles across entire project,
4) more than one active raptor nest constructed on generating equipment,
5) more than three bat fatalities/MW/year, or
6) more than ten active non-raptor nests requiring removal

6.3 Additional Risk Reduction Measures and Adaptive Management

If events are demonstrated to exceed any of the identified thresholds, and upon consultation with USFWS, adaptation may be triggered. Adaptation will include investigation, evaluation of the factors associated with the fatalities, exploration of engineering solutions, consideration of available avoidance and minimization measures, and likely implementation of one or more appropriate avoidance and minimization measure. If the same threshold is surpassed again, additional plan measures may be triggered.

It is important to note that the implementation of clean solar energy generation is in and of itself a difficult to quantify but nonetheless compensatory mitigation measure. ABPPs are designed to address proximate impacts to wildlife but ultimate project benefits to the ecosystem are part of the Project's purpose. When solar energy substitutes for fossil fuel energy sources, the result is a net decrease in toxic air emissions. In turn, the decrease of pollutant emissions reduces many broad scale harmful effects to wildlife. The Proponents are also committed to reducing direct impacts to local wildlife populations by implementing appropriate avoidance, minimization, and mitigation measures.

In the event fatality thresholds are surpassed, additional compensatory measures will be implemented by BMSP as discussed below.

6.3.1 Additional Risk Reduction Measures

In the event that the above thresholds are met, the following adaptive measures will be implemented to reduce impacts. This ABPP will be updated to reflect the additional measures and monitoring for efficacy will be conducted for three years following implementation.

- Installation of remedial avian protection equipment (bird flight diverters or perch preventers or dissuaders) in problem areas. Provide annual budget for such equipment
- Manage, monitor and remove potential bird nesting materials near solar arrays
- Modification of existing equipment to prevent nesting, perching or other undesired bird access
- Obtain necessary Federal and State permits for problem nest removal
- Formal, systematic fatality monitoring along the gen-tie line or within problem areas at the array facilities
- Employ a dedicated and qualified site biological monitor either full-time or seasonally, depending on the specific issue identified

1.0 INTRODUCTION

POWER Engineers, Inc. (POWER) prepared this western burrowing owl (*Athene cunicularia hypugaea*) mitigation monitoring plan for Renewable Resources Group, LLC (RRG) as part of the proposed Blythe Mesa Solar Project (BMSP, Project). The western burrowing owl (burrowing owl) is a Bureau of Land Management (BLM) Sensitive species, California Department of Fish and Game (CDFG) Species of Special Concern, and is protected under the federal Migratory Bird Treaty Act (MBTA). Reconnaissance and protocol surveys were conducted to determine if the proposed Project could affect the protected western burrowing owl. The Study Area for the purposes of this document is delineated on Figure 2 and includes a 125-foot proposed right-of-way along the transmission line and a 500-foot (150-meter) wide buffer around the solar facility site. The Study Area supports a relatively small population of burrowing owl, and supports burrowing owl that may occupy habitat outside of the Study Area limits. The July 2011 protocol surveys found eight individual burrowing owls present within the study area that may be directly or indirectly affected by the Project (POWER 2011).

The study area is located in eastern Riverside County, California near the City of Blythe. The proposed Project consists of construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure to provide site access and connection to the statewide electricity transmission grid. The Project is proposed to be located on approximately 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587 for the solar facility and 73 acres for the 230 kilovolt (kV) transmission line interconnect. POWER conducted the surveys throughout the Study Area.

This Burrowing Owl Monitoring and Mitigation Plan (Plan) has been developed to describe monitoring, reporting, and management of the burrowing owl during the construction, operation and maintenance (O&M), and decommissioning of the proposed Project, as required by the BLM, CDFG, and County of Riverside. It has been prepared following the 2012 CDFG Staff Report on Burrowing Owl Mitigation (CDFG 2012), and describes a multi-tiered approach to prevent or reduce impacts during construction and operation of the Project. While avoidance measures often focus on protecting animals by making adjustments to construction activities near occupied burrows, moving individuals out of harm's way to off-site locations is sometimes the best alternative. Based on the survey results, there is a small population of approximately eight individuals that was identified within the study area (POWER 2011). It may be necessary to move individuals out of harm's way when they are within the portion of the Project area scheduled for construction. This Plan is designed to provide an effective but feasible strategy that would avoid, minimize, and mitigate potential Project impacts to the burrowing owl.

1.1 Project Description

The Blythe Mesa Solar Project is proposing to construct a 485 MW solar PV electrical generating facility and 8.4-mile gen-tie line that would occupy a total of 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587acres for the solar facility component and 73 acres for the 230 kV gen-tie line. The power produced by the Project would be conveyed to the local power grid via interconnection to the Southern California Edison (SCE) Colorado River Substation, an approved new substation located south of Interstate 10 (I-10) and approximately 5 miles west of the Project site.

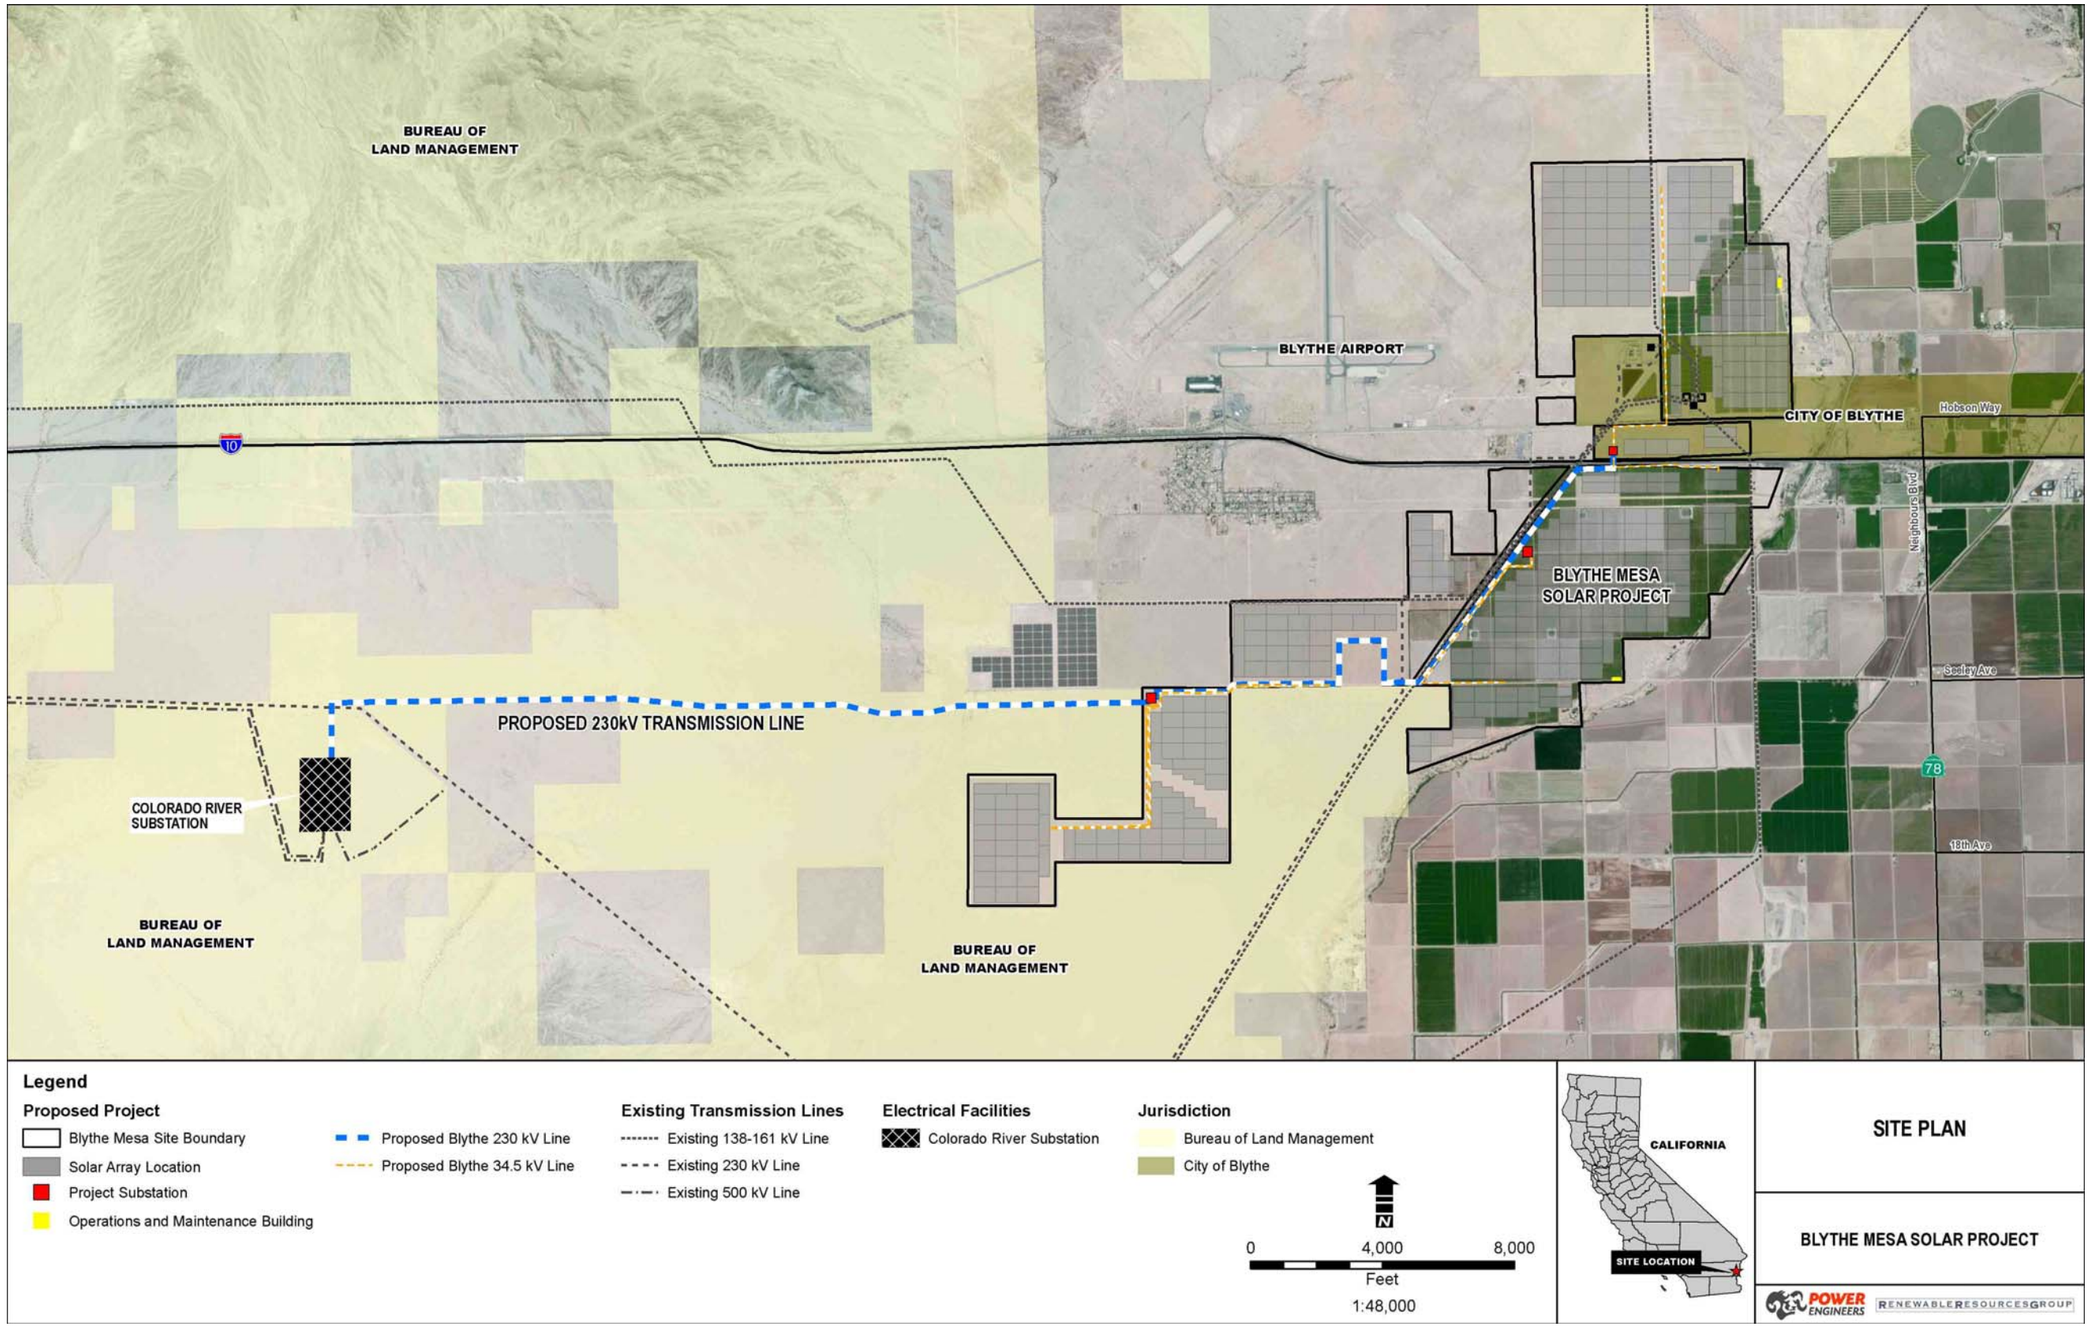
The proposed project site plan consists of the following components (Figure 1):

- Solar array field utilizing single axis solar PV trackers
- System of interior collection power lines located between inverters and substations
- Three on-site substations (each approximately 300 feet long by 300 feet wide)
- Two O&M buildings (approximately 3,500 square feet each)
- Two primary off-site access roads and several interior access roads

- 4.8 miles of 230 kV double-circuit transmission line between the solar facility and Colorado River Substation, which would be within a 125-foot-wide right-of-way

1.2 Regional Setting

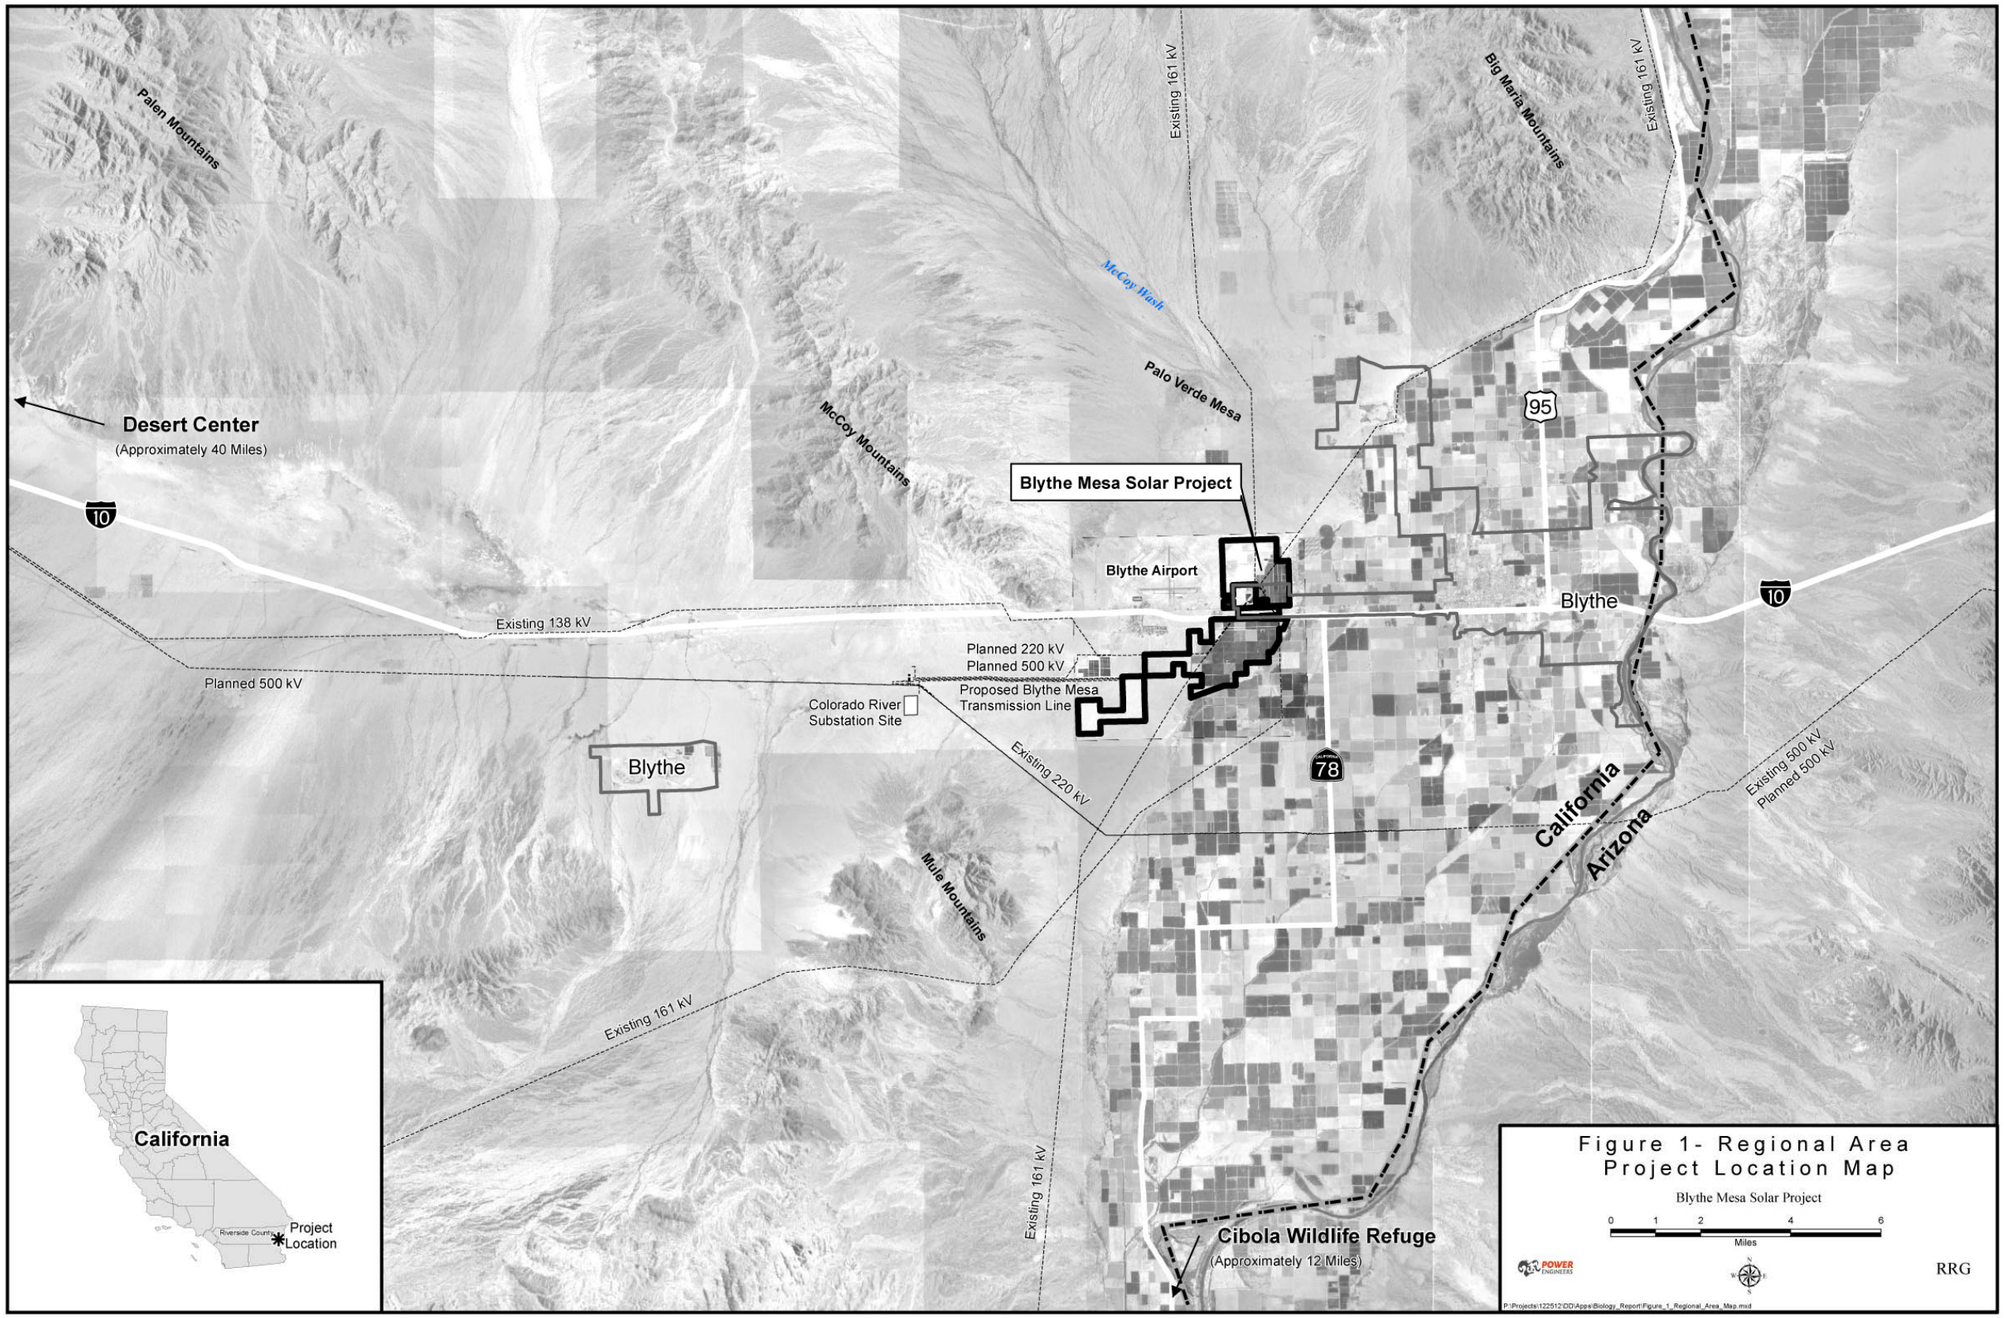
The 3,660-acre site is five miles west of Blythe and consists mostly of agricultural land, including both irrigated and non-irrigated crops. The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5' U.S. Geological Survey (USGS) Topographic Quadrangles (see Figure 2). The Project is located on:



- Sections 11 and 12 of Township 7 South, Range 21 East
- Sections 3, 4, 5, 6, 8, 9 of Township 7S, South, Range 22 East
- Sections 27, 28, 29, 32, 33, 34 of Township 6 South, Range 22 East, of the San Bernardino Base Meridian

State Highway 10 bisects the Project area, which is bounded on the north and south by undeveloped desert, on the east by agricultural lands, and on the west by the Blythe City Airport and undeveloped desert.

The Project area is located on the western mesa of the Palo Verde Valley. The valley is a portion of the Colorado River floodplain. The Project area is on Palo Verde Mesa and is situated in the greater Sonoran Desert. The topography is relatively flat and slopes toward the southeast; elevations range from 260 to 400 feet above mean sea level (AMSL). The Project area is near the Big Maria Mountains on the northwest, the McCoy Mountains on the west, the Mule Mountains on the southwest, and the Colorado River on the east. These mountain ranges, trending northwest to southeast, create a natural barrier between the Colorado River and the greater Colorado Desert.



The subtropical climate of the Colorado Desert is currently characterized by dry, mild winters averaging 45 degrees Fahrenheit (˚F) and dry, hot summers that average 104˚F. Summer highs are known to reach up to 120˚F. Precipitation ranges between two and ten inches per year, with most of the precipitation occurring between November and March. Although rainfall occurs primarily in the winter months, the region is periodically influenced by tropical weather conditions, including sudden monsoonal summer storms, which typically occur from July to later September.

FIGURE 2. REGIONAL AREA PROJECT LOCATION MAP

THIS PAGE INTENTIONALLY LEFT BLANK

1.3 Local Setting and Surrounding Land Uses

The Study Area encompasses land ranging from 260 to 400 feet AMSL. The topography on site is generally flat with gentle relief formed by desert alluvial flow patterns.

The Study Area consists primarily of agricultural lands and desert scrub. Along the four-mile transmission line route and eastern and southern ends of the Project limits there are discrete areas of disturbed native creosote scrub and disturbed stabilized dune and blow sand habitats. Table 1 presents the estimated acreage observed for each habitat type within the study area. This data does not represent the actual proposed Project disturbance footprint for the solar array areas, transmission lines, substations, and facility buildings and roads.

Table 1. Vegetation Communities and Cover Types (Acres)

Vegetation Communities and Other Cover Types	Acreage on the Solar Facility Site Project Boundary*	Acreage on the Proposed Gen-tie Line**
Bajada	18.1	0.0
Creosote Bush Scrub	41.9	278.8
Desert Riparian Woodland Wash	0.0	22.9
Disturbed Creosote Scrub	220.1	0.0
Disturbed/Ruderal	31.2	0.5
Fallow Agriculture	249.7	0.0
Irrigated Alfalfa	404	0.0
Irrigation Pond	17.2	0.0
Mixed – Drip-irrigated Jojoba and Disturbed Creosote Scrub	347	0.0
Non-irrigated Wheat	1088.2	0.0
Orchard	1188.4	0.0
Total Acreage	3605.8 acres	302.1 acres

*The acreage was calculated using GIS data and totals 3,605 acres; however, the County calculates the same area as 3,587 acres.
**A 250-foot buffer was placed on either side of the gen-tie centerline to account for potential indirect and direct impacts to biological resources.

As listed above, approximately 70% of the solar facility area is actively cultivated agricultural land, 24% is previously disturbed by agricultural or military activities, and 6% remains undisturbed. Agricultural land use within the solar facility site includes drip-irrigated citrus orchards, flood-irrigated alfalfa, non-irrigated winter wheat, abandoned jojoba orchards, and fallow fields. The gen-tie line corridors would pass through BLM lands and other private lands mainly comprising desert scrub habitat and disturbed lands associated with existing infrastructure. Several utility lines and maintenance roads run through or parallel the gen-tie line corridors. Additionally, the Project area has been previously disturbed by off-road vehicle use, trash dumping, and historic use for military training during World War II. The Project area borders or is in the vicinity of Nicholls Warm Springs/Mesa Verde, an existing solar facility, Blythe Airport, the 520 MW natural gas-fired Blythe Energy Center, electrical substations, electrical transmission lines, I-10, and other paved and dirt roads. The Project area is bound on the east by agricultural land use that extends to the Colorado River.

2.0 WESTERN BURROWING OWL OVERVIEW

This section provides an overview of the listing status, ecology, local distribution, and survey results of the western burrowing owl.

2.1.1 Burrowing Owl Survey Results

Protocol surveys were conducted in 2011 to document the presence or absence of burrowing owl within the Project area and, if present, their abundance and the amount of suitable habitat. The following is a summary of the survey analysis and results (POWER 2011)

Records Search

A nine-quad search of the California Natural Diversity Database (CNDDB) (CNDDB 2011a), including USGS quadrangles McCoy Peak, McCoy Wash, Blythe NE, Roosevelt Mine, Ripley, Blythe, Thumb Peak, Palo Verde, and Mule Wash, identified 46 occurrences of burrowing owls in the Blythe area, with two occurrences on the Project site. In addition to the CNDDB records search, recent surveys and reports for similar projects near the Project area were also reviewed. There are several solar projects being planned or in the permitting process in the vicinity, and some have completed burrowing owl surveys and results are available (Appendix C)

Table 2. Adjacent Project Survey Information

Species	Project	Species Detected	BMSP Survey Area Overlap
Burrowing Owl	Blythe Solar Power Project	Yes, two within solar site, four in transmission line and multiple sign. Not determined how sign was confirmed.	Overlaps with BMSP transmission line and Colorado River Substation (CRS) survey areas.
	Genesis Solar Energy Project	Yes, three individuals detected around the generation tie line and one burrow around the main site.	No overlap
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Burrow sites detected along project segment that encompasses Colorado River Substation, but specific locations not mapped.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, burrowing owls detected along southern telecom route. Three owls detected just east of Colorado River Substation.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.

Survey Results

A systematic pedestrian assessment of the study area to determine the habitat suitability for burrowing owls was conducted on the 5th and 6th of May 2011. During the habitat assessment survey, biologists determined that the Project area contained suitable habitat conditions to support burrowing owls. Of the 3,679 acres in the Study Area, approximately 1,970 acres (54%) of suitable burrowing owl nesting and foraging habitat were identified (Figure 2). Suitable habitat consisted of both fallow and active agricultural fields, irrigation ponds and canals, and creosote bush scrub. Suitable habitat also occurred

along the edges of orchards. The remaining 1,703 acres consisted of orchards and alfalfa fields. Orchards within the Project area did not contain suitable habitat; burrowing owls prefer open areas and do not inhabit areas with dense vegetation (Klute et al. 2003). Alfalfa fields provide suitable forage areas for burrowing owls, but heavy and frequent disturbance of the fields by disking and harvesting decreases burrow availability. Burrows can occur along the edges of agricultural fields, orchards, and road banks; all road banks, field edges, and irrigation ditches along the agricultural areas throughout the Project site were surveyed. Six irrigation ponds located in the orchard area and irrigation channels throughout the agricultural area and to the east of the Project limits provide accessible fresh water for wildlife.

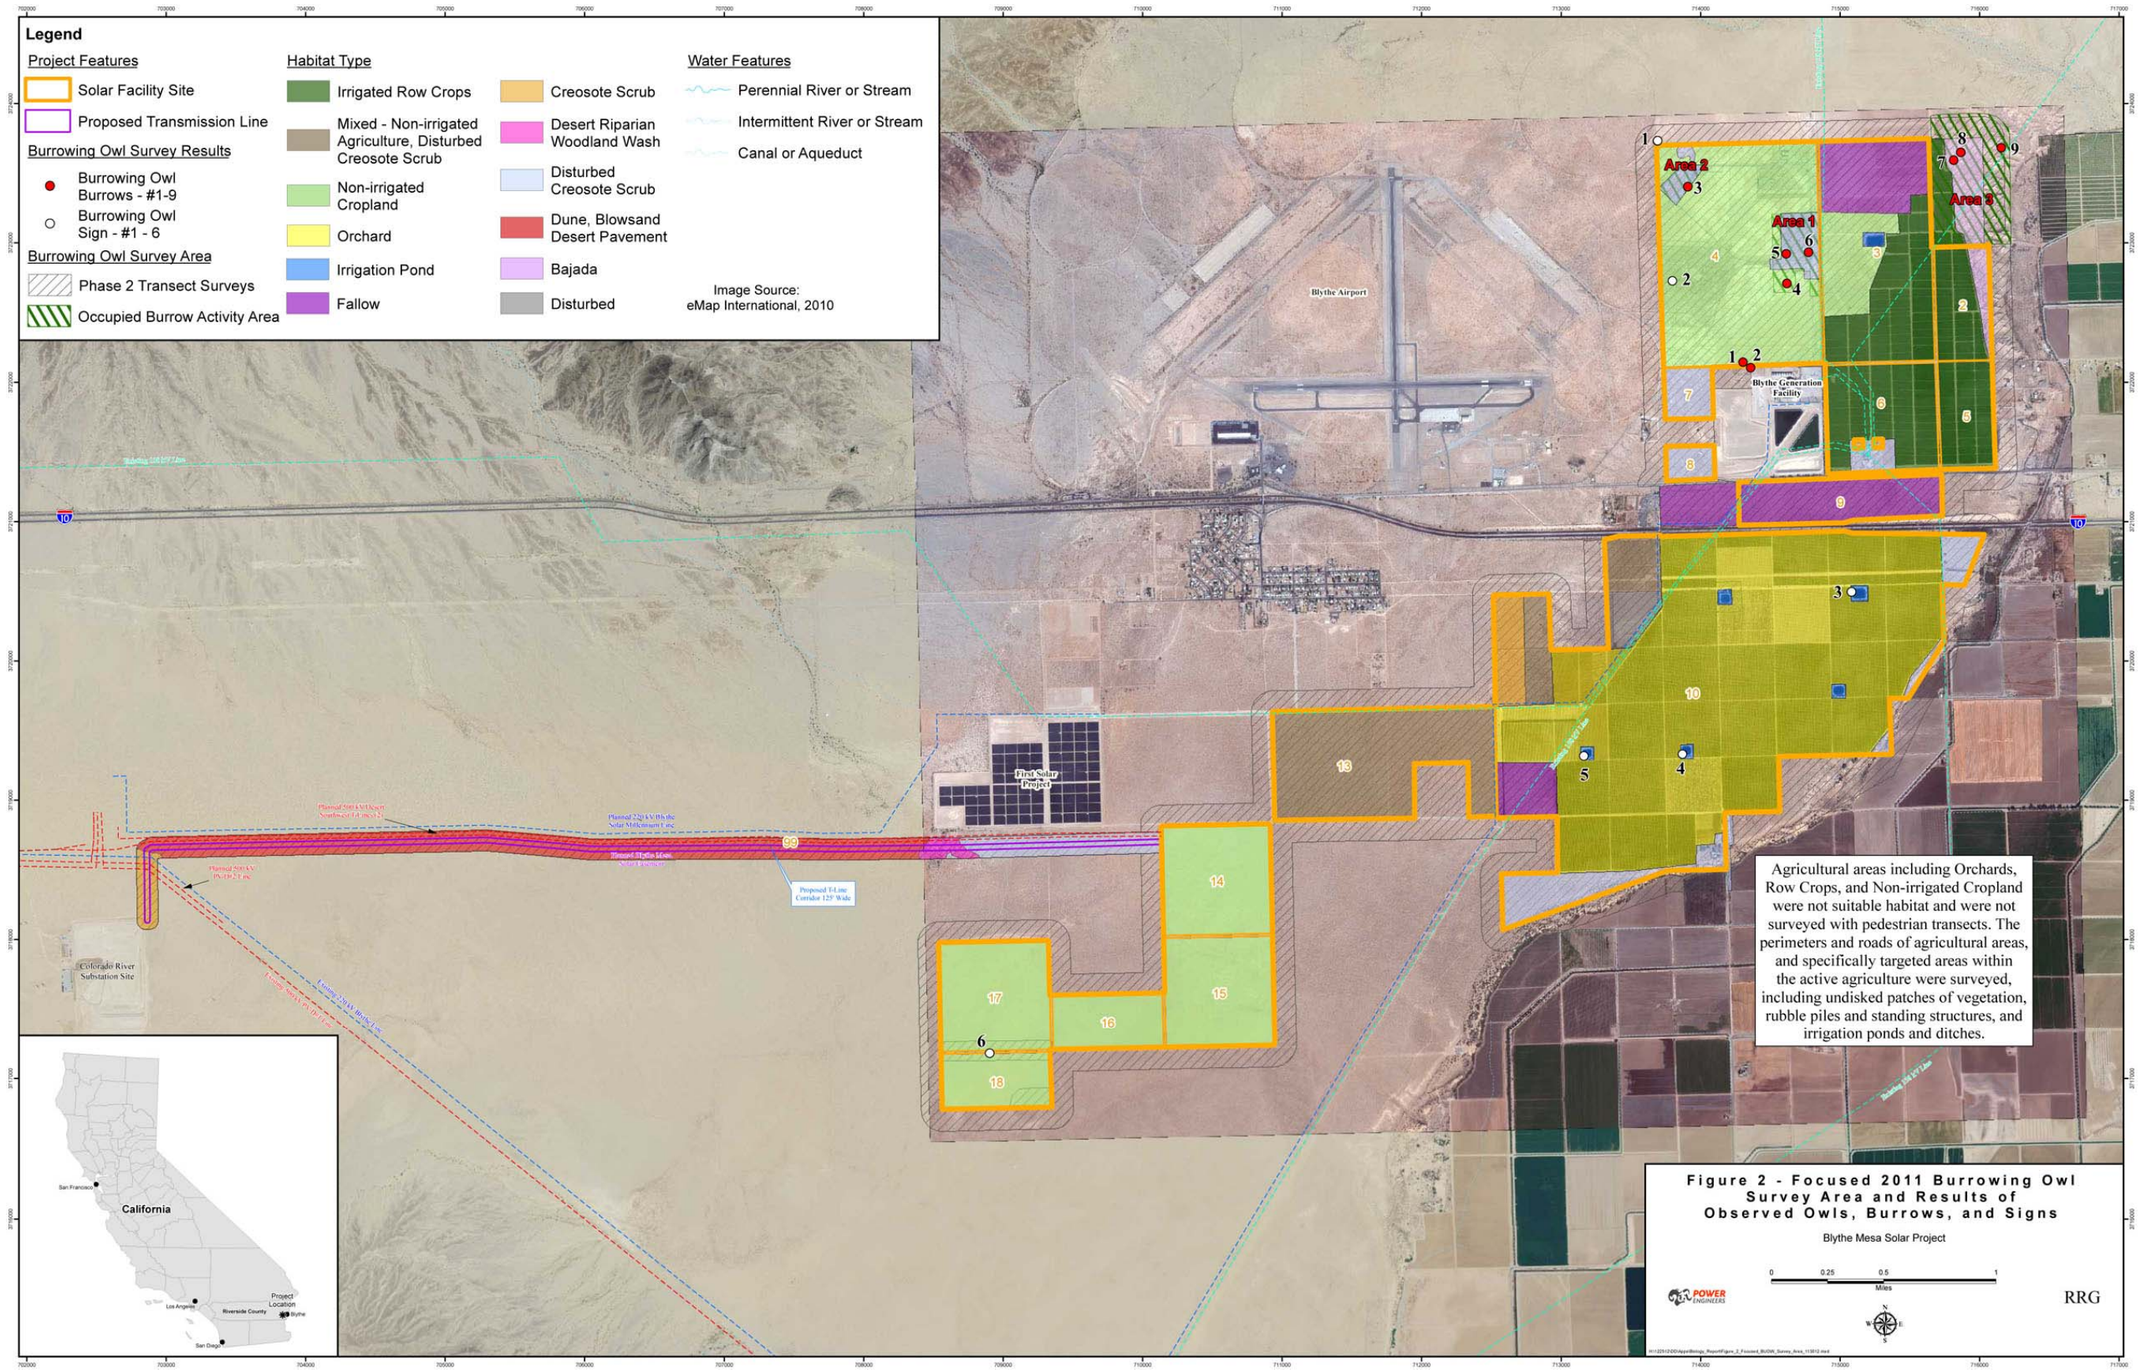
Protocol surveys were started on May 6 and extended through July 23, 2011. Survey methods were derived from generally accepted professional standards, the 1993 California Burrowing Owl Consortium (CBOC) Burrowing Owl Survey Protocol and Mitigation Guidelines (CBOC 1993), and the 1995 CDFG Staff Report on Burrowing Owl Mitigation (CDFG 1995). In summary, a methodical pedestrian survey for owl burrows was conducted by walking through areas of suitable habitat within the study area, including man-made structures. The field data from the protocol surveys identified the presence of six burrowing owls during the May survey and eight owls during the July surveys, and an additional two owls were observed outside the Project site but within the Survey Area. Nine suitable burrows or burrow complexes were observed in the northern portion of the site (Figure 2). No suitable burrows were observed in the southern portion of the site. Soil conditions for Project parcels 4 and 13 through 18 and the transmission corridor were very sandy and unstable. Sandy soil would not support burrowing owls; however, burrowing owls are opportunistic and could use other potential burrows in the area that may be found in the berms of roads or concrete piles. Burrowing owl sign (white wash, pellets, feathers) was observed in five locations in the southern region of the Project area. Burrows observed in the southern half of the site belonged to either kit fox (*Vulpes macrotis*) or kangaroo rat (*Dipodomys* sp.). No burrowing owl sign was observed near the kit fox burrows. Several of the kit fox burrows were recent and active kit fox sign was documented; however, most of the burrows were old and collapsed and would not support burrowing owl because the instability of the soil.

Burrowing owl activity and use was determined during the subsequent surveys (July 14 through 19 and 21 through 23). Burrows were monitored at sunrise or sunset on different days to ensure a complete activity period was evaluated for each observed bird. Burrows #1 and #2 were determined not active during the initial monitoring phase and were therefore not included in further monitoring. The other active burrows within the northern end of the Project site were divided into three burrowing owl monitoring sites. Please refer to Figure 2 for the location of Areas 1, 2, and 3.

Area 1 supported four burrowing owls. The four burrowing owls were observed flying in and out of three separate concrete/brick-lined cylindrical, man-made structures (Burrows #4, 5, and 6), which have concrete collars above ground level and are open below ground level to a depth of approximately 4 feet. In Area 1, Burrow #4 contained the greatest number of observed sign, including pellets, prey detritus, feathers, and white wash. Burrows #5 and #6 also featured significant amounts of pellets, detritus, white wash, and feathers. Biologists were unable to determine if the owls were two separate pairs or one pair with two juveniles. Burrowing owls at Area 1 consistently exhibited social and foraging behavior. Several perch sites were favored in this area, including a metal rod with a rounded top, a fence post, a large pile of cleared vegetation and, most frequently, the edges of the concrete wells. Area 1 consisted of approximately 5 acres of disturbed creosote bush scrub dominated by creosote bush and bur sage; concrete rubble piles from old demolished barracks were scattered throughout the creosote bush scrub. Area 1 was bound on the south, west and north by recently tilled, non-irrigated wheat fields that have been farmed for approximately one year. This field is bound to the north by open space comprising creosote scrub habitat, and to the west by disturbed creosote scrub habitat within the area of the former military base and current Blythe Airport.

In Area 2, two burrowing owls occupied a single burrow (Burrow #3) located in a concrete rubble pile. The two owls were observed consistently during morning and evening hours perched on top of the rubble pile. Burrowing owl tracks were identified around and into the rubble pile, with feathers and pellets near a small burrow entrance beneath the rubble. Sex and age of the two burrowing owls observed during the surveys were not established. The burrowing owls occupying Area 2 were easily distressed and would flush and call to one another whenever biologists entered the vicinity. Area 2 consisted of approximately 2 acres of disturbed creosote bush scrub dominated by creosote bush and bur sage. Concrete rubble piles and two concrete foundations were scattered throughout the creosote bush scrub. Area 2 was surrounded to the south, east, and north by recently tilled, non-irrigated wheat fields and disturbed creosote bush scrub to the west.

Area 3 is outside the Project footprint but within the buffer Study Area. In Area 3, two burrowing owls occupied a burrow complex within a native Bajada area. One burrow appeared to be a former canid burrow due to its size, shape, and location in an area of naturally formed earth mounds. Biologists identified three separate burrowing complexes on the earthen mounds within an approximately 10-acre zone. Each burrow complex contained several burrows with recent sign, including white wash, feathers, tracks, and pellets. The two burrowing owls were typically perched on top of earthen mounds when the biologists accessed the area. Without additional harassment, biologists could not determine if the two burrowing owls were nesting.



2.1.2 Burrowing Owl Impacts

Western Burrowing Owl

Direct Impacts: Based on spring 2011 protocol survey data, construction activities, including the installation of the solar facility, would permanently impact western burrowing owl by removing accessible foraging and nesting habitat for at least six to eight burrowing owls that were detected within the solar array area. No burrowing owl breeding was documented during 2011 surveys; however, most of the proposed solar facility site contains suitable burrowing owl habitat. It is possible that the solar facility site may be used more during migration or other seasonal movements or during winter. If the solar facility site is used for breeding, it is possible that nests or eggs may be lost as a result of construction activities near burrows. Temporary direct impacts to burrowing owl would also result from an increase in vehicle traffic while the Project is under construction and, consequently, an increase in vehicular strikes of burrowing owl. Project noise, vibration, or visual disturbance may also affect burrowing owls.

Indirect Impacts: The Project may result in increased common raven and raptor predation on burrowing owls as associated with the addition of new elevated perching sites, including the gen-tie structures, perimeter fencing, and gen-tie lines. Other native or introduced animals that may be drawn to human activity and subsequently prey upon burrowing owls include coyotes, cats, or dogs (Bates 2006). Additionally, temporarily ponded water from construction (e.g., dust suppression during construction) and garbage from increased human presence might attract common ravens. These indirect impacts would potentially impact burrowing owls, burrowing owl breeding habitat, or adjacent foraging habitat.

FIGURE 3. FOCUSED BURROWING OWL SURVEY AREA, OBSERVED OWLS, BURROWS AND SIGN

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 WESTERN BURROWING OWL AVOIDANCE MEASURES

The primary purpose of this plan is to avoid, minimize, and mitigate for significant Project impacts to burrowing owls. The following program will be implemented to specifically address impacts to the burrowing owls. Refer to Appendix B for additional best management practices that will also minimize potential impacts to the burrowing owl.

3.1 Monitoring and Reporting Program

3.1.1 Pre-construction Burrowing Owl Surveys

Pre-construction surveys will be conducted throughout the Study Area for burrowing owls, possible burrows, and sign of owls (e.g., pellets, feathers, white wash). The purpose of the pre-construction surveys will be to locate and identify active burrowing owl burrows, estimate the current number of burrowing owl individuals or pairs on site, and determine if the burrowing owls observed on site are considered breeding pairs or migrating transient birds within the Project area. Surveyors will walk line transects spaced 7 meters to 20 meters apart, adjusting for vegetation height and density. All potential burrows, sign, or calls will be documented. Appendix D of the CDFG 2012 survey guidelines will be implemented and are summarized below.

3.1.2 Biological Monitors

The résumé of the proposed biologists will be provided to the County of Riverside, CDFG, and BLM for concurrence before conducting pre-construction surveys or monitoring. The approved Biologist will be on-site to conduct pre-construction surveys and monitor ground disturbance, grading, and construction activities that take place in burrowing owl habitat near burrowing owls and/or burrowing owl burrows. This will help prevent or minimize harm or injury to the burrowing owl.

The approved biologist shall be responsible for documenting the results of the surveys and the ongoing monitoring and will provide a copy of the monitoring reports for impact areas to the respective agencies (e.g., on BLM lands, documentation will be provided to the BLM Biologist). The approved Biologist will be responsible for flagging, staking, and/or other marking appropriate setback distances from active burrows. If destruction of an occupied burrow is unavoidable, the owl(s) will be passively relocated. The approved Biologist will report injuries and mortalities within 24 hours to the Construction Contractor and together they will inform the respective agencies.

The approved Biologist will oversee the installation of the artificial burrows and passive relocation activity. They will also monitor the burrowing owl post-relocation activity and submit annual monitoring reports to the BLM and CDFG.

3.2 Worker's Education Awareness Program

An approved biologist(s) shall conduct a detailed biological Worker Environmental Awareness Program (WEAP) for all Project personnel before any construction or activities within the Project footprint. The WEAP shall include discussions of Project permits and brief summaries of their conditions; discussions of agency involvement, their applicable sensitivity measures, and relevant environmental protection legislation (e.g., the Endangered Species Act, the Migratory Bird Treaty Act); descriptions of the burrowing owl that could exist in the Project area, along with their locations, legal status, and protections; and a review of all measures to be implemented for avoidance of the burrowing owl. Construction workers will be encouraged to alert the biologist on site if they detect a burrowing owl.

3.3 Avoidance

Should any of the pre-construction surveys yield positive results for the presence of burrowing owl or active burrows within the Project area, the approved Biologist will coordinate with the Construction Contractor to implement avoidance and set-back distances.

Occupied burrows will not be disturbed during the breeding season (February 1 through August 31) unless an approved biologist verifies, through non-invasive methods, that: 1) the birds have not begun egg-laying and incubation; and 2) that juveniles from the occupied burrow are foraging independently and are capable of independent survival. The following table describes the CDFG 2012 guidelines for activities around occupied burrowing owl nests and recommended buffers based on low, medium, and high disturbance activities, respectively.

Table 3. CDFG Burrowing Owl Buffer Recommendations

Location	Time of Year	Level of Disturbance		
		Low	*Med*	*High*
Nesting sites	April 1 to Aug 15	200 m*	500 m	500 m
Nesting sites	Aug 16 to Oct 15	200 m	200 m	500 m
Nesting sites	Oct 16 to Mar 31	50 m	100 m	500 m

*meters (m)

The approved Biologist will coordinate with the Construction Contractor to determine the level of disturbance and buffer distance needed. As topography and site conditions allow, setback distances can be reduced. Where appropriate, the setback distances can be reduced by screening burrows (i.e., installing hay bales or another type of material to create a visual and auditory barrier between construction and the burrow) as a means of minimizing disturbance to owls. If hay bales are used, they shall be certified as weed-free in accordance with the Project's weed control management plan. In addition, the approved Biologist will monitor the set-back distances to ensure that the applied distance is an effective buffer. Effective buffers are those that minimize indirect impacts on the burrowing owl by providing a distance between the burrow and construction activities.

3.4 Excavation of Inactive Burrows

If suitable burrows are observed and documented during the pre-construction surveys within the Project footprint and determined to be inactive, these burrows will be excavated and filled in under the supervision of the approved Biologist(s) prior to clearing and grading. Excavation (by hand) of inactive but potentially suitable burrows will help deter burrowing owls from occupying burrows within the active construction areas. Refer to Section 3.6 below for details on the excavation protocols for the burrowing owl.

3.5 Passive Relocation From the Project Area

3.5.1 Artificial Burrow Installation in Relocation Area

To compensate for impacts to the burrowing owls in activity areas on the northern part of the Project, 146 acres of habitat have been identified adjacent to the Project area to the northeast (Figure 3). Surveys have not been conducted on all adjacent lands; however, they are within the same habitat that supports the burrowing owls currently within the Project area. The 2012 CDFG guidelines will be followed to identify the location within the 146 acres to install the artificial burrows. Installation of the artificial burrows shall occur after identification of the specific relocation sites and prior to ground disturbance of heavy equipment staging. The results of the proposed relocation, including photographs and details of the vegetation and topography where the artificial burrows are proposed, will be provided to the CDFG and County of Riverside for review and approval.

Design of the artificial burrows shall be consistent with the CDFG guidelines (CDFG 2012) and developed in consultation with CDFG. A representative design schematic for an artificial burrow is provided as Attachment A.

Five locations in the southern portion of the Project (south of Interstate 10) contained burrowing owl sign (white wash, pellets, feathers). However, no burrowing owl, its sign, or suitable burrows were observed in this area of suitable habitat. In the event that active burrowing owl burrows are located in the southern portion of the solar facility site during pre-construction surveys, additional potential mitigation land for burrowing owls was identified within and outside the Project boundary and is illustrated in Figure 3.

3.5.2 Passive Relocation and Exclusion Methodology

Passive relocation is considered the preferred option to trapping (CBOC 1993), and the CDFG will not authorize the capture and relocation of burrowing owls except in the context of scientific research (CDFG 2012). During the non-breeding season, owls shall be given a minimum of three weeks to become familiar with the new artificial burrows, after which eviction of owls within the Project area shall begin. A time period of at least one week is recommended to allow the owls to be passively moved and acclimate to alternate burrows (CBOC 1993). As recommended by CDFG 2012 guidelines and described by Truilo (1995) and Johnson et al. (2010), a one-way door shall be used to facilitate passive relocation of owls. The one-way door shall be left in place for 48 hours to ensure burrowing owls have left the burrow before excavation (CDFG 2012)

The following exclusion methodology shall be implemented to prevent burrowing owls from reestablishing themselves once relocated. Following installation of the one-way doors, intensive monitoring of the burrow will be conducted by the approved Biologists to count the number of departing birds. All evicted burrowing owls will be monitored daily from dawn until dusk to determine their post-eviction fate until one of the following events occurs: 1) the burrowing owl is observed to reside in the artificial burrow for at least 10 consecutive days; 2) the owl is consumed by a predator or otherwise dies, and its death is documented and reported to CDFG, USFWS, and the County of Riverside; or 3) the monitoring team is unable to locate the owl in the vicinity of the Project area for 10 consecutive days, in which case the monitoring team will report the owl as “disappeared” in the final post-eviction report sent to the three agencies. The monitoring schedule may be adjusted upon review and approval by CDFG and the County of Riverside.

Burrows shall be excavated after being determined vacant by use of a down-hole camera, monitoring, and the use of one-way doors. Excluded burrows shall be monitored daily for one week to confirm no additional burrowing owls use them before excavation. After burrows are confirmed to no longer be in use, the burrow shall be excavated using hand tools and refilled to prevent reoccupations. Sections of flexible plastic pipe or burlap bag shall be inserted into the tunnels during excavation to maintain an escape route for any burrowing owls inside the burrow. The implementation of the exclusion plan shall occur after successful relocation and prior to ground disturbance of heavy equipment staging. The exclusion plan shall be consistent with the CDFG guidelines (CDFG 2012) and developed in consultation with CDFG.

3.5.3 Relocation Mitigation Management Plan and Vegetation Management Goals

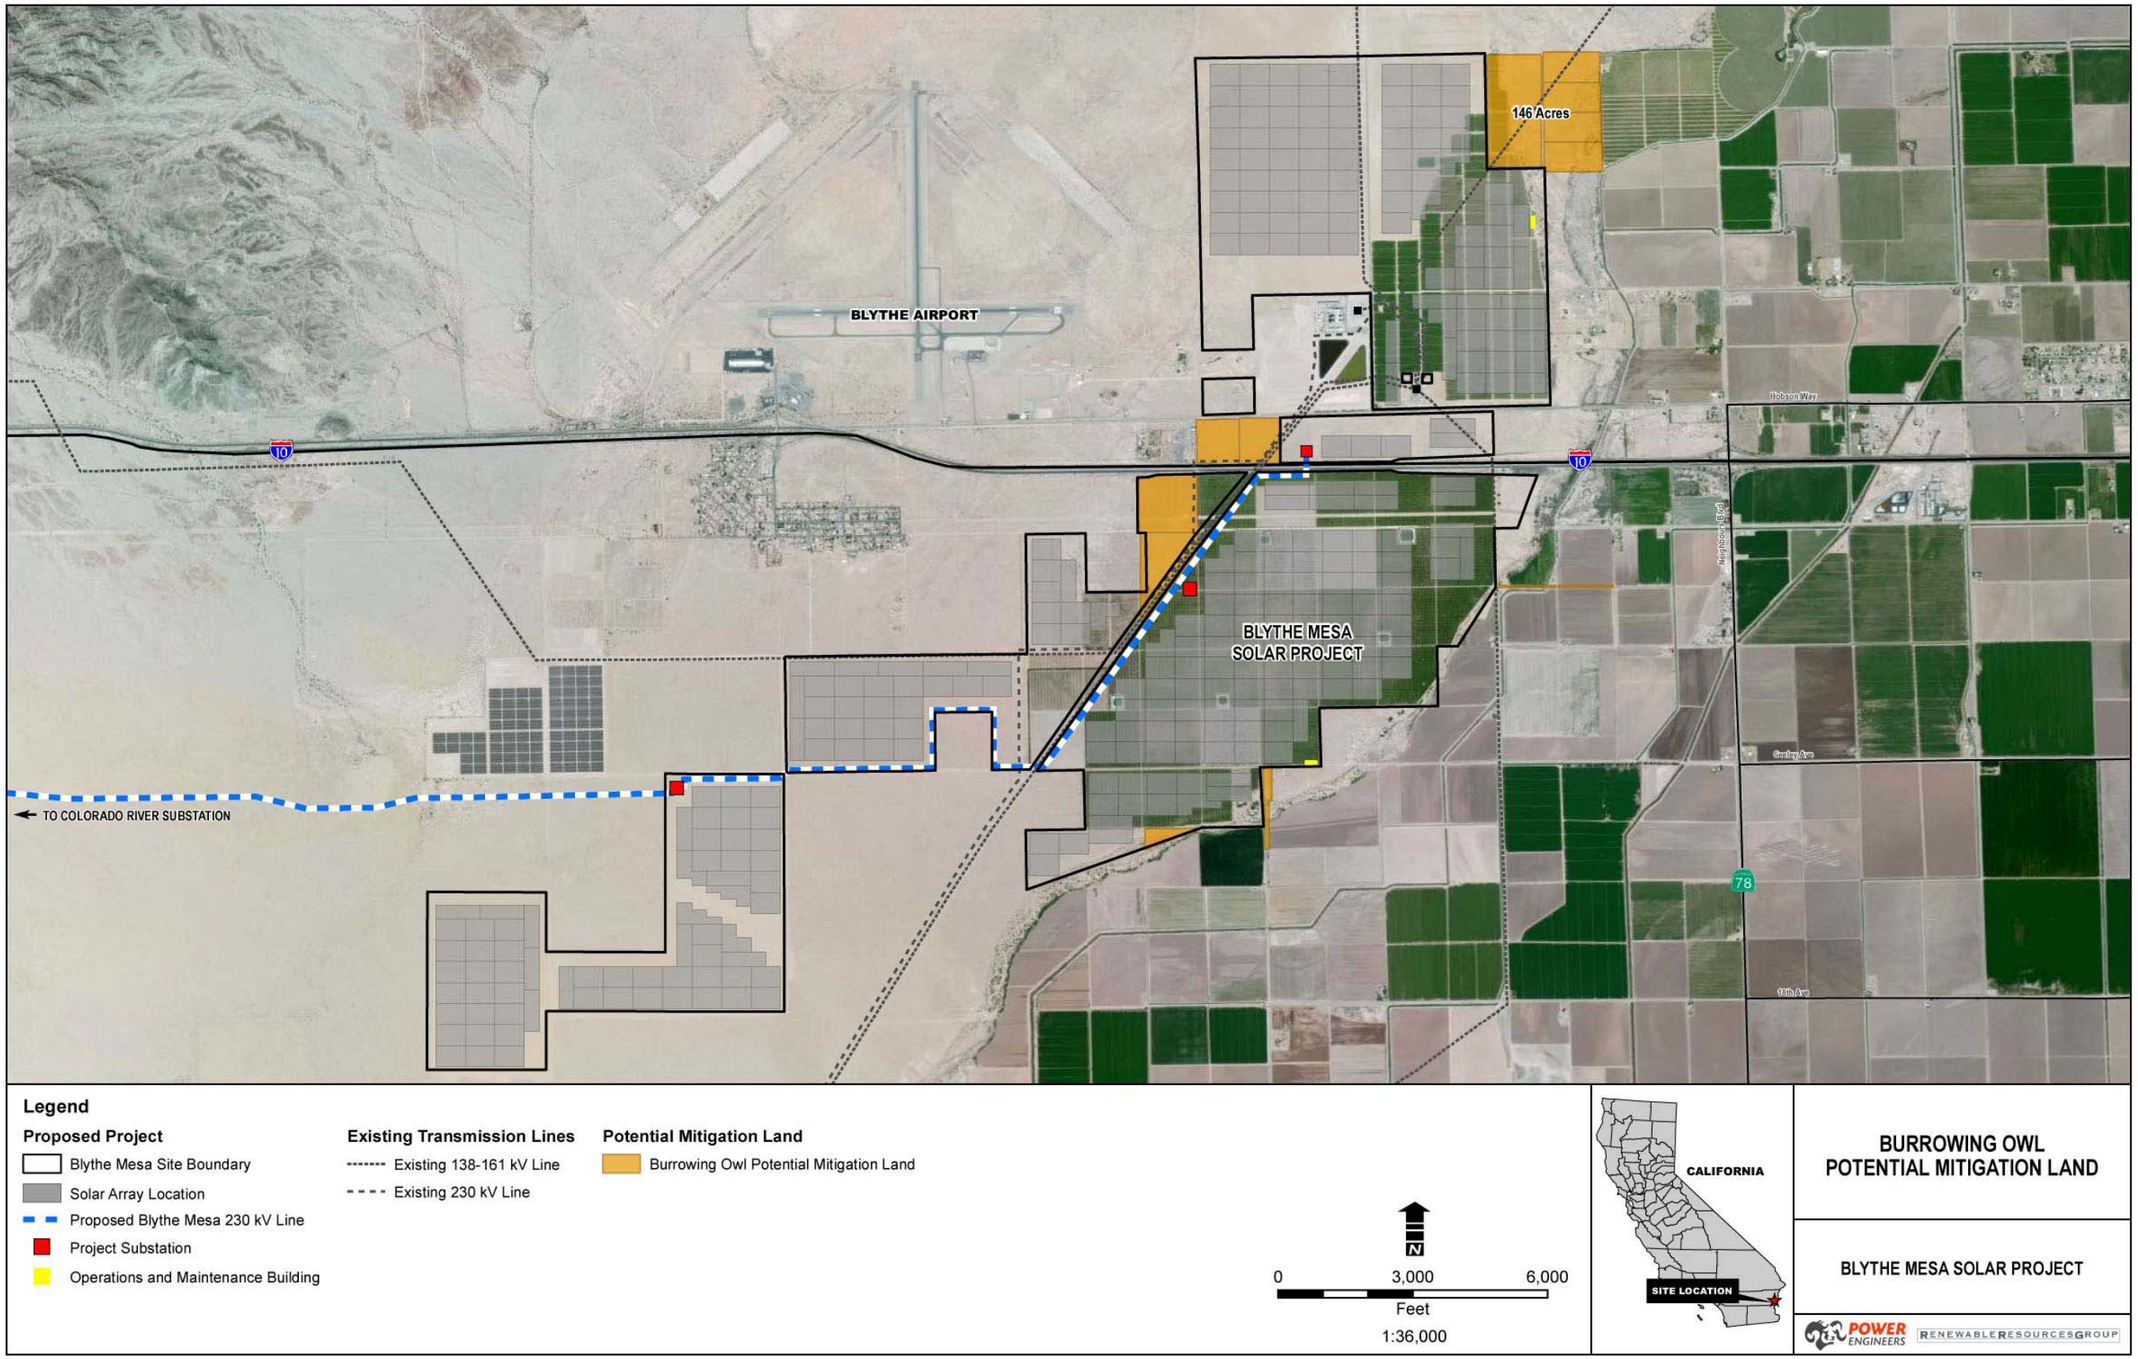
Monitoring of the mitigation site and vegetation will be implemented to ensure the appropriate maintenance for the mitigation site and that persistence of the burrowing owls on site is successful and long-term (CDFG 2012). Monitoring of the site will occur four times per year for a two-year program. Two visits will be conducted during the breeding season, and the other two visits will be conducted during the non-breeding season to evaluate the burrowing owl use of the artificial burrows or other natural burrows. The approved Biologists will also document site conditions within the mitigation area(s) with photographs and a monitoring memo report that will be provided to the maintenance contractor following

each visit. The monitoring memo will include specific guidance in the form of a list of necessary maintenance within the mitigation area(s).

Maintenance of artificial burrows shall occur three to four times during the year immediately following relocation, as necessary. Maintenance will include weed management, trash removal, semi-annual and annual artificial burrow cleaning and maintenance, and management of vegetation height and density (especially in immediate proximity to burrows) (Appendix F of CDFG 2012). The relocation mitigation management and vegetation plan shall be consistent with the CDFG guidelines (CDFG 2012) and developed in consultation with CDFG.

3.5.4 Reporting

An annual report will be submitted to CDFG, USFWS and County of Riverside following each breeding season for two years post-relocation. The annual reports will include the date when passive relocation efforts begin, the date of the burrow excavations, findings, initiation of construction activities, monitoring efforts, and vegetation management. Any injuries, mortality, or other unforeseen circumstances would be reported to all resource agencies within 24 hours.



The report would include the following data:

- Project name, location, and all pertinent information pertaining to the Project or Mitigation site
- Known predators or humans visiting or disturbing the Project or Mitigation site
- Dates of removal of one-way trap doors and the collapse of unoccupied burrows
- Monitoring results
- Weed removal efforts
- Any other pertinent data gathered through the exclusion, passive relocation efforts, and post-relocation monitoring

3.5.5 Western Burrowing Owl Compensation Lands

A total of 277 acres of habitat are located adjacent to the Project area and owned by RRG. It is anticipated that the available 146 acres would fully mitigate potential impacts to the burrowing owl. However, an additional 131 acres are available if needed. The California Burrowing Owl Consortium guidelines recommend 6.5 acres of compensation land be preserved and managed in perpetuity for each individual burrowing owl or burrowing owl pair identified as potentially impacted at the Project site. Based on the protocol burrowing owl surveys conducted in 2011, if it is assumed that nine active burrowing owl burrows are detected, the Project would require a minimum of 58 acres for compensation lands. However, per the 2012 CDFG mitigation guidelines, a pre-construction survey will be conducted to determine the number of burrowing owls and the amount of compensation land that shall be required to be protected.

FIGURE 4. POTENTIAL BURROWING OWL MITIGATION LAND

THIS PAGE INTENTIONALLY LEFT BLANK

4.0 CONTINGENCY PLANNING AND PROGRAM CONTACTS

An adaptive management program that functions within the constraints of the Project permit and approvals will be implemented to help handle any unanticipated circumstances that may arise. Adaptive management decisions will be made with input from pertinent regulatory agency staff in a timely manner to ensure the protection of the burrowing owl. The following is a list of agency staff members who shall be contacted, as applicable, on various aspects of relocation site selection and long-term management of the relocation site:

APPENDIX B: BEST MANAGEMENT PRACTICES

THIS PAGE INTENTIONALLY LEFT BLANK

The analysis assumes that the Applicants would implement the following BMPs to provide additional protection to western burrowing owl.

Drainage, Erosion, and Sedimentation Control Plan. As part of the County of Riverside's Conditional Use Permit (CUP) requirements, a Drainage, Erosion, and Sedimentation Control Plan would be developed for the Project. The plan would address the drainage, erosion, and sediment control requirements to support all activities associated with construction, operation, and decommissioning of the Project.
Stormwater Pollution Prevention Plan. In compliance with requirements of the National Pollutant Discharge Elimination System (NPDES) permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and prepared for the Project to ensure that protection of water quality and soil resources is consistent with County and State regulations.
Fugitive Dust Abatement Plan. As required by the Mojave Desert Air Quality Management District Rule 403, a Fugitive Dust Abatement Plan would be prepared to address fugitive dust emissions during Project construction, operation, and decommissioning.
Fire Management and Protection Plan. As required by existing law (Title 8 California Code of Regulations [CCR] Section 3221), a Fire Management and Protection Plan would be developed in consultation with the Riverside County Fire Department to identify potential hazards and accident scenarios that would exist at the facility during construction, operation, and decommissioning of the Project.
Trash Abatement Plan. A Trash Abatement Plan shall be developed that focuses on containing trash and food in closed and secure, sealable containers, with lids that latch, and removing them periodically to reduce their attractiveness to opportunistic species, such as common ravens, coyotes, and feral dogs, that could serve as predators of native wildlife and special-status animals. Also establish a regular litter pick-up procedure within and around the perimeter of the Project site, and remove from the Project site those containers associated with construction when construction is complete.
Integrated Weed Management Plan. In compliance with the Federal Noxious Weed Act, the Plant Protection Act, and the California Food and Agricultural Code, a Project-specific integrated weed management plan for the control of noxious weeds and invasive plant species would be prepared. The plan would identify presence, location, and abundance of weed species in the Project area and surrounding area adjacent to the Project, as well as identify suppression and containment measures to prevent the spread of weed species and introduction of weed species.
Project structures and building surfaces. Project facilities would be sited to ensure that there is adequate space (i.e., setbacks of no less than 100 feet) between solar facilities and natural washes. These setbacks would preserve and maintain the natural washes' hydrological functions.
Gen-tie lines. Gen-tie line support structures and other facility structures shall be designed to discourage their use by raptors for perching or nesting (e.g., by use of anti-perching devices).
Ground and surface disturbance. Construction boundaries would be clearly delineated to minimize areas of ground and surface disturbance. Ground-disturbing activities shall be minimized, especially during the rainy season. To the maximum extent possible, construction-related activities (such as vehicle and foot traffic) would avoid areas with intact biological soil crusts.
Travel and traffic. Vehicular traffic on site shall be confined to existing or designated travel routes and designated work areas. Access to the construction site and staging areas shall be limited to authorized vehicles and only through the designated roads.
Plants and wildlife. In compliance with the California Department of Fish and Game Codes, while on the Project property, workers or visitors would be prohibited from: feeding wildlife; moving live, injured, or dead wildlife off roads, ROWs, or the Project site; bringing domestic pets to the Project site; collecting native plants; and harassing wildlife. Areas where wildlife could hide or be trapped (e.g., open trenches, sheds, pits, uncovered basins, and laydown areas) would be minimized. For example, an uncovered pipe that has been placed in a trench should be capped at the end of each workday to prevent animals from entering the pipe. If a special-status species is discovered inside a component, that component must not be moved, or, if necessary, moved only to remove the animal from the path of activity, until the animal has escaped. As open trenches could impede the seasonal movements of large game animals and alter their distribution, they would be backfilled as quickly as possible. Open trenches could also entrap smaller animals; therefore, escape ramps would be installed along open trench segments at distances identified in the applicable land use plan or by the best available information and science. If traffic is being unreasonably delayed by wildlife in roads, personnel would contact the Project biologist, who will take any necessary action. Any vehicle-wildlife collisions would be immediately reported to the Project biologist. Observations of potential wildlife problems, including wildlife mortality, would be immediately reported to the BLM or other appropriate agency authorized officer.

1.0 INTRODUCTION

Power Engineers, Inc. (POWER) conducted a western burrowing owl (*Athene cunicularia hypugaea*) protocol-level survey for the Renewable Resources Group, LLC (RRG) as part of the proposed Blythe Mesa I Solar Project (BMSP, Project). The primary purpose of the surveys was to determine the presence or absence of burrowing owls within the defined study area. The study area is located within Riverside County, California near the community of Blythe; on approximately 3,679 acres in the Palo Verde Mesa (Figure 1). The study area for the purposes of this document is delineated on Figure 2 and includes a 125-foot proposed right-of-way along the transmission line.

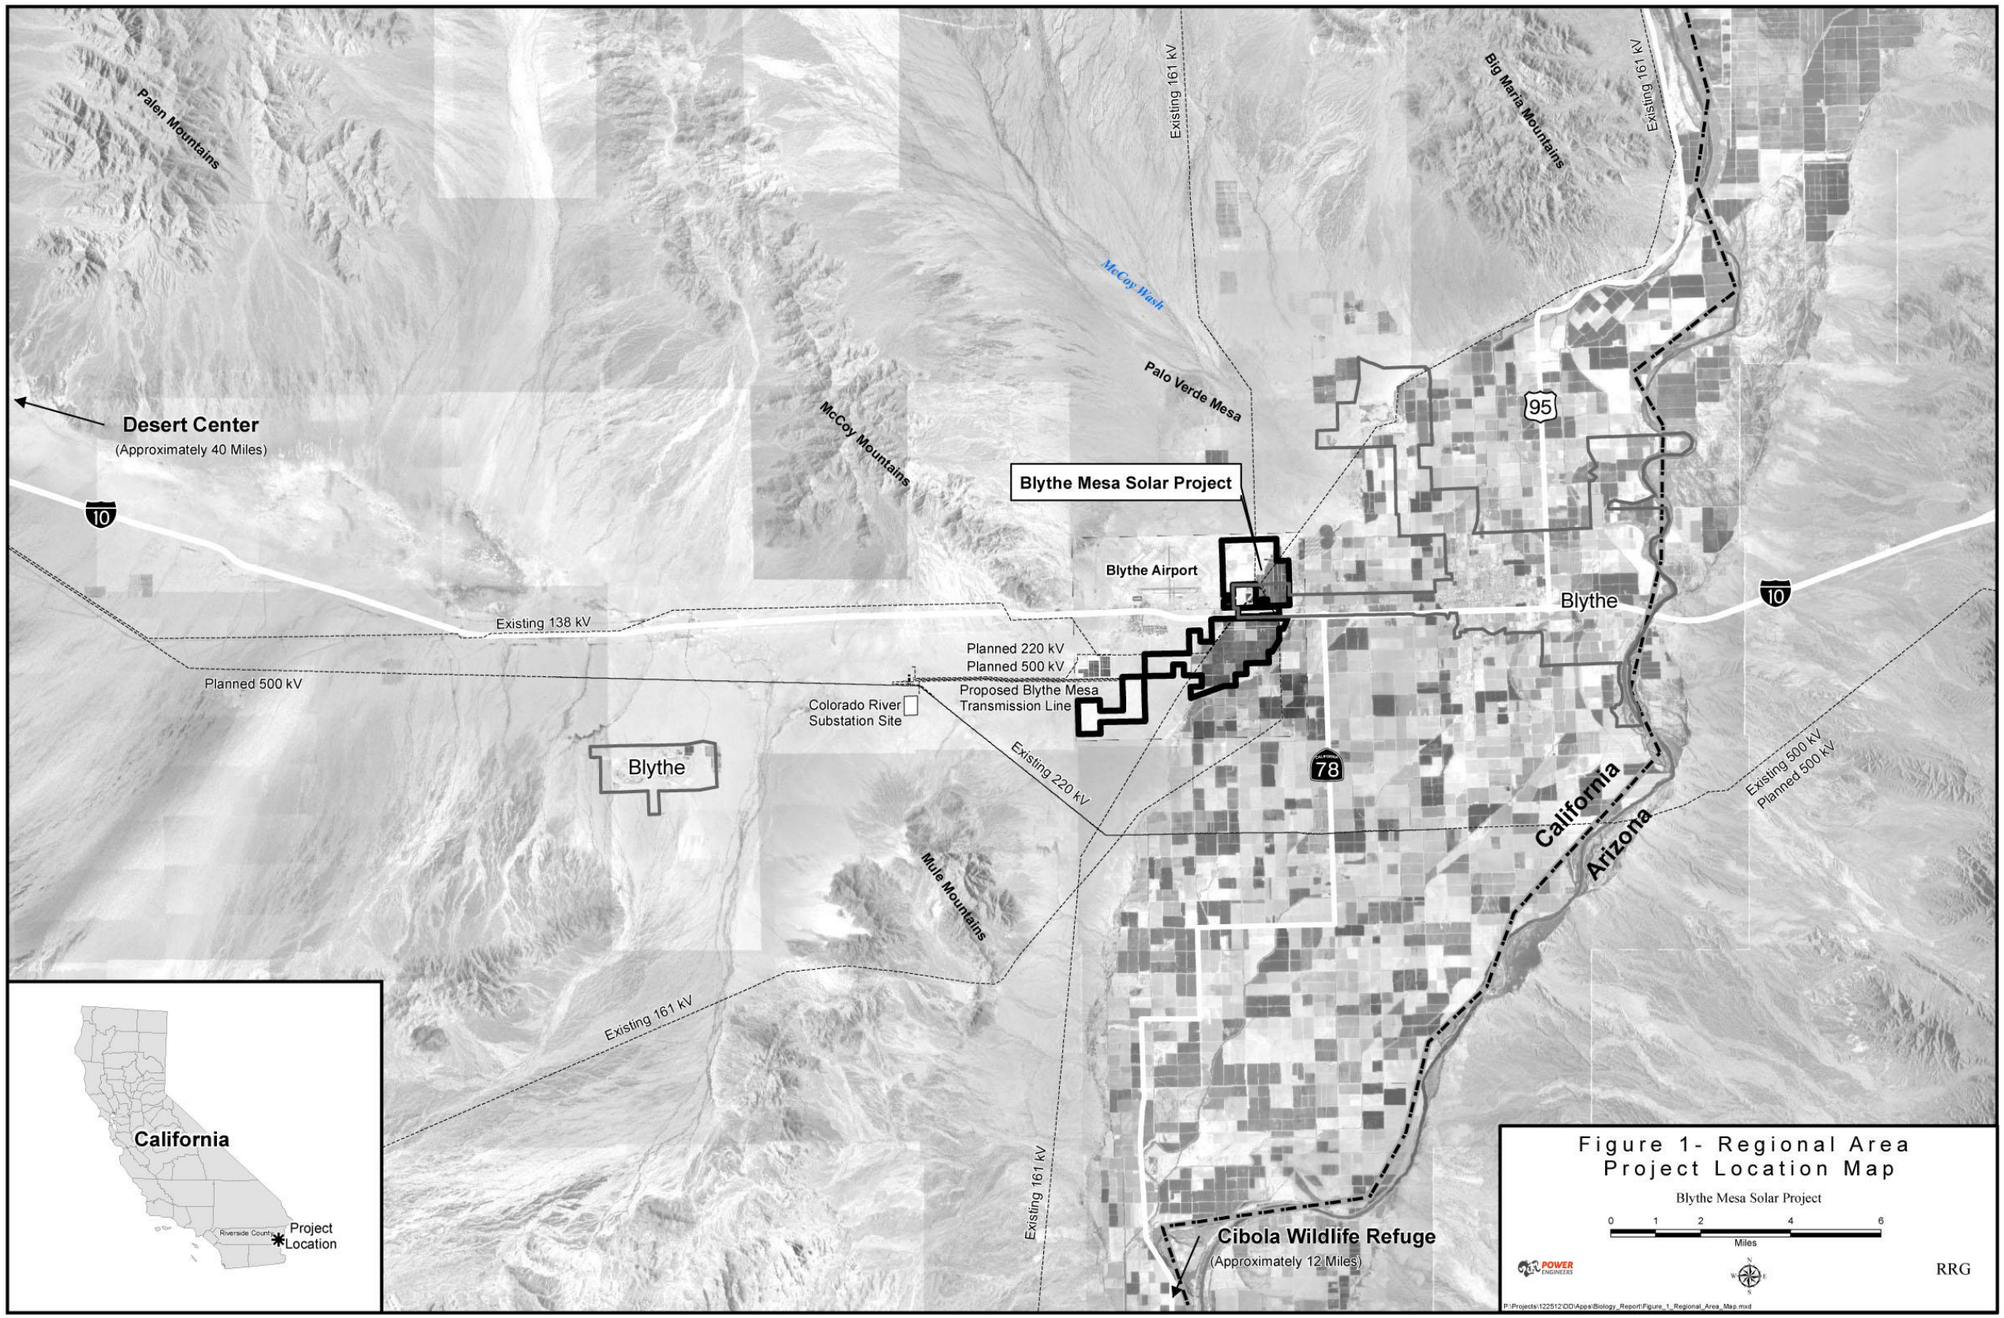
1.1 PROJECT OVERVIEW

The proposed Project consists of construction and operation of a 485 megawatt (MW) alternating current solar photovoltaic (PV) electrical generating facility and associated infrastructure to provide site access and connection to the statewide electricity transmission grid. The Project footprint is proposed to be located on approximately 3,660 acres in the Palo Verde Mesa region of Riverside County—3,587 for the solar field and 73 acres for the 230 kilovolt (kV) transmission line interconnect. POWER conducted the surveys within proposed Project transmission line footprint which included a 500 feet wide corridor centered on the 125-foot wide project right-of-way. The survey area of array parcels included a 500-foot (150-meter) wide buffer around the project limits. The proposed project would occupy a total of 3,660 acres and consist of the following components:

- Solar array field utilizing single axis solar PV trackers
- System of interior collection power lines located between inverters and substations
- Three on-site substations (approximately 300 feet long by 300 feet wide)
- Two operation and maintenance (O&M) buildings (approximately 3,500 square feet each)
- Two primary off-site access roads and several interior access roads
- 4.8 miles of 230 kV double-circuit transmission line between the solar field and Colorado River Substation

1.2 REGIONAL SETTING

The 3,660-acre site is five miles west of Blythe and consists mostly of agricultural land, including lemon orchards. The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5' U.S. Geological Survey (USGS) Topographic Quadrangles (see Figure 1). The Project is located on:



- Sections 11 and 12 of Township 7 South, Range 21East
- Sections 3, 4, 5, 6, 8, 9 of Township 7S, South, Range 22 East
- Sections 27, 28, 29, 32, 33, 34 of Township 6 South, Range 22 East, of the San Bernardino Base Meridian

State Highway 10 bisects the Project area, which is bounded on the north and south by undeveloped open desert, on the east by agricultural lands and on the west by the Blythe City Airport and open desert lands.

The Project area is located on the western mesa of the Palo Verde Valley. The topography is relatively flat and slopes toward the southeast; elevations range from 260 to 400 feet above mean sea level (AMSL). The subtropical climate of the Colorado Desert is currently characterized by dry, mild winters averaging 45 degrees Fahrenheit (˚F) and dry, hot summers that average 104˚F. Summer highs are known to reach up to 120˚F. Precipitation ranges between two and ten inches per year, with most of the precipitation occurring between November and March. Although rainfall occurs primarily in the winter months, the region is periodically influenced by tropical weather conditions, including sudden monsoonal summer storms which typically occur from July to later September.

THIS PAGE INTENTIONALLY LEFT BLANK

FIGURE 1 - REGIONAL AREA PROJECT LOCATION MAP

THIS PAGE INTENTIONALLY LEFT BLANK

1.3 EXISTING CONDITIONS

The proposed project consists primarily of desert scrub and agricultural lands. Along the four mile transmission line route and eastern and southern ends of the project limits there are discrete areas of disturbed native creosote scrub and disturbed stabilized dune and blow sand habitats. Table 1 presents the estimated acreage observed for each habitat type within the study area. This data does not represent the actual proposed project disturbance footprint for the solar areas, transmission lines, substations, and facility buildings and roads.

TABLE 1. OBSERVED HABITAT ACREAGE WITHIN THE STUDY AREA

Habitat	Acres	Percentage Within the Project Site
Bajada	18.07	0.5%
Creosote Scrub	46.74	1.3%
Desert Riparian Woodland Wash	2.83	0.1%
Disturbed	31.15	0.8%
Disturbed Creosote Scrub	233.44	6.3%
Disturbed Creosote Scrub and Fallow Agricultural	271.10	7.4%
Dune, Blowsand Desert Pavement	52.52	1.4%
Fallow	249.72	6.8%
Irrigated Cropland	404.02	11.0%
Irrigation Pond	17.21	0.5%
Mixed	75.92	2.1%
Non-Irrigated Cropland	1088.15	29.6%
Orchard	1188.36	32.3%
Total Project Area Acreage (Includes 125 ft right-of-way)	**3679.24**	**100.0%**

As listed above, the Project area comprises mainly agricultural land and desert scrub. Existing land consists of farmland, fallow farmland, creosote bush scrub, or stabilized desert dune and blowsand habitat. Active agricultural uses include citrus orchard and ornamental date palms, and wheat and alfalfa fields. Jojoba was previously grown for commercial purposes in some portions of the project area. The jojoba fields have been abandoned at some point in the recent past and are currently a mix of jojoba and reestablishing creosote bush scrub.

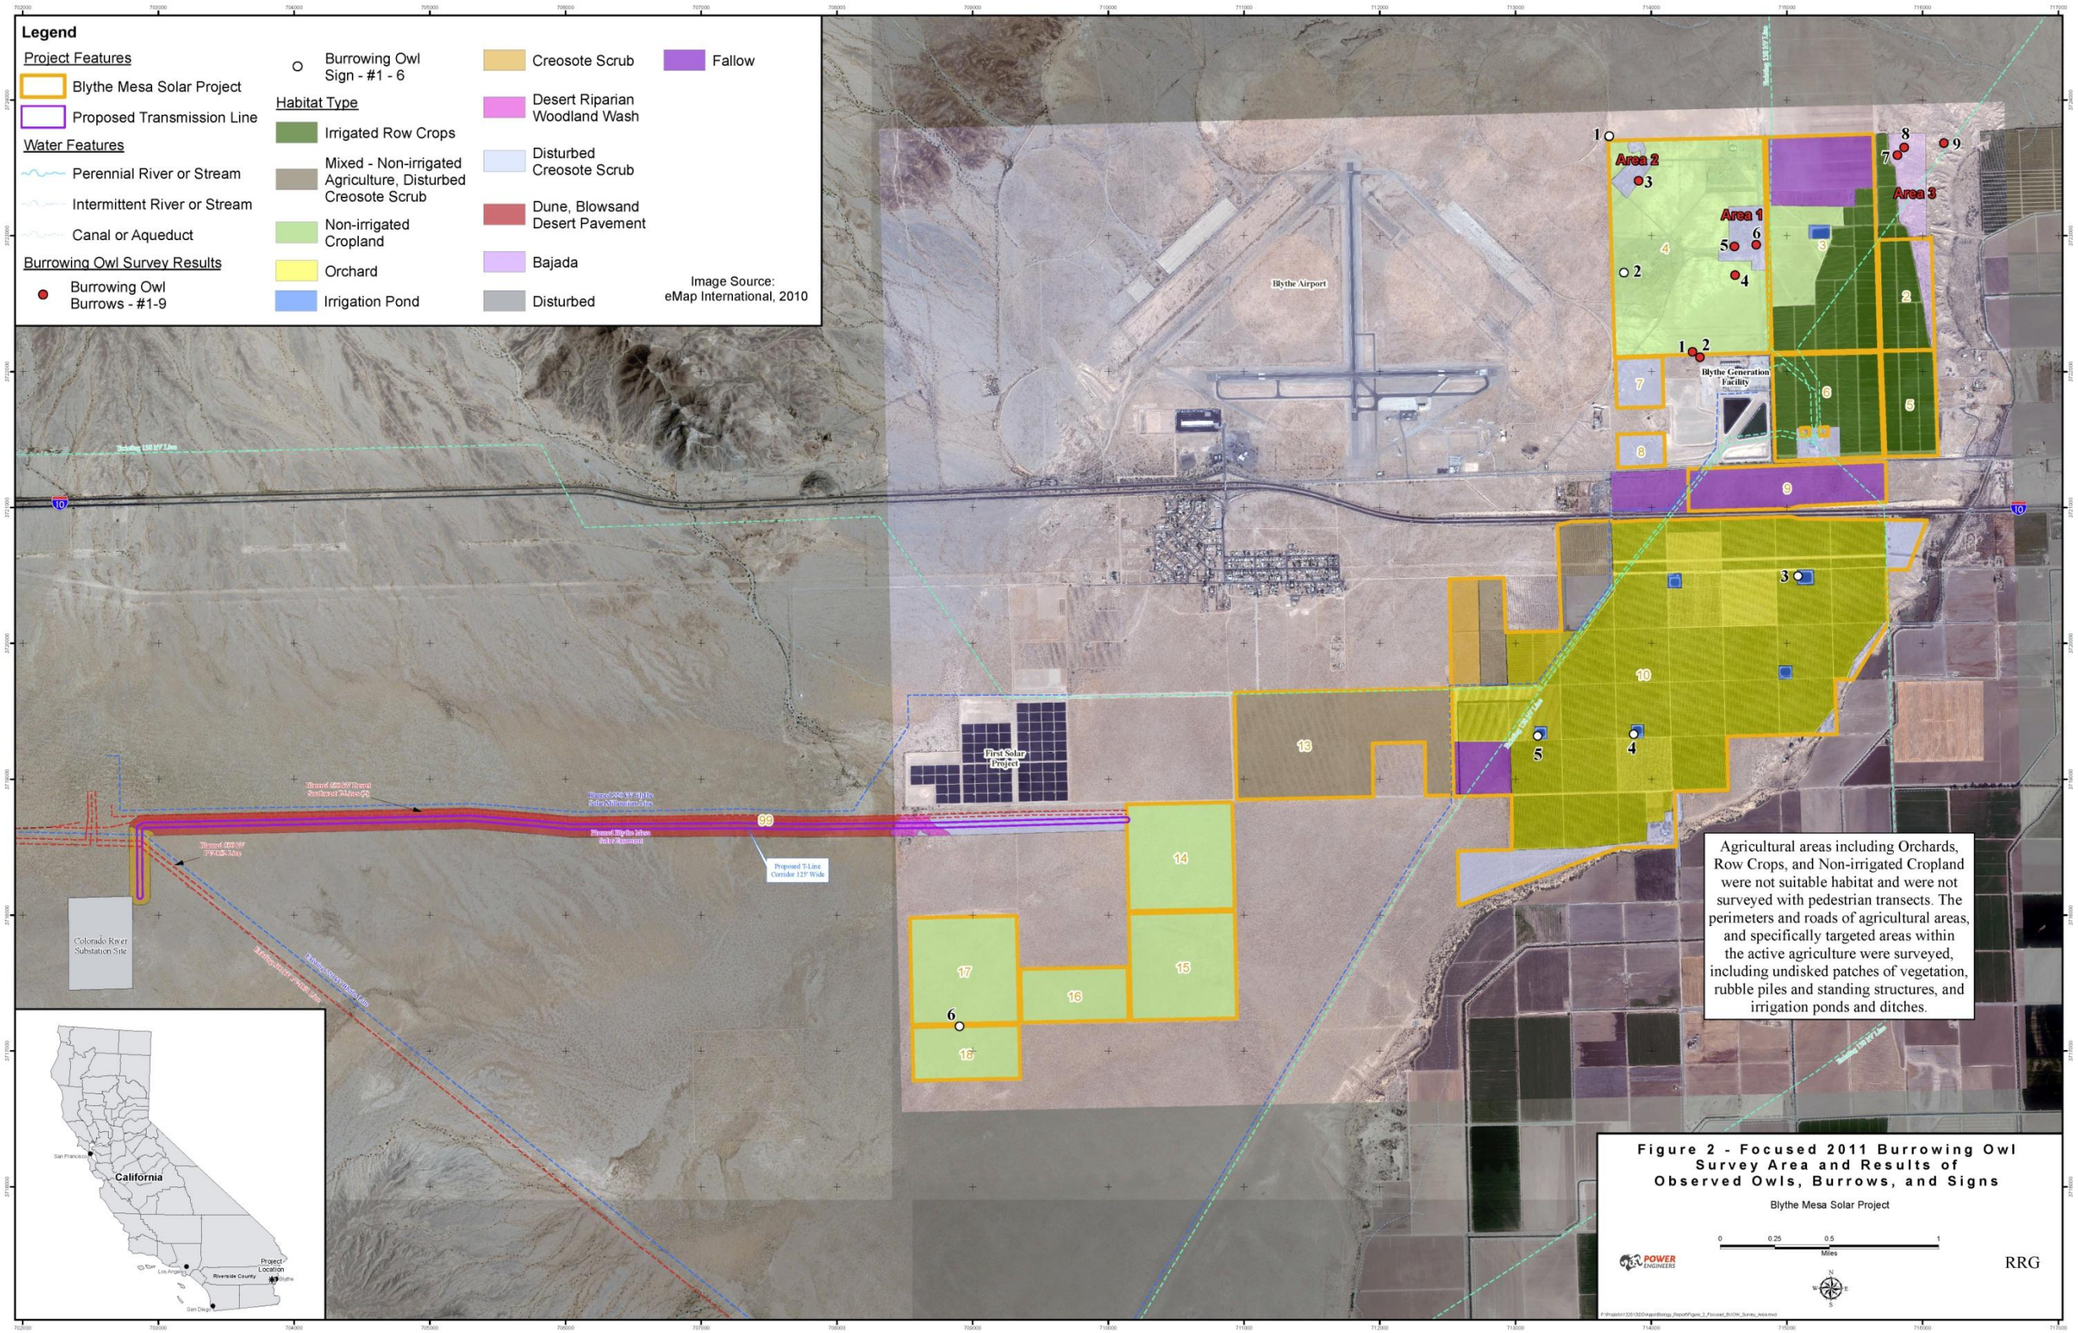
The study area is also situated among energy generating facilities (i.e., solar and natural gas-fired), active transmission lines, and electrical substations. Given the extent of the existing human-influenced environment (e.g., active agricultural operations [harvesting, discing, and planting]; high levels of automobile traffic [Interstate 10 bisects the Project]; energy generation, distribution and maintenance facilities; and ongoing aviation related activities) within the study area, any animals currently using these lands are assumed to be acclimated to the disturbance regime present.

2.0 SPECIES DESCRIPTION

Western burrowing owl is designated as a Priority 2 Bird Species of Special Concern by the California Department of Fish and Game (CDFG) due to rapid habitat loss and degradation from urbanization. It is also designated as a U.S. Department of the Interior, Bureau of Land Management (BLM) Sensitive species and a U.S. Fish and Wildlife Service (USFWS) Bird of Conservation Concern. Its range extends through all states west of the Mississippi Valley and into Mexico, Central America, and South America.

In California, it typically inhabits lowlands, including those in the Central Valley, northeastern plateau, southeastern deserts, and coastal areas. For shelters, the burrowing owl uses rodent burrows in sparse grassland, desert, and agricultural habitats, as well as open areas of pinyon-juniper or ponderosa pine habitats (CDFG 2008). Breeding populations generally display greater site fidelity than winter populations, which tend to move about more, even taking refuge into vegetation instead of nearby burrows (Poulin et al. 2011). Individuals in California, particularly Southern California, are mostly residents (CDFG 2008). Nesting begins from late March to August, peaking in April and May (CDFG 2008). While some pairs have been observed to have double broods within a single breeding season, it is considered to be uncommon and is not always successful (Poulin et al. 2011). Burrowing owls are typically active at dusk and dawn, but can sometimes be active at night, as well.

3.0 SURVEY METHODOLOGY



Collection of burrowing owl baseline data in the Project area included a review of the California Natural Diversity Database (CNDDB) records and of applicable biological documents, including several solar projects that have completed burrowing owl surveys. Additionally, a systematic pedestrian assessment of the study area to determine the habitat suitability for burrowing owls was conducted on the 5th and 6th of May 2011.

Protocol surveys were started on May 6 and extended through July 23, 2011. Survey methods were derived from generally accepted professional standards, the 1993 California Burrowing Owl Consortium (CBOC) Burrowing Owl Survey Protocol and Mitigation Guidelines (CBOC 1993), and the 1995 CDFG Staff Report on Burrowing Owl Mitigation (CDFG 1995). In summary, a methodical pedestrian survey for owl burrows was conducted by walking through areas of suitable habitat within the study area, including man-made structures. In addition, biologists visited the Cibola National Wildlife Refuge (CNWR) 12 miles to the south of the Project limits to view the known burrowing owls there as a reference population; biologists saw six burrowing owls foraging near an agricultural field at the CNWR, which confirmed activity in middle to late July in this region of the owls' range.

POWER biologists Tom Herzog, Steve Hicks, Ken McDonald, and Melissa Lippincott, and Garcia and Associates, Inc. biologists Andrew McCadden, Angelique Herman, and Laura Megill conducted pedestrian survey transects, spaced at approximately 100 feet to allow for 100% visual coverage of the study area. Where necessary, transect spacing was reduced or expanded to account for differences in terrain, vegetation density, and visibility. The locations of all potential owl burrows and sign were recorded and mapped using handheld global positioning devices and aerial imagery. Figure 2 presents the protocol burrowing owl survey areas for the Project area.. Incidental observations of other avian species, plants and other wildlife were also noted. The presence of each observed wildlife species was based on direct observation of individual(s), sign, and/or vocalization.

Field surveys were conducted when weather conditions were conducive to observing owls and other avian species. The surveys were not performed during rain, high winds (greater than 20 mph), dense fog, or temperatures over 90 ºF. Observations were made from the nearest appropriate vantage points with the use of binoculars when access to discrete portions of the study area were not possible due to private property, topographic relief, physical barriers, health and safety considerations, etc.

FIGURE 2 – FOCUSED BURROWING OWL SURVEY AREA, OBSERVED OWLS, BURROWS AND SIGN

THIS PAGE INTENTIONALLY LEFT BLANK

4.0 SURVEY RESULTS

A nine-quad search of the CNDDB (CNDDB, 2011a) including USGS quadrangles McCoy Peak, McCoy Wash, Blythe NE, Roosevelt Mine, Ripley, Blythe, Thumb Peak, Palo Verde, and Mule Wash identified 46 occurrences of burrowing owls in the Blythe area, with two occurrences on the Project site. In addition to the CNDDB records search, recent surveys and reports for similar projects near the Project area were also reviewed (Table 2).

TABLE 2. ADJACENT PROJECT SURVEY INFORMATION

Species	Project	Species Detected	BMSP Survey Area Overlap
Burrowing Owl	Blythe Solar Power Project	Yes, two within solar site, four in transmission line and multiple sign. Not determined how sign was confirmed.	Overlaps with BMSP transmission line and Colorado River Substation (CRS) survey areas.
	Genesis Solar Energy Project	Yes, three individuals detected around the generation tie line and one burrow around the main site.	No overlap
	Devers-Palo Verde No. 2 500 kV Transmission Line Project	Burrow sites detected along project segment that encompasses Colorado River Substation, but specific locations not mapped.	The project areas overlap at the CRS.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route	Yes, burrowing owls detected along southern telecom route. Three owls detected just east of Colorado River Substation.	Project areas overlap at and near the CRS but otherwise do not share the same corridors. Northern telecom route is approximately one mile from the BMSP transmission line corridor.
	Devers-Palo Verde No. 2 500 kV Transmission Line Project Colorado River Substation Expansion	See Blythe Solar and Devers-Palo Verde Telecom survey results above.	BMSP would tie into this substation. Surveys conducted on and around the substation site would overlap with the BMSP.
	First Solar Electric Blythe Solar 1 Project	No surveys conducted. Biological analysis based on a desktop study of existing information.	Project area is located directly adjacent (north) to the BMSP transmission line.
	Blythe Airport Solar Project	No.	Project area is located directly adjacent (west) to the northeastern BMSP solar array area.

4.1 FIELD RESULTS

During the habitat assessment survey, biologists determined that the Project area contained suitable habitat conditions to support burrowing owls. Of the 3,679 acres in the study area, approximately 1,970 acres (54%) of suitable burrowing owl habitat were identified (Figure 2). Suitable habitat consisted of both fallow and active agricultural fields, irrigation ponds and canals, and creosote bush scrub. Suitable habitat also occurred along the edges of orchards. The remaining 1,703 acres consisted of orchards and alfalfa fields. Orchards within the project area did not contain suitable habitat; burrowing owls prefer open areas and do not inhabit areas with dense vegetation (U.S. Fish and Wildlife Service, 2003). Alfalfa fields provide suitable forage areas for burrowing owls, but heavy and frequent disturbance of the fields by disking and harvesting decreases burrow availability. Burrows can occur along the edges of agricultural fields, orchards and road banks; all road banks, field edges and irrigation ditches along the agricultural areas throughout the Project site were surveyed. Six irrigation ponds located in the orchard area and irrigation channels throughout the agricultural area and to the east of the project limits provide accessible fresh water for wildlife.

The field data from the protocol surveys identified the presence of six burrowing owls during the May survey and eight owls during the July surveys, and an additional two owls were observed outside the project site but within the survey buffer. Nine suitable burrows or burrow complexes were observed in the northern portion of the site (Figure 2). No suitable burrows were observed in the southern portion of the site. Soil conditions in the southern half of the site within Project Parcels 4, 13-18 and the transmission corridor were very sandy and unstable. However, burrowing owl sign (white wash, pellets, feathers) was observed in five locations in the southern region of the Project area. Burrows observed in the southern half of the site belonged to either kit fox (*Vulpes macrotis*) or kangaroo rat (*Dipodomys* sp.). No burrowing owl sign was observed near the kit fox burrows. Several of the kit fox burrows were recent and active kit fox sign was documented; however, most of the burrows were old and collapsed and would not support burrowing owl because the instability of the soil.

During the July surveys (14-19 and 21-23) burrowing owl activity and use was determined to the extent possible. Burrows were monitored at sunrise or sunset on different days to ensure a complete activity period was evaluated for each observed bird. The northern end of the Project site was divided into three burrowing owl monitoring sites. Please refer to Figure 2 for the location of Areas 1, 2, and 3.

Area 1 supported four burrowing owls. The four burrowing owls were observed flying in and out of three separate concrete / brick lined cylindrical, man-made structures, which have concrete collars above ground level and are open to below ground level to a depth of approximately four feet. Appendix C includes site photographs and images of the well location burrows and these described elements. In Area 1, Burrow #4 contained the greatest number of observed sign, including pellets, prey detritus, feathers, and white wash. Burrows # 5 and 6 also featured significant amounts of pellets, detritus, white wash, and feathers. Biologists were unable to determine if the owls were two separate pairs or one pair with two juveniles. Burrowing owls at Area 1 consistently exhibited social and foraging behavior. Several perch sites were favored in this area, including a metal rod with a rounded top, a fence post, a large pile of cleared vegetation and, most frequently, the edges of the concrete wells. Area 1 consisted of approximately five acres of disturbed creosote bush scrub dominated by creosote bush and bur sage; concrete rubble piles from old demolished barracks were scattered throughout the creosote bush scrub. Area 1 was bound on the south, west and north by recently tilled, non-irrigated wheat fields that have been farmed for approximately one year. This field is bound to the north by open space comprising creosote scrub habitat, and to the west by disturbed creosote scrub habitat within the area of the former military base and current Blythe Airport.

In Area 2, two burrowing owls occupied a single burrow located in a concrete rubble pile. The two owls were observed consistently during morning and evening hours perched on top of the rubble pile. Burrowing owl tracks were identified around and into the rubble pile, with feathers and pellets near a small burrow entrance beneath the rubble. Sex and age of the two burrowing owls observed during the surveys was not established. The burrowing owls occupying Area 2 were easily distressed and would flush and call to one another whenever biologists entered the vicinity. Area 2 consisted of approximately two acres of disturbed creosote bush scrub dominated by creosote bush and bur sage. Concrete rubble piles and two concrete foundations were scattered throughout the creosote bush scrub. Area 2 was surrounded to the south, east and north by recently tilled, non-irrigated wheat fields and disturbed creosote bush scrub to the west.

In Area 3, two burrowing owls occupied a burrow complex within a native Bajada area in the buffer study area. One burrow appeared to be a former canid burrow due to its size, shape, and location in an area of naturally formed earth mounds. Biologists identified three separate burrowing complexes on the earth mounds within an approximately ten-acre zone. Each burrow complex contained several burrows with recent sign, including white wash, feathers, tracks, and pellets. The two burrowing owls were typically

perched on top of earthen mounds when the biologists accessed the area. Biologists could not determine if the pair was nesting without additional harassment.

4.2 WILDLIFE AND PLANTS OBSERVED DURING BURROWING OWL SURVEY

Round-tailed ground squirrel (*Spermophilus tereticaudus*) and white-tailed antelope squirrel (*Ammospermophilus leucurus*) burrows where observed throughout the northern and eastern portions of the site along road sides, agricultural fields and disturbed areas with mounded soils or dump sites. Creosote bush (*Larrea tridentata*) was the dominant species in undisturbed portions of the site. Additional plants and wildlife species frequently observed within suitable habitat included bur sage (*Ambrosia dumosa*), wheat (*Triticum* sp.), mourning dove (*Zenaida macroura*), white-wing dove (*Zenaida asiatica*), horned lark (*Eremophila alpestris*), greater roadrunner (*Geococcyx californianus*), black-tailed jackrabbit (*Lepus californicus*), desert iguana (*Dipsosaurus dorsalis*), and western whiptail (*Cnemidophorus tigris*). Three CDFG Species of Special Concern, Le Conte's thrasher (*Toxostoma lecontei*), loggerhead shrike (*Lanius ludovicianus*) and Mohave fringe-toed lizard (*Uma scoparia*) were observed in multiple locations on both the northern and southern portions of the Project area. Complete plant and wildlife species observed are included in Appendices A and B.

5.0 CONCLUSION

The study area supports a relatively small population of burrowing owl, and based on the burrowing owl survey results from surrounding solar projects burrowing owl may occupy habitat outside of the study area limits (AECOM 2010, Aspen 2011). It was not determined if this population is increasing or decreasing in size or the length of occupancy. The surveys determined that in July 2011, eight individual burrowing owls were present within the study area and may be directly or indirectly affected by the Project. This determination is valid for 12 months from the completion of this report (October 2011 through October 2012). The number of owls or burrows affected at the time of ground disturbance may be greater than or less than this number because of the natural variation in the owl population in this region, and natural and man-made conditions that may occur prior to construction.

APPENDIX A – OBSERVED PLANT LIST

AR061328

Plant Species Observed During Surveys

Scientific Name	Common Name
ANGIOSPERMS (DICOTYLEDONS)	
AMARANTHACEAE	**AMARANTH FAMILY**
Tidestromia oblongifolia	honeysweet
APIACEAE	**CARROT FAMILY**
Lomatium sp.	lomatium
ASCLEPIADACEAE	**MILKWEED FAMILY**
Asclepias sp.	milkweed
Asclepias subulata	rush milkweed
Sarcostemma cynanchoides ssp. hartwegii	climbing milkweed
ASTERACEAE	**SUNFLOWER FAMILY**
Ambrosia dumosa	burro bush
Baileya pauciradiata	Colorado Desert marigold
Bebbia juncea	sweetbush
Chaenactis sp.	pincushion
Chaenactis stevioides	desert pinchushion
Dicoria canescens	bugseed
Geraea canescens	desert sunflower
Hymenoclea salsola	cheesebush
Palafoxia arida	Spanish needles
Pluchea sericea	arrow weed
Stephanomeria pauciflora	wire lettuce
BORAGINACEAE	**BORAGE FAMILY**
Cryptantha sp.	cryptantha
Cryptantha angustifolium	narrowleaf cryptantha
Cryptantha costata	ribbed cryptantha
Cryptantha maritime	Guadalupe cryptantha
Cryptantha nevadensis	cryptantha
Cryptantha pterocarya	wing nut cryptantha
Nama demissum	purple desert mat
Pectocarya sp.	pectocarya
Tiquilia palmeri	Palmer's tiquilia
Tiquilia plicata	plicate tiquilia
BRASSICACEAE	**MUSTARD FAMILY**
*Brassica tournefortii**	Sahara mustard
*Buxus microphylla**	Japanese box
Lepidium sp.	peppergrass
Lepidium lasiocarpum	peppergrass
Simmondsia chinensis	jojoba
CASUARINACEAE	**SHE OAK FAMILY**
Casuarina sp.*	she oak
CACTACEAE	**CACTUS FAMILY**
Cylindropuntia echinocarpa	golden cholla
Mammillaria sp.	fish-hook cactus
CHENOPODIACEAE	**GOOSEFOOT FAMILY**
Atriplex canescens	four-wing saltbush
Atriplex lentiformis	quail brush

Scientific Name	Common Name
*Bassia hyssopifolia**	five-hooked bassia
Salsola tragus	Russian thistle
CUCURBITACEAE	**GOURD FAMILY**
Cucurbita sp.*	squash
EUPHORBIACEAE	**SPURGE FAMILY**
Stillingia spinulosa	annual stillingia
FABACEAE	**LEGUME FAMILY**
Acacia greggii	cat claw acacia
Astragalus sp.	astragalus
Cercidium floridum	palo verde
Dallea mollissima	downy dalea
*Medicago sativa**	alfalfa
Olneya tesota	desert ironwood
Prosopis sp.	mesquite
Prosopis glandulosa	Honey mesquite
Psorothamnus emoryi	indigobush
Psorothamnus schottii	indigobush
GERANIACEAE	**GERANIUM FAMILY**
*Erodium cicutarium**	red-stemmed filaree
LOASACEAE	**LOASA FAMILY**
Eucnide urens	rock nettle
Mentzelia sp.	blazing star
Mentzelia multiflora	blazing star
Petalonyx thurberi ssp. thurberi	sandpaper plant
MARTYNIACEAE	**UNICORN PLANT FAMILY**
Proboscidea althaeifolia	desert unicorn plant
MYRTACEAE	**MYRTLE FAMILY**
Eucalyptus sp.*	gum tree
NYCTAGINACEAE	**FOUR O'CLOCK FAMILY**
Abronia villosa	sand verbena
ONAGRACEAE	**EVENING PRIMROSE FAMILY**
Camissonia boothii	bottlebrush primrose
Oenothera deltoids ssp. deltoides	bird-cage primrose
PLANTAGINACEAE	**PLANTAIN FAMILY**
Plantago erecta	western plantain
Plantago ovata	wooly plantain
POLEMONIACEAE	**PHLOX FAMILY**
Eriastrum harwoodii	Harwood's eriastrum
Gilia sp.	
Langloisia setosissima	lilac sunbonnet
POLYGONACEAE	**BUCKWHEAT FAMILY**
Chorizanthe brevicornu	brittle spineflower
Chorizanthe rigida	rigid spineflower
Eriogonum sp.	
RESDACEAE	**MIGNONETTE FAMILY**
Oligomeris linifolia	Narrow-leaf oligomeris
ROSACEAE	**ROSE FAMILY**

Scientific Name	Common Name
*Prunus persica**	peach
RUTACEAE	**RUE FAMILY**
*Citrus limon**	lemon
*Citrus sinensis**	orange
TAMARICACEAE	**TAMARISK FAMILY**
*Tamarix ramosissima**	Mediterranean tamarisk
VISCACEAE	**MISTLETOE FAMILY**
Phoradendron californicum	desert mistletoe
ZYGOPHYLLACEAE	**CALTROP FAMILY**
Larrea tridentata	creosote bush
ANGIOSPERMS (MONOCOTYLEDONS)	
ARECACEAE	**PALM FAMILY**
Phoenix sp.*	date palm
LILIACEAE	**LILY FAMILY**
Hesperocaulis undulata	desert lily
POACEAE	**GRASS FAMILY**
Pleuraphis rigida	galleta grass
*Schismus barbatus**	Mediterranean schismus
*Triticum aestivum**	wheat

* = non-native species

APPENDIX B – OBSERVED WILDLIFE LIST

Scientific Name	Common Name
CLASS INSECTA	**INSECTS**
MELOIDAE	**BLISTER BEETLES**
Lytta auriculata	red-eared blister beetle
TENEBRIONIDAE	**DARKLING BEETLES**
Asbolus verrucosus	desert ironclad beetle
Eleodes spinipes	darkling beetle
MANTIDAE	**MANTIDS**
Litaneutria minor	ground mantis
PIERIDAE	**WHITE & SULPHUR BUTTERFLIES**
Pieris rapae	cabbage white
Pontia protodice	checker-white
NYMPHALIDAE	**BRUSH-FOOTED BUTTERFLIES**
Vanessa virginiensis	Virginia lady
LYCAENIDAE	**GOSSAMER WING BUTTERFLIES**
Brephidium exilis	pygmy blue
FORMICIDAE	**ANTS**
Messor pergandei	desert harvester ant
MUTILLIDAE	**VELVET ANTS**
Dasymutilla sp.	velvet ant
POMPILIDAE	**SPIDER WASPS**
Pepsis formosa	tarantula wasp
CLASS AMPHIBIA	**AMPHIBIANS**
Bufo woodhousii	Woodhouse's toad
CLASS REPTILIA	**REPTILES**
TRIONYCHIDAE	**SOFTSHELL TURTLES**
Apalone spinifera	spiny softshell turtle
IGUANIDAE	**IGUANID LIZARDS**
Callisaurus draconoides draconoides	common zebra-tailed lizard
Dipsosaurus dorsalis	desert iguana
Phrynosoma sp.	horned lizard
Uma scoparia	Mojave fringe-toed lizard
Uta stansburiana	common side-blotched lizard
TEIIDAE	**WHIPTAIL LIZARDS**
Cnemidophorus sp.	whiptail
COLUBRIDAE	**COLUBRID SNAKES**
Arizona elegans occidentalis	Glossy snake
Chinoactis occipitalis	shovel-nosed snake
VIPERIDAE	**VIPERS**
Crotalus cerastes	sidewinder

Scientific Name	Common Name
CLASS AVES	**BIRDS**
CATHARTIDAE	**NEW WORLD VULTURES**
Cathartes aura	turkey vulture
ACCIPITRIDAE	**HAWKS, KITES, EAGLES**
Buteo jamaicensis	red-tailed hawk
FALCONIDAE	**FALCONS**
Falco sparverius	American kestrel
ODONTOPHORIDAE	**NEW WORLD QUAIL**
Callipepla gambelii	Gambel's quail
CHARADRIIDAE	**PLOVERS**
Charadrius vociferus	killdeer
COLUMBIDAE	**PIGEONS & DOVES**
Columba livia	rock pigeon
Streptopelia risoria	ringed turtle-dove
Zenaida aurita	white-winged dove
Zenaida macroura	mourning dove
CUCULIDAE	**CUCKOOS & ROADRUNNERS**
Geococcyx californianus	greater roadrunner
STRIGIDAE	**TRUE OWLS**
Athene cunicularia	burrowing owl
APODIDAE	**SWIFTS**
Aeronautes saxatalis	white-throated swift
TYRANNIDAE	**TYRANT FLYCATCHERS**
Tyrannus verticalis	western kingbird
ALAUDIDAE	**LARKS**
Eremophila alpestris	horned lark
HIRUNDINIDAE	**SWALLOWS**
Petrochelidon pyrrhonota	cliff swallow
CORVIDAE	**JAYS & CROWS**
Corvus corax	common raven
LANIIDAE	**SHRIKES**
Lanius ludovicianus	loggerhead shrike
STURNIDAE	**STARLINGS**
Sturnus vulgaris	European starling
ICTERIDAE	**BLACKBIRDS**
Agelaius phoeniceus	red-winged blackbird
Euphagus cyanocephalus	Brewer's blackbird
Icterus cucullatus	hooded oriole
Xanthocephalus xanthocephalus	yellow-headed blackbird
Quiscalus mexicanus	great-tailed grackle

Scientific Name	Common Name
MIMIDAE	**MOCKINGBIRDS & THRASHERS**
Toxostoma lecontei	Le Conte's thrasher
THRAUPIDAE	**TANAGERS**
Piranga ludoviciana	Western tanager
SYLVIIDAE	**GNATCATHERS**
Polioptila caerulea	black-tailed gnatcatcher
EMBERIZIDAE	**EMBERIZIDS**
Zonotrichia leucophrys	white-crowned sparrow
FRINGILLIDAE	**FINCHES**
Carduelis tristis	American goldfinch
CLASS MAMMALIA	**MAMMALS**
LEPORIDAE	**HARES & RABBITS**
Lepus californicus	black-tailed jackrabbit
Sylvilagus audubonii	desert cottontail
SCIURIDAE	**SQUIRRELS**
Ammospermophilus leucurus	white-tailed antelope squirrel
Spermophilus tereticaudus	Round-tailed ground squirrel
HETEROMYIDAE	**POCKET MICE & KANGAROO RATS**
Dipodomys sp.	kangaroo rat
CANIDAE	**WOLVES & FOXES**
Canis familiaris	domestic dog
Canis latrans	coyote
Vulpes macrotis	kit fox
MUSTELIDAE	**WEASELS, SKUNKS & OTTERS**
Taxidea taxus	American badger
BOVIDAE	**BISON, GOATS & SHEEP**
Ovis canadensis	bighorn sheep (skull)
CHIROPTERA	**BATS**
Myotis sp.	Myotis

APPENDIX B: PRE-CONSTRUCTION NESTING SURVEY PROTOCOL

THIS PAGE INTENTIONALLY LEFT BLANK

The following protocol is intended to help assist with the discovery of bird nests in or around the solar array and gen-tie line prior to construction. This protocol is not suitable to survey for golden eagle nests, which are typically found in mountainous areas, but is instead intended to meet the need to locate passerine, corvid, and raptor nests.

Equipment

All surveyors should possess and use a professional set of binoculars while conducting the nesting survey. A spotting scope may also be necessary for distant nests, nests that are in tall trees, or to determine if or how many birds are in an active nest. At least one GPS should be carried, as well as a rangefinder and compass in the event that approaching a nest could be dangerous to the birds inside it. Flagging is also suggested to mark vegetation where nests are found as an additional safeguard.

Survey Period and Time

Surveys should be conducted in and around the project area (a 500-foot survey buffer from project limits is suggested) no more than two weeks prior to construction if construction is to take place between February and August. Surveys should be repeated for each new section of the project that is undertaken For example, if construction crews are working in one area for several weeks and then move to another area a mile away, a pre-construction nesting survey should be conducted in the new area.

While nests can be located during any time of day with sufficient daylight, surveys should ideally be conducted within the first three hours after sunrise or before sunset, depending on temperature. These periods are when birds are most likely to be located while foraging or singing, and may increase the likelihood of finding a nest.

Survey Conditions

Surveys should be conducted under clear conditions. Rain, high winds, or other inclement weather that can affect visibility or the ability of surveyors to move through vegetation may make it less likely to find nests or increase the risk of destroying a nest if located in a shrub or on the ground. Weather conditions including temperature, cloud cover, and precipitation should be recorded.

Survey Protocol

It is suggested that all surveyors be able to identify the commonly-occurring bird species of the area and be familiar with the habitat types within the project area. If surveyors are present who are not familiar with this information, they should survey alongside an experienced surveyor to reduce the chance of uncertain observations or unidentified birds. Surveyors should be spaced10-20 feet apart depending on the density of vegetation cover and should walk transects to cover 100% of upcoming work areas. If birds are found to be using alarm calls during the survey, particular attention and care should be given to that area, as it may indicate a nest nearby. If possible, surveyors should wait until the adult bird(s) leaves before approaching this area to reduce the risk of nest abandonment. All nest, species, and behavioral data should be recorded on the appropriate datasheet (Appendix C).

APPENDIX C: CONSTRUCTION NEST MONITORING FORMS

1.0 INTRODUCTION

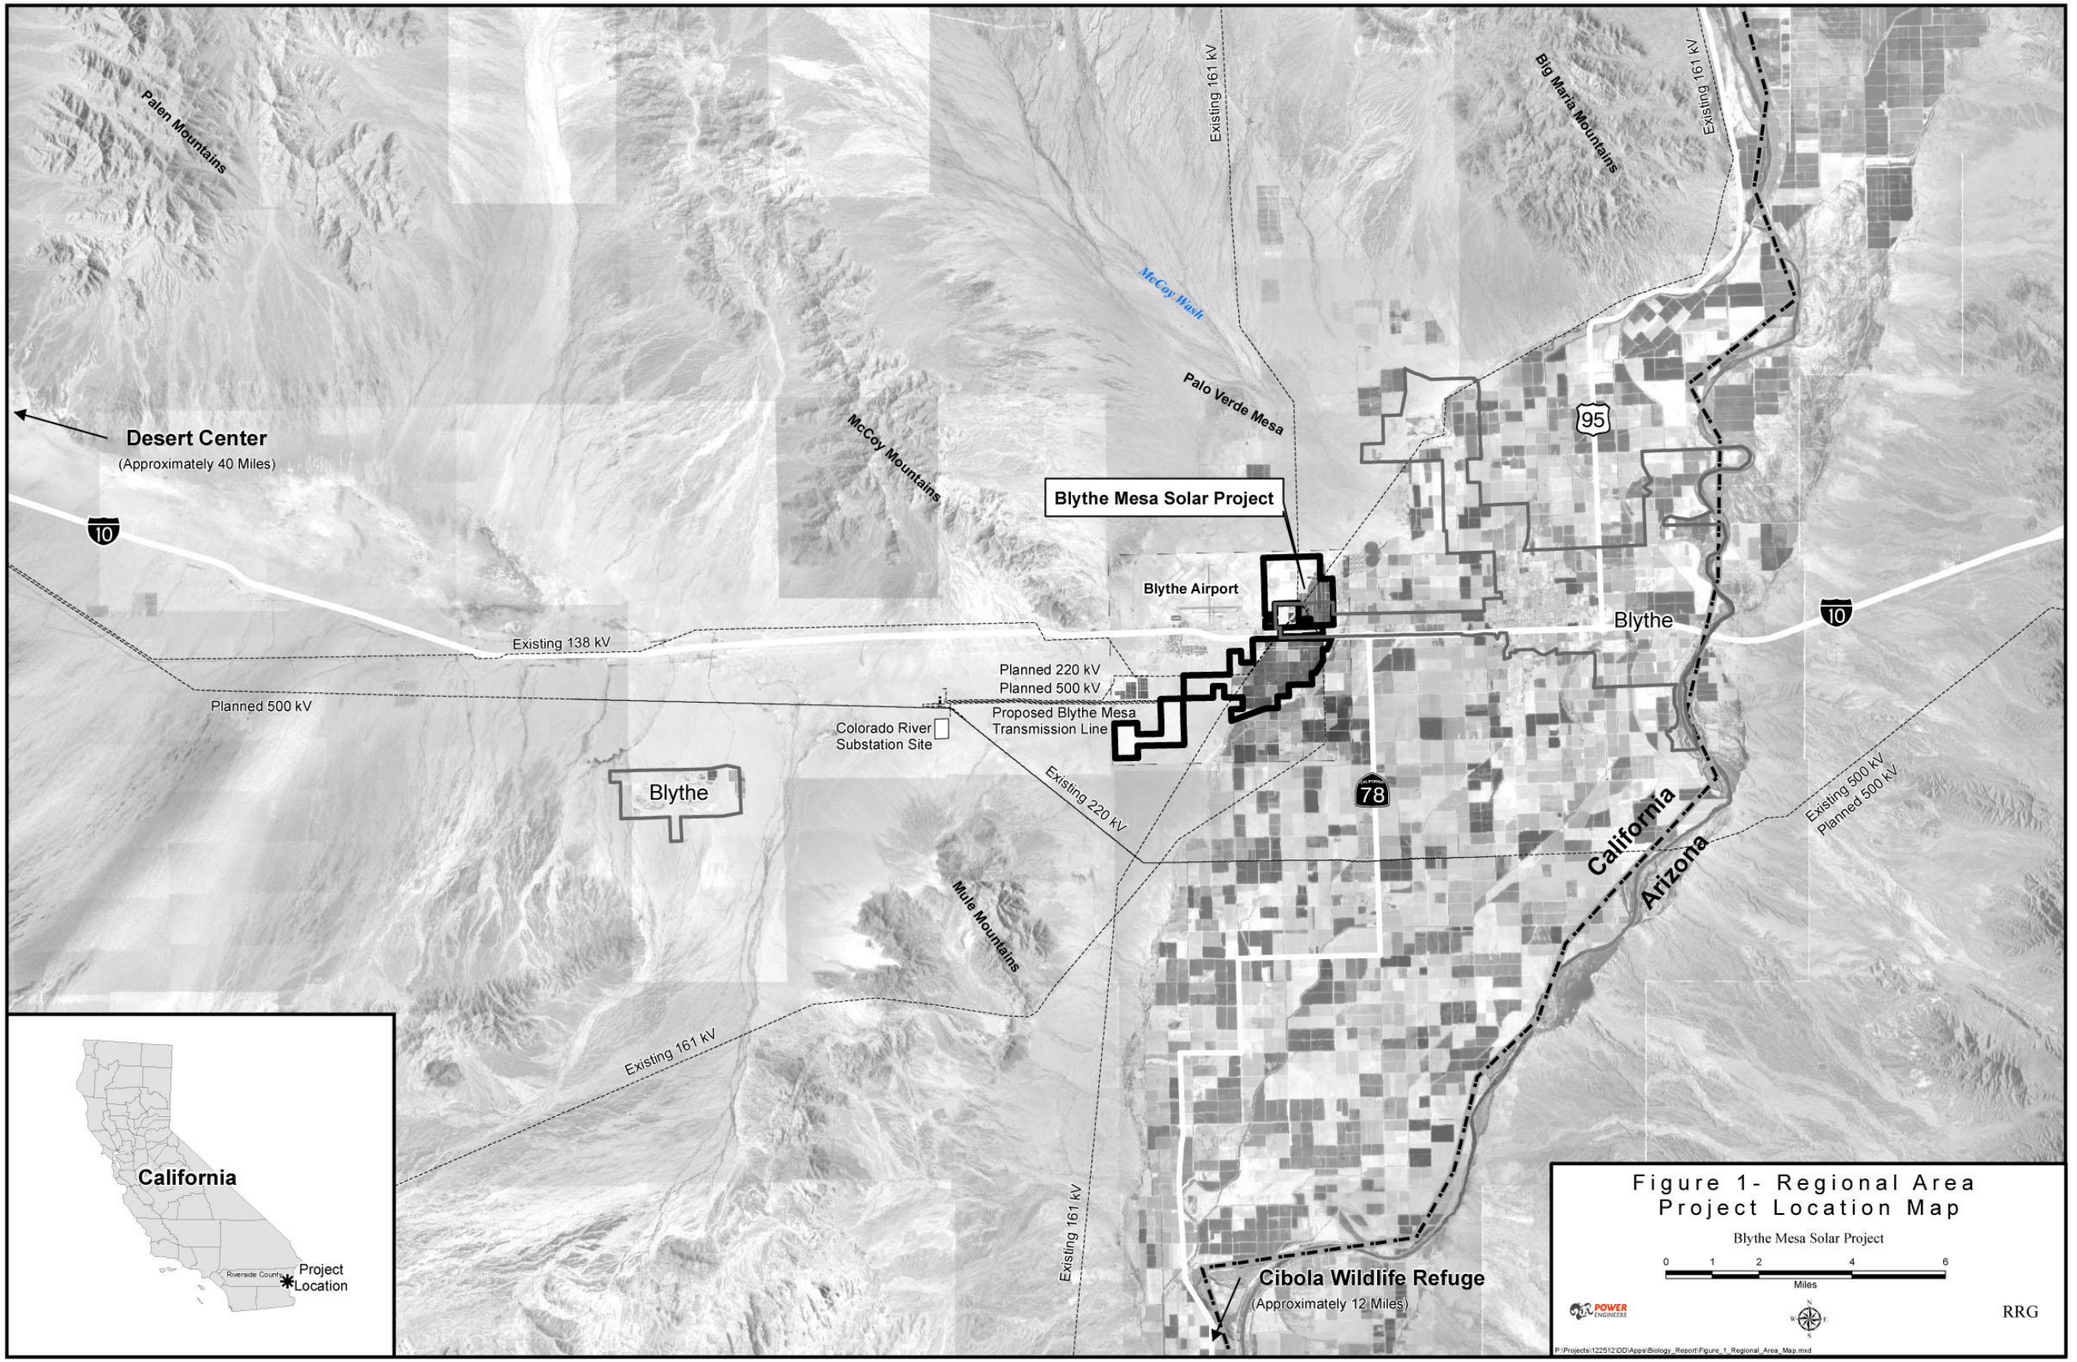
The Blythe Mesa Solar Project (Project) includes a 485-megawatt (MW alternating current solar photovoltaic (PV) electrical generating facility and 8.4-mile gen-tie line that would occupy a total of 3,660 acres in the Palo Verde Mesa region of Riverside County (Figure 1). Once constructed, the Project would occupy 3,587 acres for the solar facility component and 73 acres for the 230 kV gen-tie line. The power produced by the Project would be conveyed to the local power grid via interconnection to the Southern California Edison (SCE) Colorado River Substation, an approved new substation located south of Interstate 10 (I-10) and approximately five miles west of the Project site.

The following report describes the results of an investigation and assessment to determine the potential presence of waters of the United States (i.e., Federal waters) within the boundaries of the Project. The information contained in this report is intended to provide the U.S. Army Corps of Engineers (USACE) with sufficient information to determine whether there are water features on the project site that are subject to jurisdiction under Section 404 of the federal Clean Water Act.

1.1 Project Location

The proposed Project is located in east Riverside County, approximately five miles west of central Blythe and 40 miles east of Desert Center; more specifically, the proposed Project is located north and south of I-10, west of Neighbors Boulevard and Arrowhead Boulevard, and south and east of the Blythe Airport (Figure 1). The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5' U.S. Geological Survey (USGS) Topographic Quadrangles. The Project is located on:

- Sections 11 and 12 of Township 7 South, Range 21 East
- Sections 3, 4, 5, 6, 8, 9 of Township 7S, South, Range 22 East
- Sections 27, 28, 29, 32, 33, 34 of Township 6 South, Range 22 East, of the San Bernardino Base Meridian



1.2 Environmental Setting

The Project area is located on the western mesa of the Palo Verde Valley. The valley is a portion of the Colorado River floodplain. The Project area is on Palo Verde Mesa and is situated in the greater Sonoran Desert. The topography is relatively flat and slopes toward the southeast; elevations range from 260 to 400 feet above mean sea level (AMSL). The Project area is near the Big Maria Mountains on the northwest, the McCoy Mountains on the west, the Mule Mountains on the southwest, and the Colorado River on the east. These mountain ranges, trending northwest to southeast, create a natural barrier between the Colorado River and the greater Colorado Desert. Approximately 70% of the solar facility area is actively cultivated agricultural land, 24% is previously disturbed by agricultural or military activities, and 6% is undisturbed. Agricultural land use within the solar facility site includes drip-irrigated citrus orchards, flood-irrigated alfalfa, non-irrigated winter wheat, abandoned jojoba orchards, and fallow fields. The gen-tie line corridors would pass through BLM lands and other private lands mainly comprising desert scrub habitat and disturbed lands associated with existing infrastructure. Several utility lines and maintenance roads run through or parallel the gen-tie line corridors. Additionally, the Project area has been previously disturbed by off-road vehicle use, trash dumping, and historic use for military training during World War II. The Project area borders or is in the vicinity of Nicholls Warm Springs/Mesa Verde, an existing solar facility, Blythe Airport, the 520 MW natural gas-fired Blythe Energy Center, electrical substations, electrical transmission lines, I-10, and other paved and dirt roads. The Project area is bound on the east by agricultural land use that extends through the Palo Verde Valley to the Colorado River.

FIGURE 1. REGIONAL AREA PROJECT LOCATION MAP

THIS PAGE INTENTIONALLY LEFT BLANK

1.2.1 Vegetation

The Project area consists primarily of desert scrub and agricultural lands. Along the four-mile transmission line route and eastern and southern ends of the Project limits there are discrete areas of disturbed native creosote scrub and disturbed stabilized dune and blow sand habitats. Table 1 presents the estimated acreage observed for each habitat type within the study area. This data does not represent the actual proposed Project disturbance footprint for the solar array areas, transmission lines, substations, and facility buildings and roads.

Table 1. Vegetation Communities and Cover Types (Acres)

Vegetation Communities and Other Cover Types	Acreage on the Solar Array Site Project Boundary	Acreage on the Proposed Gen-tie Line**	Acreage on the Northern Alternative Gen-tie Line**	Acreage on the Southern Alternative Gen-tie Line**
Bajada	18.1	0.0	0.0	0.0
Creosote Bush Scrub	41.9	278.8	303.6	232.3
Desert Riparian Woodland Wash	0.0	22.9	22.9	11.4
Disturbed Creosote Scrub	220.1	0.0	0.5	0.3
Disturbed/Ruderal	31.2	0.5	0.0	0.0
Fallow Agriculture	249.7	0.0	0.0	0.0
Irrigated Alfalfa	404	0.0	0.0	0.0
Irrigation Pond	17.2	0.0	0.0	0.0
Mixed – Drip-irrigated Jojoba and Disturbed Creosote Scrub	347	0.0	0.0	0.0
Non-irrigated Wheat	1088.2	0.0	0.0	0.0
Orchard	1188.4	0.0	0.0	0.0
Total Acreage	**3605.8 acres***	**302.1 acres**	**327 acres**	**244.1 acres**

*The acreage was calculated using GIS data and totals 3,605 acres; however, the County calculates the same area as 3,587 acres.
**A 250-foot buffer was placed on either side of the gen-tie centerline to account for potential indirect and direct impacts to biological resources.

Eleven vegetation communities and other cover types were identified within the Project area during the field surveys (Table 1; Figure 2). Vegetation communities were mapped according to the second edition of *A Manual of California Vegetation, Second Edition* (Sawyer *et al.*, 2009). Community classifications were based on dominant species comprising approximately 50 percent or more of the total cover within the mapped unit relative to the list of dominant species for a given vegetation community.

Bajada. Bajadas are essentially alluvial fans or desert washes. This community is present in the northeastern corner of the Project area and is typically characterized as the shallow, sandy, braided bottoms of wide canyons. This community most closely resembles Holland's "Mojave Desert Wash Scrub," Code 63700 (Holland 1986).

Creosote Bush Scrub/Disturbed Creosote Scrub. Within the study area, this community is characterized by sandy soils with a shallow clay pan on a broad gentle southeast-trending slope. Dominant plants within the study area for this community include creosote bush, burro brush, brittlebush (*Encelia farinosa*), and cheesebush. This is the most common plant community consisting of non-agricultural plants within the study area. This plant community intergrades into the desert riparian woodland wash. Within the study area, there are areas of desert pavement that are covered with rounded cobbles that range in size from one

to three inches. Typically, these areas are higher than the surrounding landscape by three to 15 feet. These areas are within creosote bush scrub, though the plant density is lower. Sonoran creosote bush scrub is designated by Holland as Code 33100 and Sawyer Keeler-Wolf and Evens as the Ocotillo Series (Holland 1986 and Sawyer *et al*. 2009). Within the gen-tie corridors, the creosote bush scrub is relatively undisturbed, except for occasional vehicle tracks. In these areas, fine sand drifts are interspersed within this community type; the Emory's indigo bush occurs in stands and is more prevalent than in other portions of the creosote bush scrub.

There are more areas of disturbed creosote bush scrub in the solar array area compared to the gen-tie line. Past disturbances in these areas consist of military training and agricultural use, including cultivation of jojoba (*Simmondsia chinensis*). These disturbances occurred in the past, and the Sonoran creosote bush scrub within the solar array area has been recovering through natural recruitment. Two invasive plant species, Russian thistle (*Salsola tragus*) and Sahara mustard (*Brassica tournefortii*), can be found in disturbed areas throughout the study area, especially near roads and fallow and active agricultural areas. Another exotic plant, Mediterranean grass (*Schismus* sp.), is prevalent throughout the creosote bush scrub.

Desert Riparian Woodland Wash. This vegetation community consists of open, drought-deciduous, riparian scrub woodland and is made up of three primary components: wash-dependent vegetation, vegetated ephemeral dry wash, and islands of Sonoran creosote bush scrub (e.g., riparian interfluves). Dominant and indicator plants of this community within the study area include honey mesquite (*Prosopis glandulosa*), palo verde (*Cercidium floridum*), desert ironwood (*Olneya tesota*), cat-claw acacia (*Acacia greggii*), and rush milkweed (*Asclepias subulata*). Creosote bush (*Larrea tridentata*) and burro brush (*Ambrosia dumosa*) were scattered throughout the canopy. The herbaceous layer is dominated by desert plantain (*Plantago ovata*), *Cryptantha* spp., and Mediterranean grass (*Schismus barbatus*). Of the vegetation communities listed in Table 3.2.4-1, the CDFG considers desert riparian woodland wash to be a sensitive habitat/biological resource. In addition, desert riparian woodland wash is a special community type (i.e., high priority for inventory in the CNDDB) per the CDFG's Vegetation and Mapping Program. Desert riparian woodland wash is equivalent to Holland's desert dry wash woodland (Code 62200) and Sawyer, Keeler-Wolf and Evens' Catclaw Acacia Series (Holland 1986 and Sawyer *et al*. 2009).

Irrigated Cropland/Irrigation Pond/Orchard/Jojoba/Wheat. These community types fall into the broader category of agriculture. The majority of agricultural land within the proposed solar array disturbance area is fallow and active agriculture. It includes lands that are currently under cultivation and those that are abandoned (e.g., fallow). Within abandoned agriculture areas, native vegetation is growing back; Russian thistle, Sahara mustard, and other exotic plants were observed interspersed with the native vegetation and are indicative of past agricultural disturbance.

Disturbed/Ruderal. Disturbed/Ruderal communities have been previously disturbed and have been converted to mostly non-native, weedy areas. Ruderal vegetation is that which grows quickly in disturbed areas and may consist of native species, such as fire-following plants, or non-native species, such as invasive grasses or forbs. Examples of invasive species that would occur in these areas include redstem filaree (*Erodium cicutarium*), Sahara mustard, and Mediterranean grass. Ruderal areas in the Project area are primarily concentrated within the proposed solar array area.

1.2.2 Climate and Hydrology

The subtropical climate of the Colorado Desert is currently characterized by dry, mild winters averaging 45 degrees Fahrenheit (˚F) and dry, hot summers that average 104˚F. Summer highs are known to reach up to 120˚F. Precipitation ranges between two and ten inches per year, with most of the precipitation occurring between November and March. Although rainfall occurs primarily in the winter months, the region is periodically influenced by tropical weather conditions, including sudden monsoonal summer storms, which typically occur from July to later September.

The Project is located in an undefined Hydrologic Sub-Area (HSA 715.40) of the Palo Verde Hydrologic Area within the Colorado (River) Hydrologic Unit in eastern Riverside County, California. Surface water is minimal on the Palo Verde Mesa, limited to seasonal and perennial sources. The Project would be located near the eastern edge of the Palo Verde Mesa, above the Palo Verde Valley and west of the 100-year floodplain of the Colorado River. Lands not utilized for agriculture are crossed by a number of small ephemeral drainages, generally flowing from northwest to southeast toward the Colorado River, either dissipating prior to reaching the edge of the Mesa or flowing into the valley. Precipitation in the form of sheet flow typically flows overland toward the edge of the Mesa. In areas used for agriculture, flow may be diverted by earthen berms or irrigation ditches. Sheet flow eventually reaches the edge of the Mesa and flows into the canal and drain system of the Palo Verde Valley south of 10th Street. This system eventually returns water to the Colorado River via the Outfall Drain, approximately 18 miles south of the Project. Perennial water comes from the Colorado River, which lies eight miles east of the Project area and is the primary source of irrigation water for agriculture in the area.

1.2.3 Soils

The USDA survey identified 15 soil types on the solar facility site (see Figure 3, *Soils*). These include: Aco gravelly loamy sand; Aco sandy loam; badland; Carrizo gravelly sand; Cibola silty clay loam; duneland; Imperial silty clay; Meloland fine sandy loam; Orita fine sand; Orita gravelly fine sandy loam; Ripley very fine sandy loam; Rositas fine sand 0 to 2 percent slopes and 2 to 9 percent slopes; Rositas fine sand, wet, 0 to 2 percent slopes; and Rositas gravelly loamy sand, 0 to 2 percent slopes. None of the soils identified are characteristic of wetlands for California.

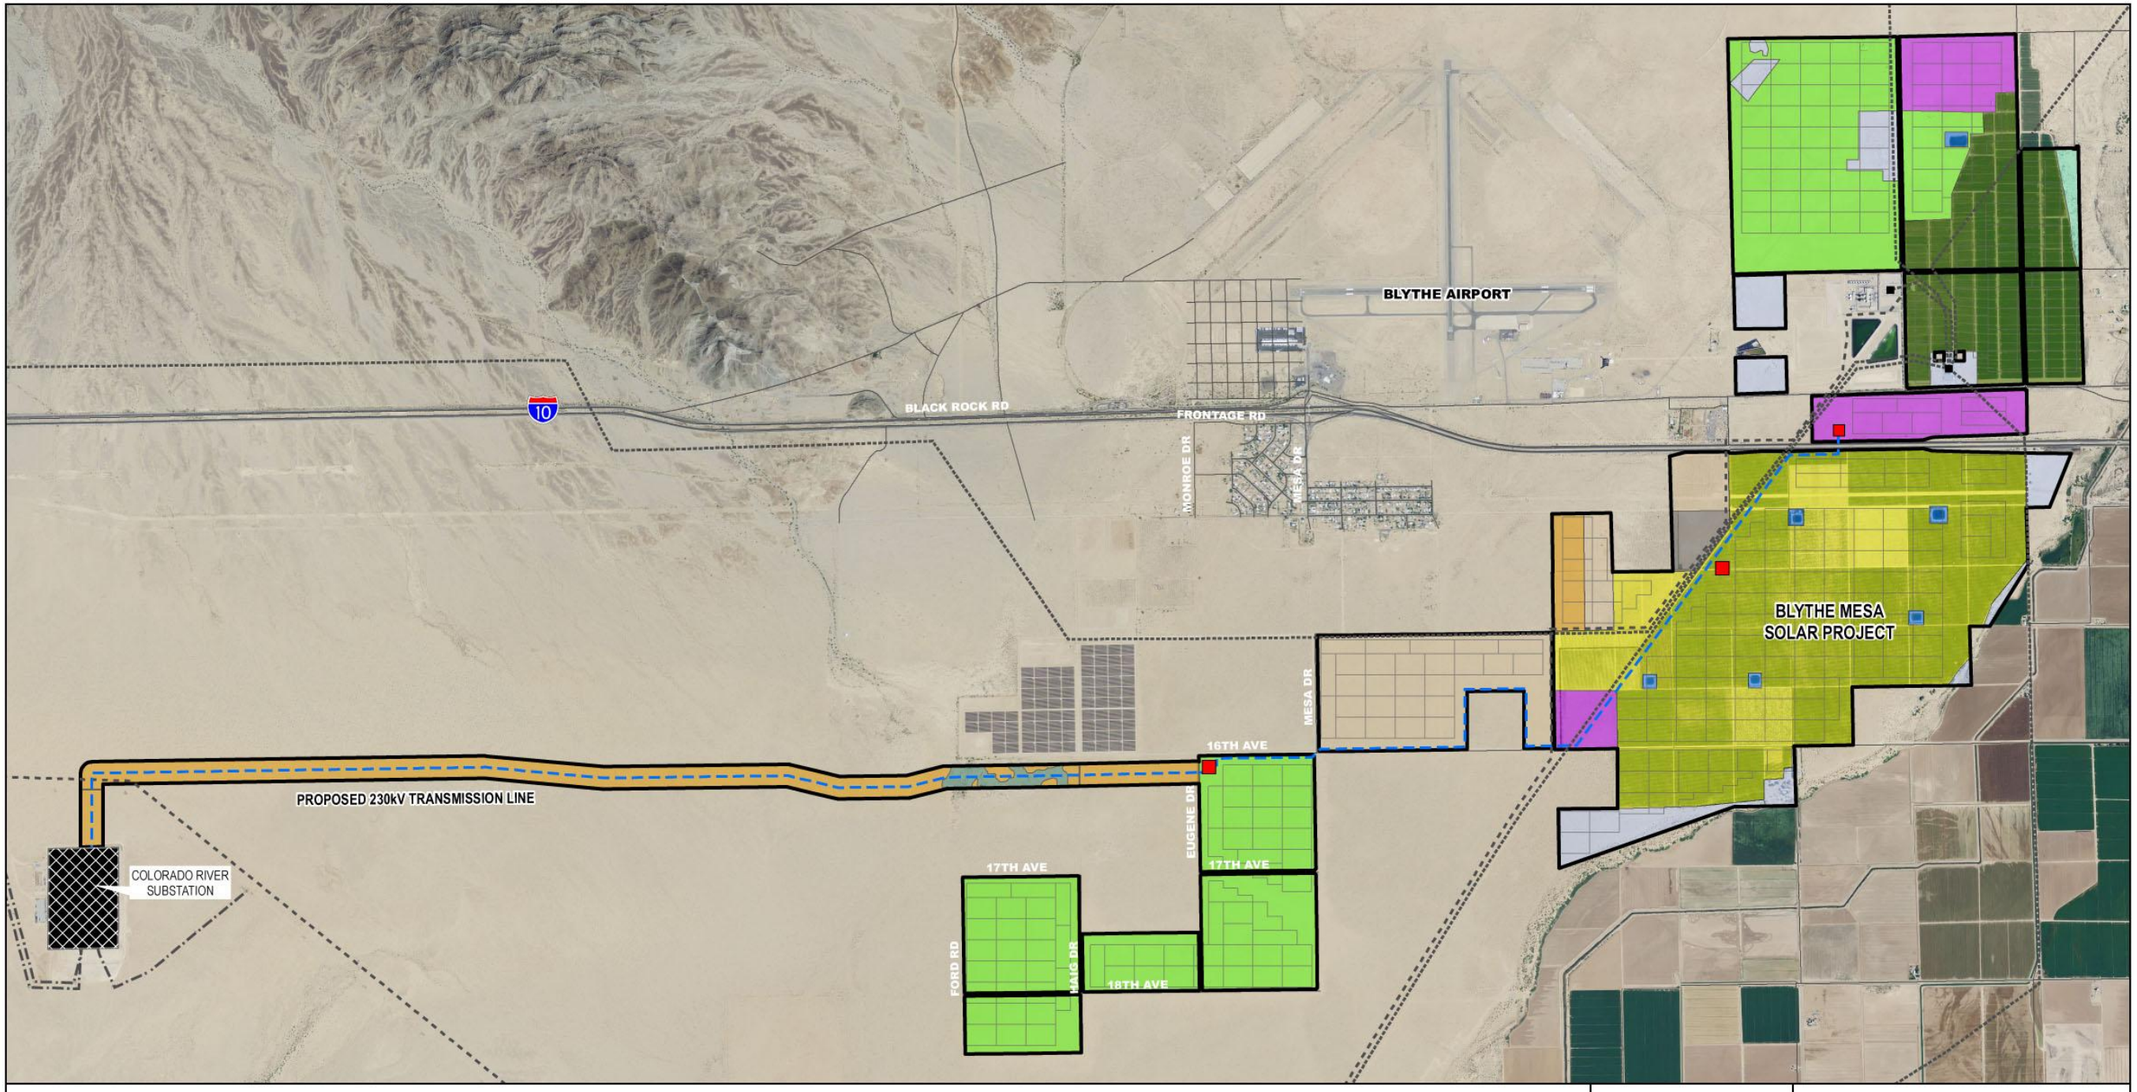
FIGURE 2. VEGETATION COMMUNITIES WITHIN THE PROJECT AREA



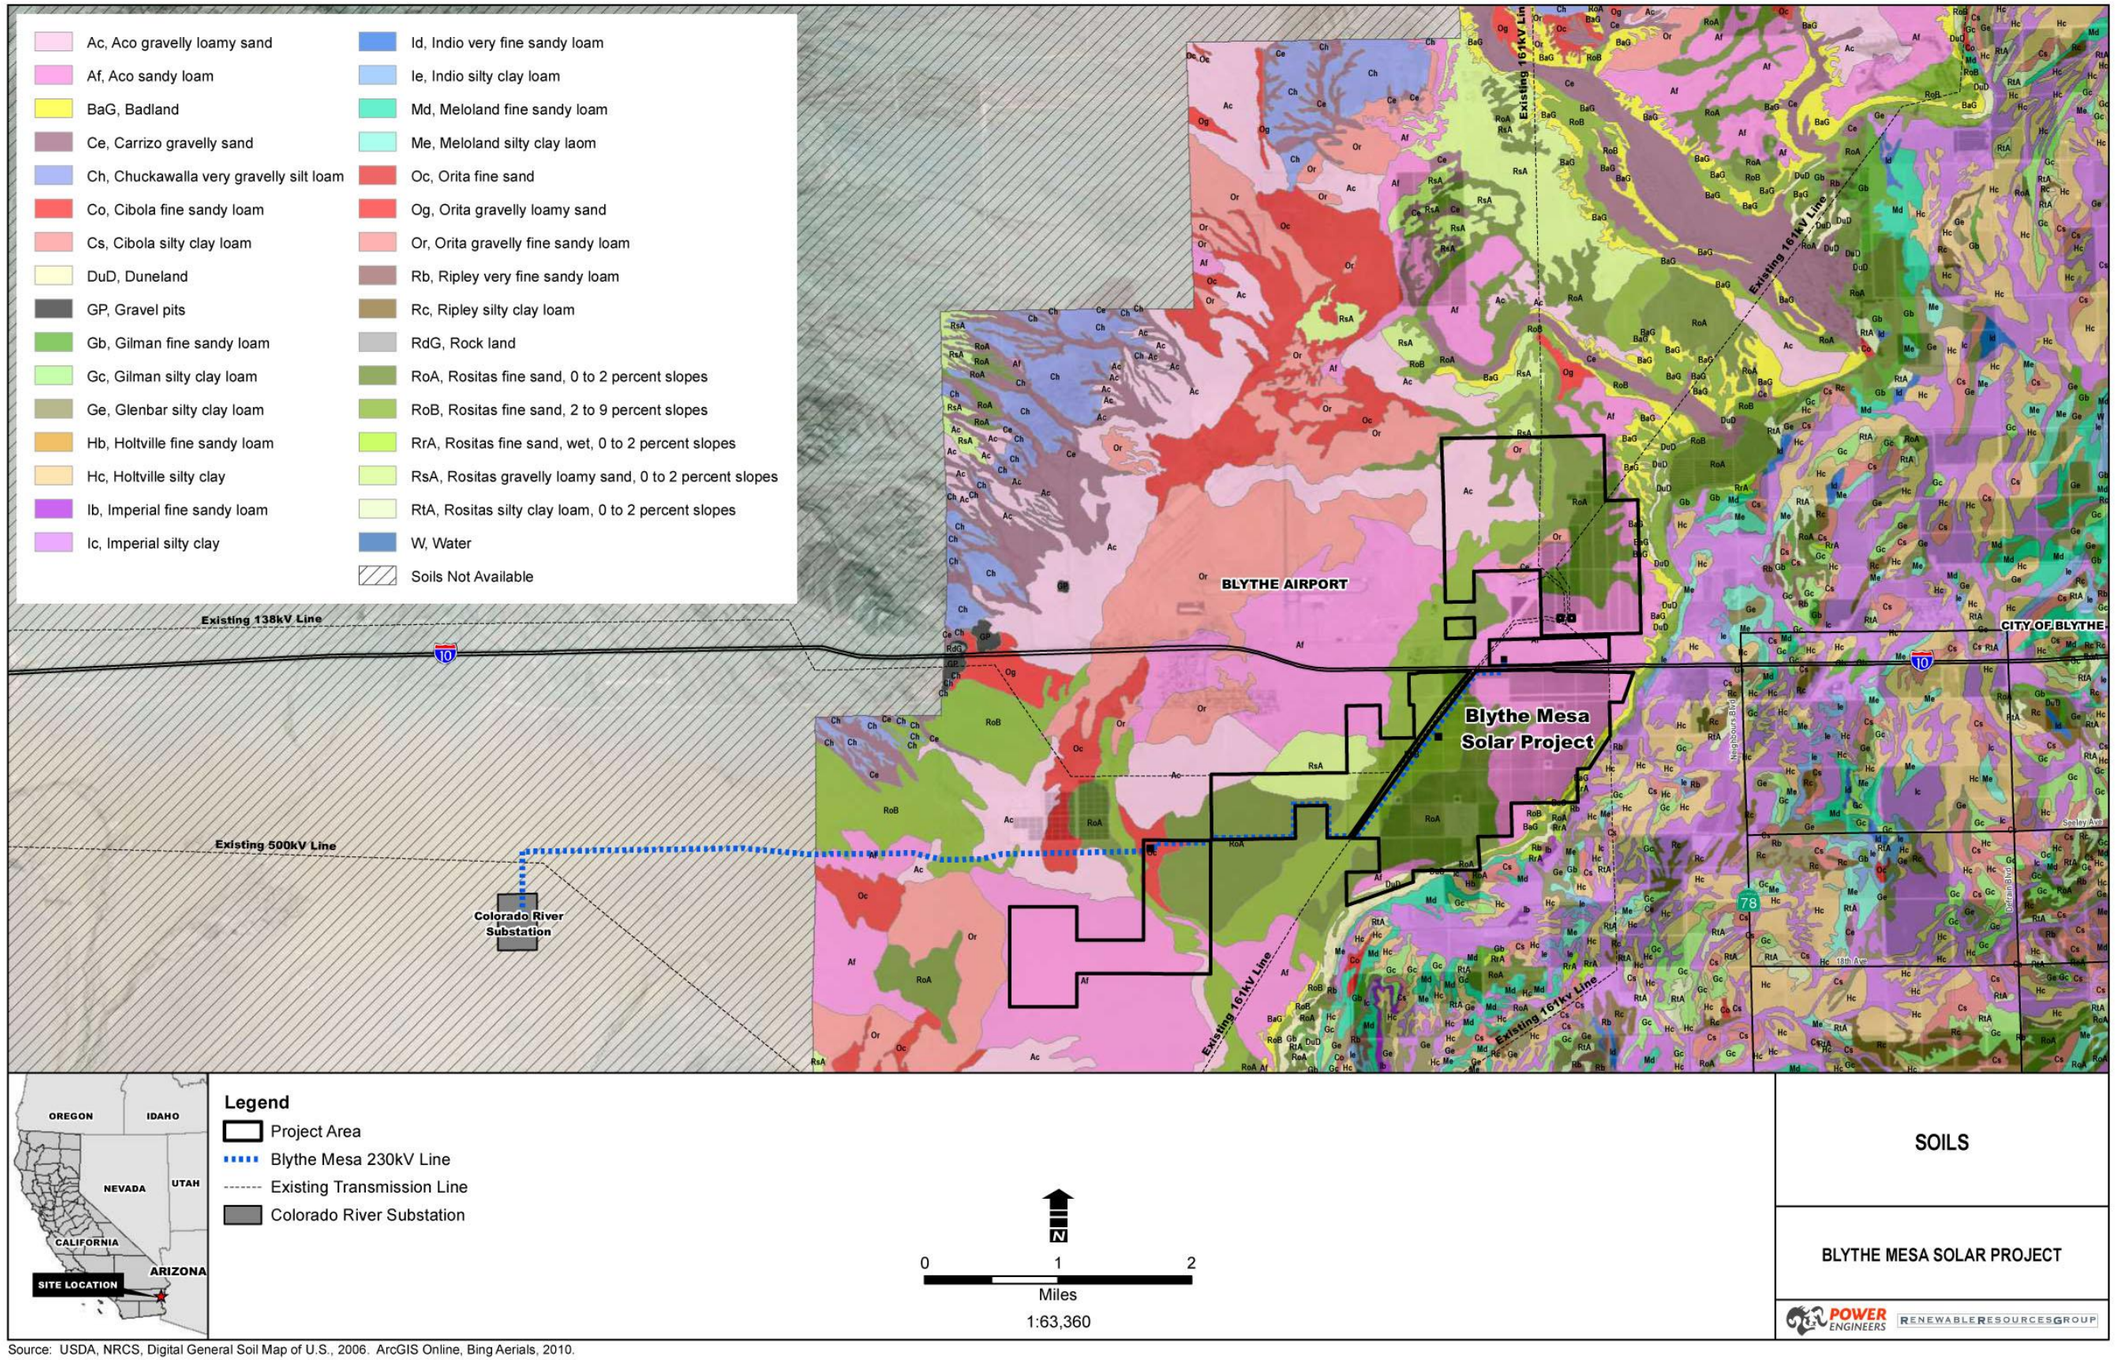


FIGURE 3. SOILS WITHIN THE PROJECT AREA

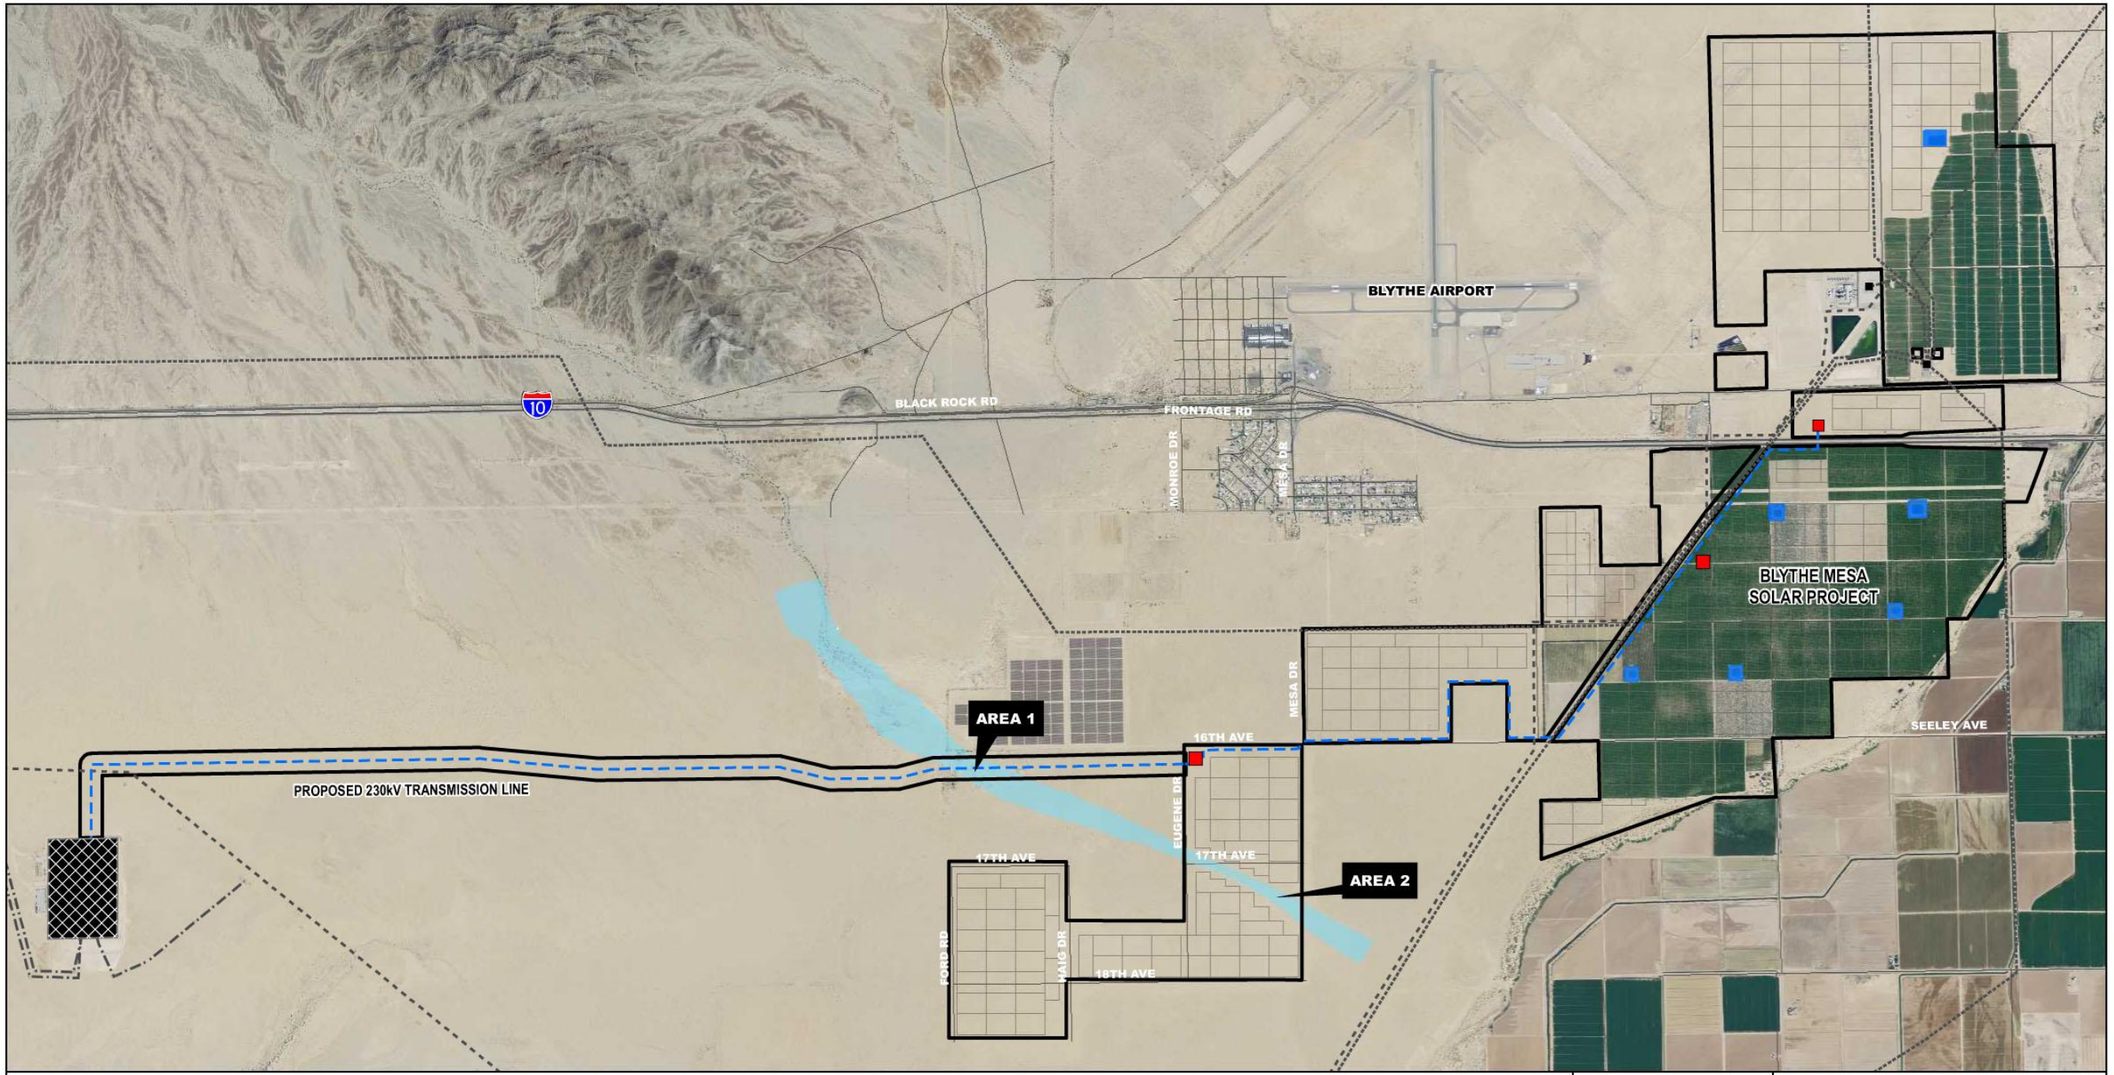
Source: USDA, NRCS, Digital General Soil Map of U.S., 2006. ArcGIS Online, Bing Aerials, 2010.

2.0 METHODS

POWER conducted a field visit within the proposed Project footprint, which focused on a 500-foot-wide corridor centered on the 125-foot-wide Project right-of-way. During POWER's field visit, the portion of the Blythe Mesa project along Mesa Drive, which has been identified as a possible wash feature, was surveyed. This location was the topographic low along Mesa Drive in the vicinity of the wash feature. The photo locations of the pictures taken at this wash feature are shown on Figure 5. The photos taken are shown in Figures 7 through 9. The potential for federal wetlands was evaluated based on the presence of wetland hydrology, wetland vegetation, and hydric soils pursuant to guidance from the Federal Manual for Delineating Wetlands (USACE 1987) as augmented by the USACE (2008b). The Project area does not exhibit features demonstrative of wetland hydrology, wetland vegetation, and/or hydric soils. Therefore, no wetland data points were selected and no wetland datasheets were recorded.



3.0 RESULTS

3.1 Ephemeral Washes

There are two discontinuous ephemeral channels on the project site. The discontinuous ephemeral channel first crosses the transmission line corridor and again southeast across the solar array site (Figure 4 and Figure 6). The discontinuous ephemeral channels on the project site consist of swales and erosional features including gullies and potential small washes characterized by low volume, infrequent or short duration flow. There is an agricultural irrigation ditch running close to the eastern edge of the proposed solar array, but it does not cross the Project area and is approximately 75 to 90 feet below the edge of the Project area. There are several palustrine open-water wetlands (POWs), likely stock ponds, located in a block in an area that is surrounded by the Project east of the Blythe Airport and north of I-10, but there are no POWs within the Project's boundary.

THIS PAGE INTENTIONALLY LEFT BLANK

FIGURE 4. HYDROLOGIC FEATURES

THIS PAGE INTENTIONALLY LEFT BLANK

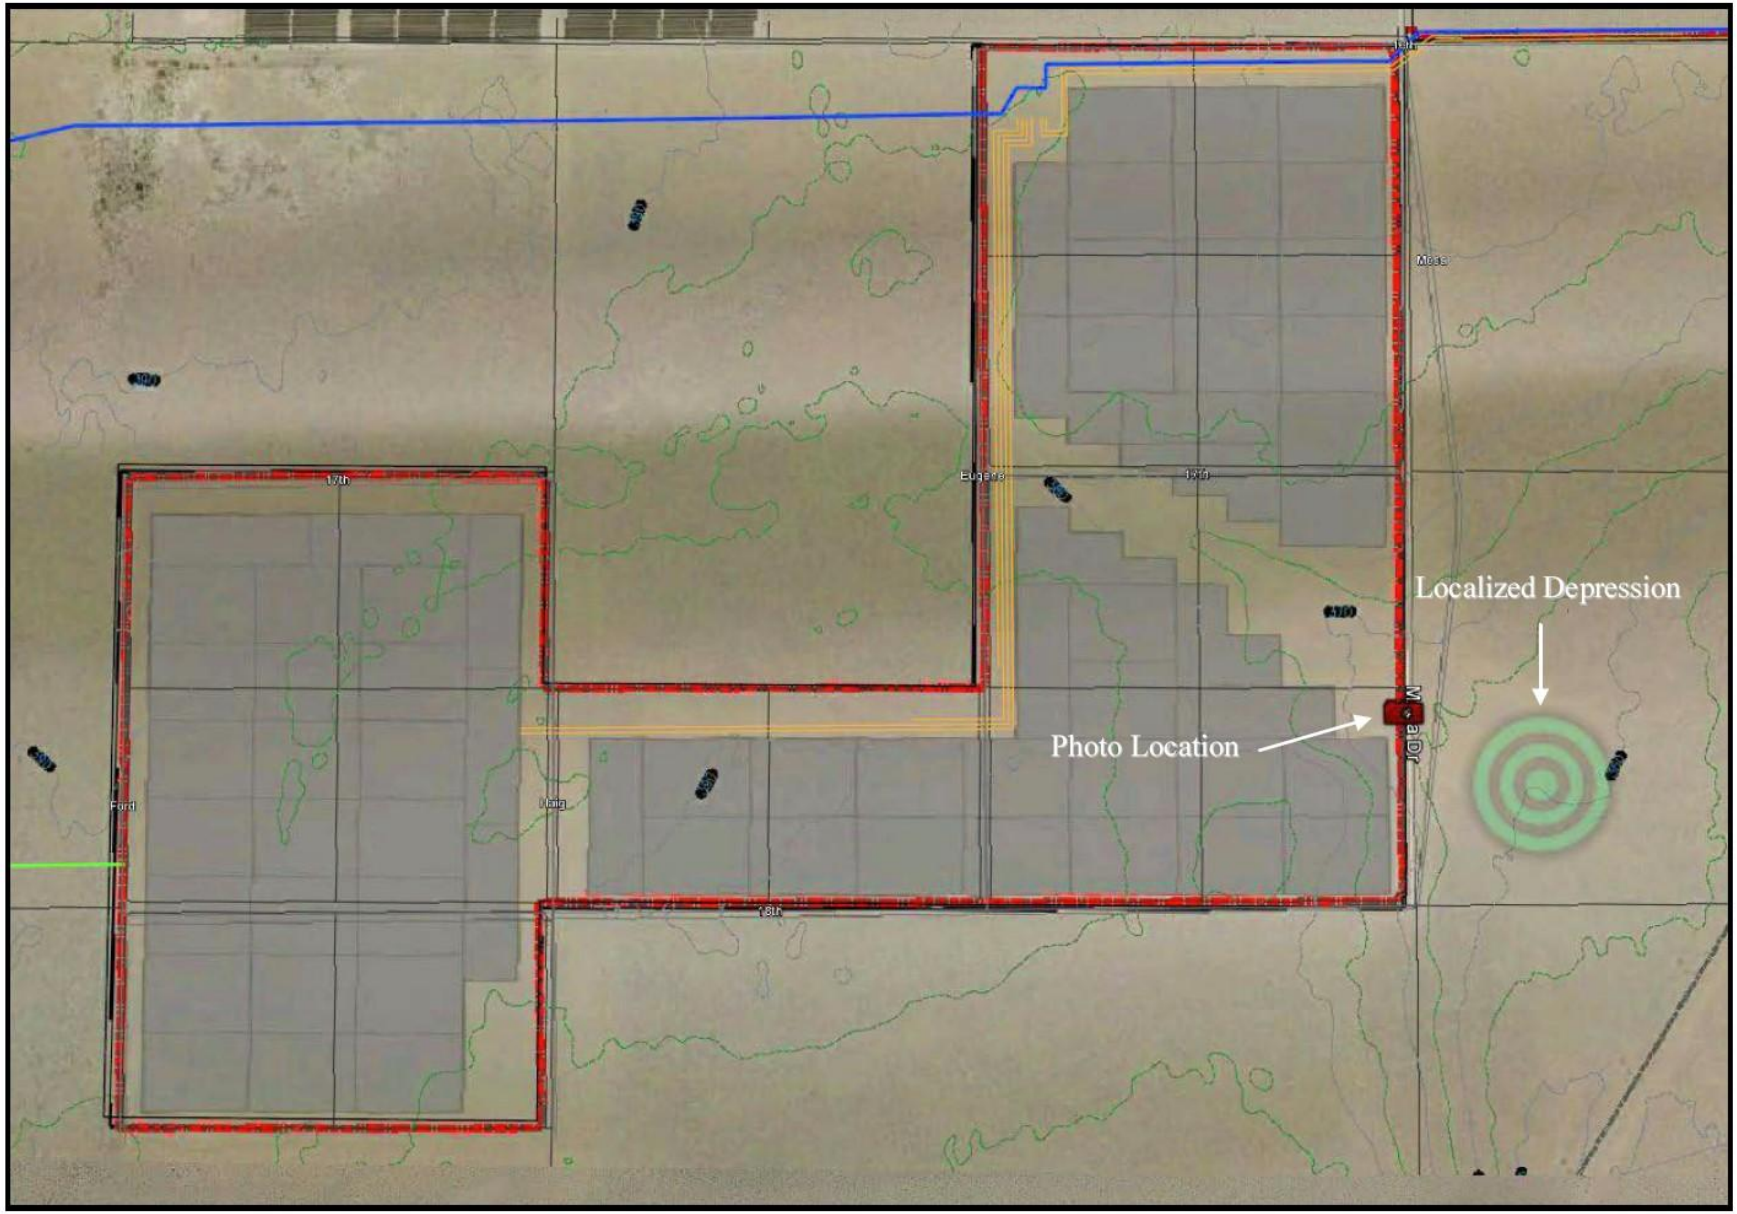
3.2 Summary of Jurisdictional Assessment

Waters of the U.S. are defined as all navigable waters, including all:

- tidal waters
- interstate waters and wetlands
- other waters such as lakes, rivers, streams (perennial or intermittent), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds; the use, degradation, or destruction of which could affect interstate commerce
- impoundments of water mentioned above
- tributaries to waters mentioned above
- territorial seas
- wetlands adjacent to waters mentioned above

Waste treatment systems, including treatment ponds, are not Waters of the U.S. (33 Code of Federal Regulations Section 328.3). Based on the recent guidance issued from USACE Headquarters, jurisdictional Waters of the U.S. include traditional navigable waters (TNWs), all wetlands adjacent to TNWs, non-navigable tributaries of TNWs that are relatively permanent (i.e., tributaries that typically flow year-round or have continuous flow at least seasonally), and wetlands that directly abut such tributaries (USACE 2008b). Additionally, jurisdiction is asserted over water bodies that are not relatively permanent if that body is determined to have a significant nexus with a TNW (USACE 2008b). Under the recent guidance, desert swales defined as "shallow features in the landscape that may convey water across upland areas during and following storm events," and erosional gullies are generally considered non-jurisdictional features because they are not tributaries nor do they have a significant nexus to a TNW (USACE 2008b).

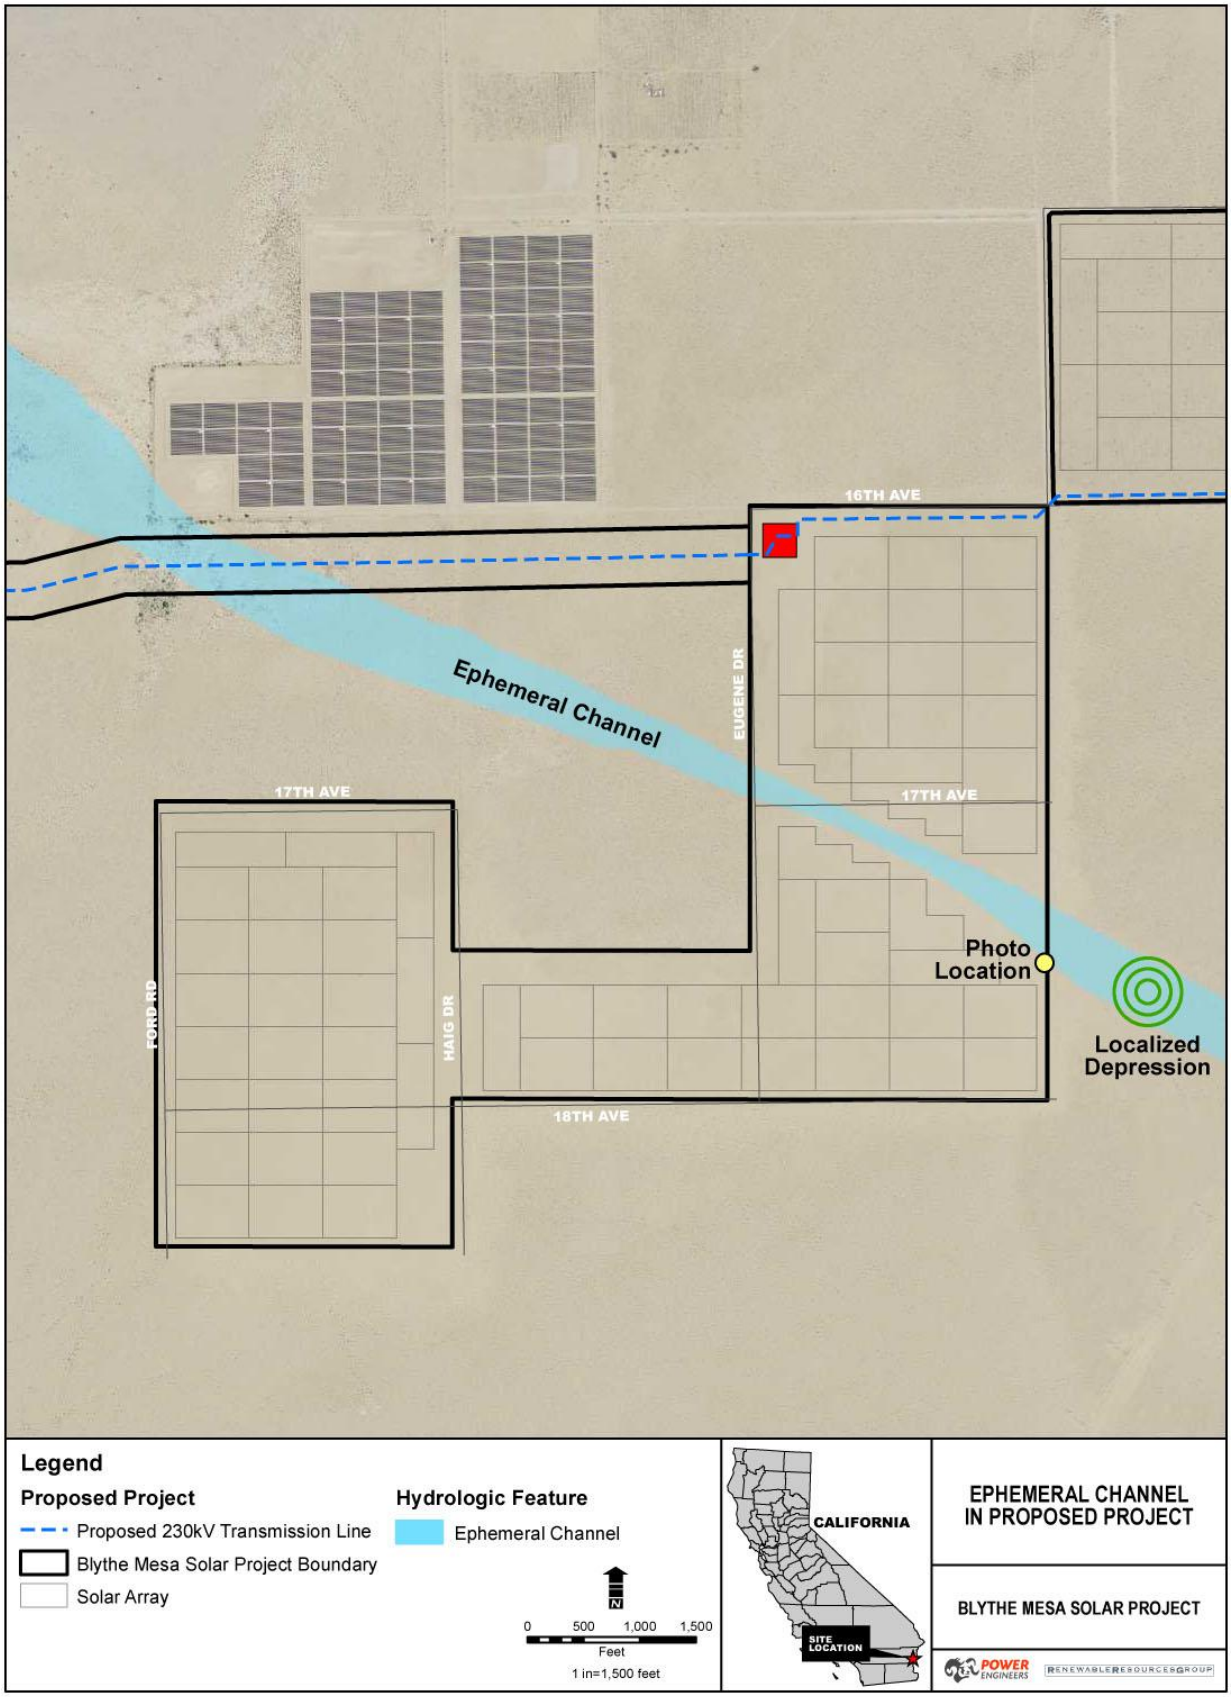
Based on current interpretations of the USACE's jurisdictional authority and the definition of Waters of the U.S., POWER concludes that the two discontinuous ephemeral channels on the Project site do not meet the criteria for regulable waters of the U.S. provided in the USACE Jurisdictional Determination Form Instruction Guidebook. These channels are not traditional navigable waters (TNWs), relatively permanent waters (RPWs), or tributaries to RPWs with seasonal flow or tributaries to non-RPWs. The two discontinuous ephemeral channels do not meet the definition of Waters of the U.S. found at 33 CFR 328.3, including consideration of additional guidance from the USACE:



- There is no evidence that potential waters on site are currently used, were used in the past, or may be used in the future in interstate or foreign commerce.
- These discontinuous ephemeral channels are not interstate waters.
- These discontinuous ephemeral channels are not and cannot be used by interstate or foreign travelers for recreational or other purposes, there are no fish or shellfish, and there is no use or potential use for industrial purpose of such waters for interstate commerce.
- There are no impoundments of waters of the U.S.
- The discontinuous ephemeral channels on site are not tributaries to Waters of the U.S.
- There are no territorial seas or wetlands on the site, or prior converted croplands on the site.

It should be noted that delineation surveys conducted for the Blythe Solar Power Project, which overlaps the Project gen-tie line corridor, did not identify any jurisdictional waters within the overlapping area (AECOM 2010). Also, delineation surveys conducted for the Devers-Palo Verde No. 2 500 kV Transmission Line Project Telecommunications System Route, which runs parallel to the Project gen-tie line corridor and is approximately one mile north and in the same hydrological flow route, did not identify the presence of jurisdictional waters within the area of the Project's gen-tie line corridor (CH2MHill

2010). Therefore, these previous surveys provide further evidence that this specific portion of the Project site is not jurisdictional.



Under the CWA Section 401, every applicant for a federal permit or license for any activity which may result in a discharge to a water body must obtain State Water Quality Certification (Certification) that the proposed activity will comply with state water quality standards. Most Certifications are issued in connection with USACE CWA Section 404 permits; however the RWQB regulates isolated waters under Section 401(c) of the federal CWA as Waters of the State despite the USACE lack of authority, and a 401 Certification could be required.

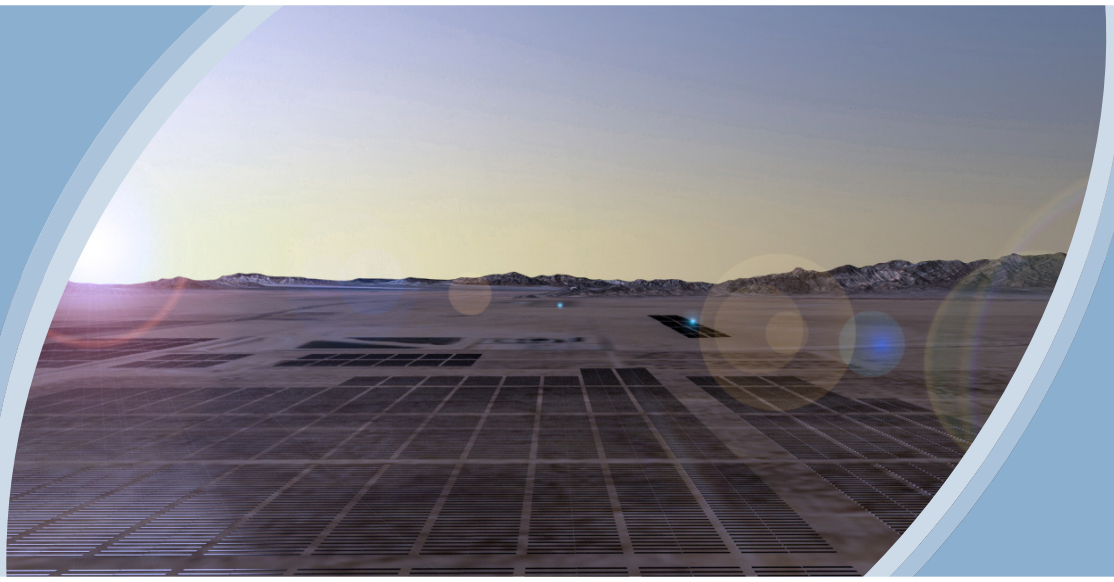
APPENDIX A: BEST MANAGEMENT PRACTICES

The Best Management Practices (BMPs) listed below would minimize or avoid the environmental impacts associated with the proposed Project. These BMPs differ from mitigation measures, because BMPs are: 1) requirements of existing policies, practices, and measures required by law, regulation, or local policy; 2) ongoing, regularly occurring practices; and 3) not specific to this proposed Project.



BMP	Description
BMP-1	**Drainage, Erosion, and Sedimentation Control Plan**. As part of the County of Riverside's Conditional Use Permit (CUP) requirements, a Drainage, Erosion, and Sedimentation Control Plan would be developed for the Project. The plan would address the drainage, erosion, and sediment control requirements to support all activities associated with construction, operation, and decommissioning of the Project. For example, any stockpiles created would be kept on site, with an upslope barrier in place to divert runoff. Stockpiles would be sprayed with water, covered with tarpaulins, and/or treated with appropriate dust suppressants, especially in preparation for high wind or storm conditions. Certified weed-free straw bale barriers would be installed to control sediment in runoff water; straw bale barriers would be installed only where sediment-laden water can pond, thus allowing the sediment to settle out. Topsoil from the site would be stripped, stockpiled, and stabilized before excavating earth for facility construction. Topsoil would be segregated and spread on freshly disturbed areas to reduce color contrast and aid rapid revegetation.
BMP-2	**Stormwater Pollution Prevention Plan.** In compliance with requirements of the National Pollutant Discharge Elimination System (NPDES) permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and prepared for the Project to ensure that protection of water quality and soil resources is consistent with County and State regulations. The plan would identify site surface water runoff patterns and include measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Project site and Project-related construction areas, and would also include measures for non-stormwater discharge and waste management. The SWPPP would cover all activities associated with the construction of the Project, including clearing, grading, and other ground disturbance such as stockpiling or excavation erosion control. The plan would prevent off-site migration of contaminated stormwater, changes in pre-Project storm hydrographs, or increased soil erosion.
BMP-3	**Fugitive Dust Abatement Plan.** As required by the Mojave Desert Air Quality Management District Rule 403, a Fugitive Dust Abatement Plan would be prepared to address fugitive dust emissions during Project construction, operation, and decommissioning. The plan would include measures to minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land, and solid waste disposal operations, and would take every reasonable precaution to prevent visible particulate matter from being deposited upon public roadways as a direct result of operations. During construction, all unpaved roads, disturbed areas (e.g., areas of scraping, excavation, backfilling, grading, and compacting), and loose materials generated during Project construction activities would be watered as frequently as necessary to minimize fugitive dust generation. In water-deprived locations, water spraying would be limited to active disturbance areas only, and non-water-based dust control measures would be implemented in areas with intermittent use or use that is not heavy, such as stockpiles or access roads. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers could be used. The dust suppression measures would consider the sensitivity of wildlife to the windborne dispersal of fugitive dust containing dust suppressants and the potential impact on future reclamation.
BMP-4	**Fire Management and Protection Plan.** As required by existing law (Title 8 California Code of Regulations [CCR] Section 3221), a Fire Management and Protection Plan would be developed in consultation with the Riverside County Fire Department to identify potential hazards and accident scenarios that would exist at the facility during construction, operation, and decommissioning of the Project. The Plan would include the identification of the following: potential fire hazards and ignition sources; proper handling and storage of potential fire hazards; control of potential ignition sources; persons responsible for equipment and systems maintenance; location of portable fire extinguishers; automatic sprinkler fire suppression system; water-spray fire system; coordination with local fire department; and recordkeeping requirements.

BMP	Description
BMP-5	**Emergency Action Plan.** As required by Title 8 CCR Section 3220, the Project would develop a site-specific operations phase Emergency Action Plan. The operations Emergency Action Plan would address potential emergency situations requiring emergency response and/or planned evacuation. The plan would describe accident scenarios, evacuation routes, alarm systems, points of contact, assembly areas, responsibilities, and other actions to be taken in the event of an emergency. In particular, the plan would describe arrangements with local emergency response agencies.
BMP-6	**Lighting Plan.** A lighting plan would be prepared that documents how lighting will be designed and installed to minimize night-sky impacts during facility construction and operations. Lighting for facilities will not exceed the minimum number of lights and brightness required for safety and security and will not cause excessive reflected glare. Light fixtures will not spill light beyond the Project boundary. Where feasible, vehicle-mounted lights will be used for night maintenance activities. Wherever feasible, consistent with safety and security, lighting will be kept off when not in use. The lighting plan will include a process for promptly addressing complaints about lighting.
BMP-7	**Trash Abatement Plan**. A Trash Abatement Plan shall be developed that focuses on containing trash and food in closed and secure sealable containers, with lids that latch, and removing them periodically to reduce their attractiveness to opportunistic species, such as common ravens, coyotes, and feral dogs, that could serve as predators of native wildlife and special-status animals. The Plan would also establish a regular litter pick-up procedure within and around the perimeter of the Project site, and removal of construction-related trash containers from the Project site when construction is complete.
BMP-8	**Cleanup and Restoration.** Upon completion of construction activities, all unused materials and equipment shall be removed from the Project site. All construction equipment and refuse including, but not limited to, wrapping material, cables, cords, wire, boxes, rope, broken equipment parts, twine, strapping, buckets, and metal or plastic containers shall be removed from the site and disposed of properly after completion of construction. Any unused or leftover hazardous products shall be properly disposed of off-site.
BMP-9	**Hazardous materials.** As required by the Clean Air Act, Section 401 of the Clean Water Act, the Toxic Substance Control Act, and the Hazardous Materials Transportation Act, all vehicles and equipment must be in proper working condition to ensure that there is no potential for fugitive emissions or accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, or other hazardous materials. Equipment must be checked for leaks prior to operation and repaired as necessary. Refueling of equipment must take place on existing paved roads, where possible, and not within or adjacent to drainages. Hazardous spills must be cleaned up immediately. Contaminated soil would be disposed of at an approved offsite landfill, and spills reported to the permitting agencies. Service/maintenance vehicles should carry appropriate equipment and materials to isolate and remediate leaks or spills, and an on-site spill containment kit for fueling, maintenance, and construction will be available. Cleaning of construction vehicles at commercial car washes should be considered rather than washing vehicles on the Project site so that dirt, grease, and detergents are treated effectively at existing facilities designed to handle those types of wastes.
BMP-10	**Integrated Weed Management Plan.** In compliance with the Federal Noxious Weed Act, the Plant Protection Act, and the California Food and Agricultural Code, a Project-specific integrated weed management plan for the control of noxious weeds and invasive plant species would be prepared. The plan would identify presence, location, and abundance of weed species in the Project area and surrounding area adjacent to the Project, as well as identify suppression and containment measures to prevent the spread of weed species and introduction of weed species. Prevention techniques would include: limiting disturbance areas during construction to the minimum required to perform work; limiting ingress and egress to defined routes; maintaining vehicle wash and inspection stations; and closely monitoring the types of materials brought on site to minimize the potential for weed introduction. During operations, noxious and invasive weed management will be incorporated as a part of mandatory site training for groundskeepers and maintenance personnel. Training will include weed identification and the impacts on agriculture, wildlife, and fire frequencies. Training will also cover the importance of preventing the spread of noxious weeds and of controlling the proliferation of existing weeds.

BMP	Description
BMP-11	**Project structures and building surfaces.** Project facilities would be sited to ensure that there is adequate space (i.e., setbacks of no less than 100 feet) between solar facilities and natural washes. These setbacks would preserve and maintain the natural washes' hydrological functions. The color and finish of Project structure and building surfaces that are visible to the public will be designed to ensure minimal visual intrusion, contrast, and glare. Grouped structures will be painted the same color to reduce visual complexity and color contrast. Solar panel backs will be color-treated to reduce visual contrast with the landscape setting. Materials, coatings, or paints having little or no reflectivity will be used wherever possible. The visual color contrast of graveled surfaces will be reduced with approved color treatment practices.
BMP-12	**Gen-tie lines.** Gen-tie line support structures and other facility structures shall be designed to discourage their use by raptors for perching or nesting (e.g., by use of anti-perching devices). This design would also reduce the potential for increased predation of special-status species, such as the desert tortoise. Mechanisms to visually warn birds (permanent markers or bird flight diverters) shall be placed on gen-tie lines at regular intervals to prevent birds from colliding with the lines. To the extent practicable, the use of guy wires shall be avoided because they pose a collision hazard for birds and bats. Necessary guy wires shall be clearly marked with bird flight diverters to reduce the probability of collision. Shield wires shall be marked with devices that have been scientifically tested and found to significantly reduce the potential for bird collisions. Gen-tie lines shall utilize non-specular conductors and non-reflective coatings on insulators.
BMP-13	**Ground and surface disturbance.** Construction boundaries would be clearly delineated to minimize areas of ground and surface disturbance. Ground-disturbing activities shall be minimized, especially during the rainy season. To the maximum extent possible, construction-related activities (such as vehicle and foot traffic) would avoid areas with intact biological soil crusts. For cases in which impacts cannot be avoided, soil crusts would be salvaged and restored on the basis of recommendations by the County of Riverside and BLM once construction has been completed. Existing rocks, vegetation, and drainage patterns shall be preserved to the maximum extent possible. No paint or permanent discoloring agents shall be applied to rocks or vegetation (to indicate surveyor construction activity limits or for any other purpose). All stakes and flagging shall be removed from the construction area and disposed of in an approved facility. Where feasible, brush-beating, mowing, or use of protective surface matting rather than removing vegetation shall be employed. Clearing and disturbing of sensitive areas (e.g., steep slopes and natural drainages) and other areas shall be avoided outside the construction zone. Surface disturbance would be minimized by utilizing undulating surface disturbance edges; stripping, salvaging, and replacing topsoil; using contoured grading; controlling erosion; using dust suppression techniques; and restoring exposed soils to their original contour and vegetation.
BMP-14	**Travel and traffic.** Vehicular traffic on site shall be confined to existing or designated travel routes and designated work areas. Access to the construction site and staging areas shall be limited to authorized vehicles and only through the designated roads. The extent of habitat disturbance during construction shall be reduced by keeping vehicles on access roads and minimizing foot and vehicle traffic through undisturbed areas. To the extent practical, travel shall be limited to stabilized roads. Road maintenance activities shall avoid blading existing forbs and grasses in ditches and adjacent to roads. Abandoned roads and roads no longer needed shall be subsoiled to increase infiltration and reduce soil compaction, then recontoured and revegetated. Construction traffic shall avoid unpaved surfaces to the extent practical (to reduce the risk of compaction) and reduce speed to lessen fugitive dust emissions. On unpaved or unstabilized surfaces within the construction site, speed limits (e.g., 20 mph) shall be posted with visible signs and enforced to minimize airborne fugitive dust. Project vehicle speeds shall be limited in areas occupied by special-status animal species. Traffic shall stop to allow wildlife to cross roads. Shuttle vans or carpooling shall be used where feasible to reduce the amount of traffic on access roads. Workers shall be trained to comply with the speed limit, use good engineering practices, minimize the drop height of materials, and minimize the number and extent of disturbed areas. The Project developer shall enforce these requirements.

BMP	Description
BMP-15	**New access roads and parking lots.** New access roads shall be designed and constructed to the appropriate road design standards, such as those described in BLM Manual 9113 or County standards, whichever is applicable. New access roads shall be designed to follow natural land contours in the Project area and avoid existing desert washes. The specifications and codes developed by the U.S. Department of Transportation (DOT) are also to be taken into account. Primary access roads and parking lots shall be surfaced with aggregate that is hard enough that vehicles cannot crush it and thus cause dust or compacted soil conditions. Paving may also be used on access roads and parking lots. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers would be used on these locations.
BMP-16	**Diesel engines.** All diesel engines used in the facility would be fueled only with ultra-low sulfur diesel with a sulfur content of 15 parts per million (ppm) or less. The Project would require use of construction diesel engines with a rating of 50 horsepower (hp) or higher that meet, at a minimum, the Tier 3 California Emission Standards for Off-Road Compression Ignition Engines, as specified in the California Code of Regulations, Title 13, Section 2423(b)(1), unless such engines are not available. If a Tier 3 engine is not available for off-road equipment larger than 100 hp, a Tier 2 engine, or an engine equipped with retrofit controls to reduce exhaust emissions of nitrogen oxides (NO_x) and diesel particulate matter (DPM) to no more than Tier 2 levels, may be used. Regulatory agencies may determine that use of such devices is not practical when: • There is no available retrofit control device verified by either the California Air Resources Board (CARB) or the U.S. Environmental Protection Agency (EPA) to control engines in question to Tier 2 equivalent emission levels and the retrofitted or Tier 1 engines use the highest level of available control technology. • The construction equipment is intended to be on site for five days or less. • It can be demonstrated there is a good faith effort to comply with the recommendation and that compliance is not practical. The idling time of diesel equipment would be limited to no more than 10 minutes, unless idling must be maintained for proper operation (e.g., drilling, hoisting, and trenching).
BMP-17	**High wind conditions.** In compliance with MDAQMD Rule 403 criteria, all soil-disturbing activities and travel on unpaved roads must be suspended during periods of high winds. A 25 mph wind speed has been determined on the basis of soil properties identified during site characterization. Monitoring of the wind speed would be required at the site during construction, operation, and decommissioning.
BMP-18	**Noise.** The Project would minimize construction- and operation-related noise levels to minimize impacts to wildlife and nearby residents.
BMP-19	**Plants and wildlife.** In compliance with the California Department of Fish and Game Codes, while on the Project property, workers or visitors would be prohibited from: feeding wildlife; moving live, injured, or dead wildlife off roads, ROWs, or the Project site; bringing domestic pets to the Project site; collecting native plants; and harassing wildlife. Areas where wildlife could hide or be trapped (e.g., open trenches, sheds, pits, uncovered basins, and laydown areas) would be minimized. For example, an uncovered pipe that has been placed in a trench should be capped at the end of each workday to prevent animals from entering the pipe. If a special-status species is discovered inside a component, that component must not be moved, or, if necessary, moved only to remove the animal from the path of activity, until the animal has escaped. As open trenches could impede the seasonal movements of large game animals and alter their distribution, they would be backfilled as quickly as possible. Open trenches could also entrap smaller animals; therefore, escape ramps would be installed along open trench segments at distances identified in the applicable land use plan or by the best available information and science. If traffic is being unreasonably delayed by wildlife in roads, personnel would contact the Project biologist, who will take any necessary action. Any vehicle-wildlife collisions would be immediately reported to the Project biologist. Observations of potential wildlife problems, including wildlife mortality, would be immediately reported to the BLM or other appropriate agency authorized officer.

Page i, fifth paragraph, last sentence	Change the sentence to: "In addition, two archaeological sites (P-33-019998 and P-33-020002) and two isolated finds (P-33-020018 and P-33-020019) were identified in an area that was later excluded from the APE."
Appendix E-	Add to the table: APN 863100005

Riverside County Requirements. Table "Parcels within the Solar Field"	
Page 11, Section 2.3.1, first paragraph	Replace discussion of Riverside County General Plan policies with the following: "Cultural Resources: The Multipurpose Open Space Element of the Riverside County General Plan (amended March 22, 2011) outlines policies intended to promote the preservation of cultural resources in the County of Riverside, as follows: **OS 19.2** -The County of Riverside shall establish a cultural resources program in consultation with Tribes and the professional cultural resources consulting community. Such a program shall, at a minimum, address each of the following: application processing requirements; information database (s); confidentiality of site locations; content and review of technical studies; professional consultant qualifications and requirements; site monitoring; examples of preservation and mitigation techniques and methods; and the descendant community consultation requirements of local, state, and federal law. (AI-A) **OS 19.3-** Review proposed development for the possibility of cultural resources and for compliance with the cultural resources program. **OS 19.4**- To the extent feasible designate as open space and allocate resources and/or tax credits to prioritize the protection of cultural resources preserved in place or left in an undisturbed state, (AI-B) **OS 19.5**- Exercise sensitivity and respect for human remains form both prehistoric and historic time periods and comply with all applicable laws concerning such remains."
Page 45, fifth paragraph	Add the following text: The four identified areas correspond to clusters of buildings shown on the BAAB map from the 1940s. Smaller features observed in the field (e.g., fire hydrants) were not shown on the map, nor where artifact clusters identified in the field. A radio tower is shown on the BAAB map, but no evidence of this structure was seen during the surface survey in 2011. The tower could have been removed in the past, or the map may show the tower in an incorrect location. A sewage pond is shown on the USGS map about 200 meters southeast of Cluster 3. A likely sewage pond is also shown at this location on an aerial photograph from 1943 (Wilson 2008). The general shape of the sewage pond can be seen on modern aerial photographs, but there is also visible evidence in these photographs of extensive earth moving in the vicinity. In 2011, POWER archaeologists did not identify any artifacts or features at this location. Because only a small portion of the sewage pond would have extended into the survey area, it is possible that evidence of the pond still exists outside the Project boundary.
Page 27, first paragraph, first sentence	Replace with the following: "POWER archaeologist, Gini Austerman, conducted a records search at the Eastern Information Center (EIC), housed at the University of California, Riverside (UCR), on April 7, 2011."

Page 27, second paragraph	Add the following text: "POWER conducted a BLM Class III archaeological and historic built environment survey of 3,660 acres of lands within the Project boundary that include the 125-foot ROW of the proposed 230 kV transmission line. These lands included private and BLM-managed public lands. The survey crew consisted of Dan Woodward, Trish Webb, Johanna Marty, April Shand, Reilly Murphy, Joshua Garr, Stacey Stanley, and Sam Smith. During the surveys, archaeologists walked parallel transects, using 15-meter (50-foot) intervals, to identify archaeological and architectural resources within or adjacent to the APE."
Page 27, last paragraph, Native American Communication	Add the following text: "In April 2011, POWER sent a letter to the NAHC requesting information regarding Native American groups with historic ties to, and interest in, the proposed Project area. The NAHC conducted a Sacred Lands search to determine if there are any sacred sites within the project area. On April 15, 2011 the NAHC recommended that additional information be requested from a list of Native American contacts the NAHC provided. In May 2011, 20 letters were sent to the tribes identified by the NAHC, which are listed in Table 4. The letter provided a brief description of the proposed Project and requested information concerning Native American cultural resources in the Project area, as well as any comments or concerns about the Project."
Page 37, Table 7	Add to the bottom of table: "*All resources are on private land."
Page 40, last paragraph	Replace with the following text: "P-33-012532 is a transmission line constructed between the 1940s and 1950s. It is still in use and has been subject to various upgrades. There is no indication that this resource is associated with events that have made a significant contribution to the broad patterns of history (Criterion A of the NRHP/Criterion 1 of the CRHR), or associated with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This architectural resource does not embody distinctive characteristics of a type, period, or method of construction; the work of a master; or possess high artistic value (NHRP Criterion C/CRHR Criterion 3). Nor does this resource meet NRHP Criterion 4/CRHR Criterion D for containing important scientific or historical data. Therefore, POWER agrees with previous researchers and recommends that P-33-012532, the Niland-Blythe 161 kV Transmission Line, is not eligible for listing in either the NRHP or the CRHR."
Pages 39, 40	Move the caption "FIGURE 6. P-33-009186. SITE OVERVIEW, NORTH OF RIVERSIDE AVENUE, FACING EAST" from page 40 to page 39.
Pages40, 41	Move the caption "FIGURE 7. P-33-012532. NILAND-BLYTHE 161 KV TRANSMISSION LINE" from page 41 to page 40.
Page 41, third paragraph	Replace with: "P-33-014083 is a transmission line constructed in the 1940s. This resource is still in use and has been modified by various upgrades. There is no indication that this resource is associated with events that have made a significant contribution to the broad patterns of history (Criterion A of the NRHP/Criterion 1 of the CRHR), or is associated with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This architectural resource does not embody distinctive characteristics of a type, period, or method of construction; the work of a master; or possess high artistic value (NHRP Criterion C/CRHR Criterion 3). Nor does this resource meet the criteria for NRHP Criterion 4/CRHR Criterion D for containing scientific or historical data. POWER recommends that the transmission line does not meet the criteria for the CRHR or the NRHP and therefore is not eligible for listing."

Page 47, third paragraph	Add the following paragraph: In addition to assessing integrity, POWER evaluated the eligibility of each of the areas by considering the buildings' association with General Patton and with the DTC/C-AMA. At the County archaeologist's recommendation, each of the clusters is considered a contributing element within the Blythe Army Air Base Historic District.
Page 46, second paragraph	Change the following text: "BAAB's association with the DTC lasted less than a year, and its association with General Patton was even briefer, only five months. The barracks, warehouses, fire station, utility building, and hospital within the Project APE were ~~for the most part~~ built and used after BAAB's ties to the DTC and General Patton ended. Nonetheless, BAAB's support for desert training missions continued until 1944. POWER agrees the Blythe Army Air Base Historic District (P-33-018837), including the portion with the APE, is associated with events that have made a significant impact on broad patterns of history (NRHP Criterion A/CRHR Criterion 1). While BAAB as a whole has ties to General Patton and therefore with the life of a significant person (NRHP Criterion B/CRHR Criterion 2), Patton's association with the portion of BAAB in the Project APE is very limited to non-existent.
Page 46, third paragraph	Insert the following text: "After several discussions and a site visit with the Riverside County Archaeologist on November 11, 2011, POWER recommends that despite the limited physical integrity of the features within the Project APE, the portion of BAAB falling within the current Project boundaries contain contributing elements and are, like the historic district, recommended eligible to the NRHP and CRHR."
Page 64, second paragraph	Insert the following text: "The utility shop is still standing, but its entire exterior has been modified. The exact dates of construction are unknown; however it was most likely built in late 1942. The Utility Shop and Yard are shown just north of the Hospital building on a historic aerial photo dating to 1943 (Wilson 2008). POWER's evaluation of this building finds that while integrity of location is maintained, integrity of design, materials, and workmanship has been lost. Integrity of setting has been diminished by the removal of most other physical features of the military base."
Page 65, first paragraph, last sentence	Insert the following text: "In addition, two archaeological sites (P-33-019998 and P-33-020002) and two isolated finds (P-33-020018 and P-33-020019) were identified in an area that was later excluded from the APE."
Page 39, first paragraph, second sentence.	Insert the following text: "A large quantity of historic debris included predominantly food cans and miscellaneous metal pieces (n = 200 to 1000). The surface material in the current Project area extends 3 meters north of the road and spans 30 meters east/west. A larger portion of the site extends into the power plant property on the south side of Riverside Avenue outside the Project APE, where thousands of cans are visible. Construction of the road and power plant has disturbed the site."
Page 48, last paragraph, second and third sentences.	Insert the following text: "Concentration 1 contains 15 cans and one bottle in a 5-by-5-meter area. Concentration 2 covers a 10-by-5-meter area 15 to 20 meters north of Concentration 1, and contains approximately 50 artifacts."
Page 56, first paragraph, first sentence.	Insert the following text: "P-33-020000 (Figure 23) is a sparse historic refuse scatter mixed with modern debris, containing approximately 30 artifacts.

MANAGEMENT SUMMARY

Solar Star Blythe Mesa 1, LLC (SSBM) and its development representative Renewable Resources Group (RRG) propose to develop the Blythe Mesa Solar Project (Project), a 485 megawatt (MW) solar photovoltaic electrical generation facility in Riverside County, California. The Project involves the construction and operation of the generation facility and associated infrastructure, which includes substations, maintenance facilities, access routes, and a 230 kilovolt (kV) transmission line that will interconnect the generation facility to the statewide electrical transmission grid through the Colorado River Substation. SSBM and RRG requested that POWER Engineers, Inc. (POWER) conduct an archaeological resource and historic built environment inventory of 3,660 acres for the proposed solar facility and transmission line right-of-way (ROW). This survey report describes the results of surveys on both public and private land. Two alternatives transmission line corridors are addressed in a separate report (POWER 2012).

The proposed solar facility would be entirely on private land; the proposed transmission line would cross public land managed by the Bureau of Land Management (BLM), Palm Springs-South Coast Field Office. Because of the proposed Project's location on both private and federal land, it must comply with both Section 106 of the National Historic Preservation Act (NHPA), with the BLM as lead federal agency, and the California Environmental Quality Act (CEQA), with the Riverside County Planning Department as the lead state agency.

The Project area, as currently planned, is in Township 6S, Range 22E, Sections 27, 28, 29, 31, 32, 33, and 34; Township 7S, Range 22E, Sections 3, 4, 5, 6, 8, and 9; and Township 7S, Range 21E, Sections 1, 7, 8, 9, 10, 11, 12 and 14.

Prior to the field investigations, a records search was conducted at the Eastern Information Center at the University of California-Riverside on April 4, 2011. The records search indicated 25 cultural resource studies had been performed previously within one mile of the Project boundaries and 82 cultural resources have been documented within the same radius. Three of the previously recorded cultural resources are within the Project area. Two are transmission lines (P-33-12532 and P-33-14083) and one is a World War II-era refuse deposit (P-33-9186). These resources had been previously evaluated and recommended to be not eligible for inclusion in the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR) (Eckhardt and Jordan 2008; Pignolio 2003; Pignolio, Baksh, and Dietler 1999).

POWER performed a BLM Class III survey of 100 percent of the lands in the area of potential effects (APE) as defined at that time, including the proposed solar facility and transmission line ROW; only 20 acres within the Project boundaries had been previously surveyed. A total of 31 cultural resources were identified in the APE, including a portion of the World War II Blythe Army Air Base (archaeological resources and one standing building), six other archaeological sites, two transmission lines, and 22 isolated finds. In addition, two archaeological sites and two isolated finds were identified in an area that was later excluded from the APE.

Only one of the resources, the Blythe Army Air Base Historic District (P-33-018837), meets the criteria for either the NRHP or the CRHR and is recommended eligible.

Resource P-33-018837 was recorded in 2010 immediately adjacent to the western boundary of the Project, and was recommended eligible for listing in the NRHP (Mitchell 2010 a, b). Although the boundaries of the district as recorded in 2010 did not extend into the Project area, features associated with BAAB were found by POWER within the Project boundaries. These features were added to the existing district record. POWER recommends that the boundary of the Blythe Army Air Base Historic District be extended to include the components within Project boundaries because they contain contributing elements. This resource also qualifies as a historical resource under CEQA.

1.0 INTRODUCTION

1.1 Purpose of the report

This cultural resource survey report has been prepared by POWER Engineers, Inc. (POWER) to summarize the results of a records search, literature review, archaeological resource and built environment surveys, and communications with Native American representatives regarding cultural resources that could potentially be adversely affected by construction, operation, and maintenance of the proposed Blythe Mesa Solar Project (Project). This Project, which has been proposed by Solar Star Blythe Mesa 1, LLC (SSBM) and Renewable Resources Group (RRG), would be in Riverside County, California. The analysis is based primarily on an intensive archaeological and built environment survey of the area of potential effects (APE) for the Project. The study was also performed to support a joint environmental impact report/environmental assessment (EIR/EA) prepared to comply with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

1.2 Project Overview

The proposed Project consists of construction and operation of a 485 megawatt (MW) solar photovoltaic (PV) electrical generating facility and associated infrastructure on approximately 3,660 acres, primarily on private land (Table 1). For this report, the APE is defined to include the solar facility and the 125-foot wide right-of-way (ROW) of the proposed transmission line. Subsequent to completion of the survey, the APE was modified by the BLM to include a wider 300-foot ROW for the proposed transmission line and 300-foot corridors for two alternative routes. The results of archaeological survey of the additional APE are addressed in a separate report (POWER 2012). The proposed Project would produce enough energy to power approximately 180,000 households, and would consist of the following components:

- Solar array field utilizing single axis solar PV trackers.
- System of interior collection power lines located between inverters and substations.
- Three on-site substations (approximately 300 feet long by 300 feet wide).
- Two operation and maintenance (O&M) buildings (approximately 3,500 square feet each).
- Two primary off-site access roads and several interior access roads.
- Approximately 8.4 miles of 230 kilovolt (kV) transmission line, depending on the selected route alternative (archaeological survey of two alternative routes is discussed in a separate report [POWER 2012]).

Table 1. Project Acreage and Jurisdiction

	Private Land	BLM-Managed Lands	TOTAL
Solar Facility Site	3,587 acres	n/a	3587 acres
230 kV Transmission Line*	1.0 mile (15 acres)	3.8 miles (58 acres)	4.8 miles (73 acres)
TOTAL ACREAGE	3602 acres	58 acres	3660 acres

*Proposed transmission line only

The Project is in the Palo Verde Mesa region of Riverside County (Figure 1). The fenced-in solar facility would occupy 3,587 acres of private land. Within this area, a 230 kV transmission line would connect all three proposed substations, extending a distance of approximately 3.6 miles on site. From the southernmost substation to the Colorado River Substation, the transmission line would extend another 4.8 miles within a 125-foot wide right-of-way (ROW) (or 73 acres) traversing 3.8 miles of United States Department of the Interior, Bureau of Land Management (BLM)-managed lands (58 acres) and 1.0 mile of private land (15 acres). The proposed route was surveyed as part of the study, but two alternative routes had not been defined at the time of the survey, and therefore, were not included in this field survey. These two routes plus a wider 300-foot survey corridor for the proposed route are addressed in a separate survey report (POWER 2012).

The Project area to be occupied by the solar array field is primarily characterized by vacant and agricultural land uses. Existing vacant land consists of either fallow farmland or creosote bush scrub. The Project site includes both active and previously farmed lands. Active agricultural uses include a citrus grove and wheat and alfalfa fields. Jojoba was previously grown for commercial purposes. The area for the proposed transmission line, west of the solar array field, is primarily actively cultivated agricultural land, abandoned agricultural land, or disturbed creosote scrub.

Development in the surrounding area includes the community of Nicholls Warm Springs/Mesa Verde, Blythe Airport, the 520-MW natural gas-fired Blythe Generating Plant, electrical substations, electrical transmission lines, other solar projects, ancillary agricultural facilities, and dirt roads.

The location is depicted on the Roosevelt Mine, Ripley, and McCoy Wash 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles. The Project is in:

- Sections 1, 7, 8, 9, 10, 11, 12, and 14 of Township 7 South, Range 21 East
- Sections 3, 4, 5, 6, 8, and 9 of Township 7S, South, Range 22 East
- Sections 27, 28, 29, 32, 33, and 34 of Township 6 South, Range 22 East, of the San Bernardino Base Meridian

Interstate Highway 10 bisects the Project area, which is bounded on the north and south by undeveloped open desert, on the east by agricultural lands and on the west by the Blythe Airport and open desert lands. The Assessor Parcel Numbers (APN) for the solar facility, included for Riverside County Planning Department purposes, are listed in Table 2, and Table 3 lists the APNs for the proposed transmission line 125-foot ROW.

The Project would utilize single-axis PV trackers with 1,425,600 silicon solar panels. All panels would be oriented in the same direction as they track the sun's movement. By design, the PV panels absorb sunlight to maximize electrical output and use anti-reflective glass, resulting in about half the reflectance of standard residential and commercial glass.

The panels would be configured into trackers, and the trackers configured into blocks. Each block is comprised of six trackers with 18 north-south oriented rows of PV panels (295 feet long and 140 feet wide) that rotate up to 45 degrees from east to west to follow the daily motion of the sun (total number of rows is 35,640), with the center of rotation being 4 to 8 feet above grade. Torque tubes act as the horizontal support for the PV panels. The panels would be supported by micro-piles that would be driven directly into the ground to a depth of 8 to 12 feet using a vibration technology to reduce noise impacts. Torque tubes, electrical wire trays, and panels would then be installed on the piles. Concrete foundations for the drive motors (device used to move drive strut back and forth) would be poured in place, and electrical equipment for the array would be set in place. A tracked backhoe would drive piles. No blasting or rock breaking is anticipated or proposed. Small truck-mounted cranes or grade-all forklifts would place trackers on support piles.

Individual PV panels would be connected together in series to create a 'string' to carry direct current (DC) electricity. Multiple DC strings would be brought together into an above-ground combiner box to merge the strings into a single high-current cable. From the combiner boxes, the cabling would run in raceways and underground to inverters (5 feet wide and 10.5 feet tall) mounted on small concrete pads (minimum 0.5 feet above grade) distributed across the site. The inverters would take the DC output from the combiner boxes and convert it to alternating current (AC) electricity. Within the solar facility, 12-foot-wide dirt access roads would be constructed every 200 to 400 feet to allow access and maintenance of the solar panels.

Next, the AC electricity would be increased to medium voltage with a standard 'step-up' transformer. The medium voltage collection lines would begin at the inverter/transformer pads and would be placed in 3-foot deep trenches until the output from 10 to 15 blocks is gathered and transferred at risers to a system of overhead medium voltage collection lines for transmission to the substation. The medium voltage collection circuits would be mounted above ground on poles (35 to 60 feet tall), and carry 20 to 30 MW of electricity. To the extent possible, the poles would be located along the northern edge of the blocks.

The three Project substations (each 300 feet long by 300 feet wide) would collect all the medium voltage circuits (34.5 kV) and would step-up the voltage to 230 kV.

The Project substations and the interconnection point would be linked by a 230 kV double-circuit transmission line. The transmission line facilities include a single set of tubular steel poles 85 to 125 feet tall with an average distance between poles of 500 to 800 feet. The poles would be directly embedded in

the soil or set in concrete foundations 20 to 30 feet deep. Access roads to each structure will be 16 to 20 feet wide by 8 inches deep of gravel over compacted subgrade and located in the proposed ROW.

Two O&M buildings (approximately 3,500 square feet each, enclosed, and no more than 30 feet tall) would provide work and storage space. A covered outdoor temporary assembly and storage area (80,000 square feet, 25 feet tall) would be directly adjacent to the O&M buildings.

The site would be enclosed with fencing typically set 30 feet from the array. The purpose of the fencing is to restrict public access to the site.

2.0 REGULATORY FRAMEWORK

The principal laws relevant to the protection of cultural resources in the proposed Project area are the California Environmental Quality Act (CEQA), with particular reference to California Public Resources Code (PRC) 21083.2 to 21084.1, and the National Historic Preservation Act of 1966, as amended (NHPA). This document also supports an environmental analysis prepared to comply with the National Environmental Policy Act of 1969 (NEPA).

2.1 Federal

2.1.1 National Environmental Policy Act

NEPA (42 U.S.C. 4321-4346) establishes national policy for the protection and enhancement of the environment. Part of the function of the federal government in protecting the environment is to "preserve important historic, cultural, and natural aspects of our national heritage." The act is implemented by the Council on Environmental Quality (CEQ) regulations at 40 CFR 1500-1508.

For this Project, the BLM is the lead federal agency for NEPA compliance.

Although the only component of the Project on Federal land would be the proposed transmission line, the BLM considers the entire Project to be a connected action as defined by NEPA (40 CFR 1508.25 (a)(1)). Actions are connected if they automatically trigger other actions that may require an EIS; cannot or will not proceed unless other actions are taken previously or simultaneously; or if the actions are interdependent parts of a larger action and depend upon the larger action for their justification (40 CFR 1508.25 (a)(i, ii, iii)).

2.1.2 National Historic Preservation Act

The NHPA (16 U.S.C. 470f) is the principal federal law in the United States protecting cultural resources. Section 106 of the NHPA directs all federal agencies to take into account the effects of their undertakings (i.e., actions, financial support, and authorizations) on properties included in or eligible for the National Register of Historic Places (NRHP).

The Advisory Council on Historic Preservation (ACHP) regulations at 36 Code of Federal Regulations (CFR) Part 800 implement Section 106 of the NHPA. These regulations establish the NRHP as a planning tool to help federal agencies evaluate cultural resources in consultation with the State Historic Preservation Officer (SHPO) and the ACHP. The criteria for determining whether cultural resources are eligible for listing in the NRHP are provided in 36 CFR 60.4. These criteria are:

A. associated with events that have made a significant contribution to the broad patterns of history;
B. associated with the lives of persons significant in the past;
C. embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; possess high artistic value, or represent a significant and distinguishable entity whose components may lack individual distinction; or
D. have yielded, or may be likely to yield, information important in prehistory or history.

A cultural resource eligible for the NRHP is called a historic property regardless of the time period to which it dates. To be listed in, or determined eligible for listing in, the NRHP a cultural resource must meet one or more of the above criteria and possess integrity. Integrity is defined as the authenticity of a resource's historic identity as evidenced by the survival of physical characteristics that existed during the prehistoric or historic period of use. The NRHP recognizes seven aspects, which in various combinations define integrity: location, design, setting, materials, workmanship, feeling, and association. Integrity of location means the resource has not been moved from its historic location. Integrity of design, materials,

and workmanship mean the resource's original building materials, plan, shape, and design elements remain intact. Integrity of setting means the surrounding landscape has changed very little since the period of importance for the resource. Integrity of feeling and association means the resource retains a link to an earlier time and place and is able to evoke that era.

Historic properties must generally be at least 50 years old; however, certain cultural resources associated with more recent, exceptionally important events (e.g., the development of nuclear energy; space exploration) may also be considered eligible to the NRHP.

Compliance with Section 106 is required whenever a project has a federal nexus, meaning the project is on federal land, uses federal funds, or is permitted by a federal agency. The BLM proposes to issue a new ROW grant for the proposed transmission line. This activity constitutes an undertaking as defined in 36 CFR 800.16 (y).

As discussed in Section 2.1.1, the BLM considers the development of the proposed solar facility to be a connected action, even though the solar facility would not itself be on federal land. The BLM's 8100 manual series on cultural resources explains BLM's Section 106 responsibility on non-federal lands. Factors taken into consideration include the degree of federal involvement; the nature and extent of potential effects on historic properties; the likely nature and the location of historic properties in the APE; and the views of the SHPO, Tribes, and interested public. However, the primary factor is the extent to which BLM's authorization (in this case of the proposed transmission line) could result in effects to historic properties, including properties within the proposed solar facility.

2.1.3 Antiquities Act

The Antiquities Act of 1906 (16 U.S.C. 431-433) was the first law to protect and preserve cultural resources on federal lands. It makes it illegal to remove cultural resources from federal lands without a permit and establishes penalties for illegal excavation and looting. The Archaeological Resources Protection Act of 1979 (ARPA) (16 U.S.C. 470) reinforces and replaces portions of the Antiquities Act as the authority for special use permits regarding archaeological investigations.

2.1.4 Federal Land Policy and Management Act

The Federal Land Policy and Management Act of 1976 (FLPMA) (43 U.S.C. 1701) requires the BLM to manage their lands on the basis of multiple use in a manner that will "protect the quality of…historical …resources and archaeological values." FLPMA is a comprehensive law that provides for the periodic inventory of public lands and resources, for long-range, comprehensive land use planning, for permits to regulate the use of public lands, and for the enforcement of public land laws and regulations. FLPMA compels agencies to manage all cultural resources on public lands through the land management planning process.

2.1.5 Archaeological Resources Protection Act

The ARPA (16 U.S.C. 470 aa-mm)establishes civil and criminal penalties for the unauthorized excavation, removal, damage, alteration, or defacement of archaeological resources; prohibits trafficking in resources from public lands; and directs federal agencies to establish educational programs on the importance of archaeology. The act also establishes permit requirements for removal or excavation of archaeological resources from federal lands. The law applies to archaeological resources more than 100 years old found on public lands. No distinction is made regarding NRHP eligibility.

2.1.6 American Indian Religious Freedom Act

The American Indian Religious Freedom Act of 1978 (AIRFA) requires federal agencies to consult Native American groups when a proposed land use might conflict with traditional Indian religious beliefs

or practices; to avoid interference with these beliefs to the extent possible; and to maintain access to religious or sacred areas whenever feasible.

2.1.7 Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 U.S.C. 3001) provides a process for federal agencies to return certain Native American cultural items – human remains, funerary objects, sacred objects, or objects of cultural patrimony – to lineal descendants and culturally affiliated Indian tribes. NAGPRA includes provisions for unclaimed and culturally unidentifiable Native American cultural items, intentional excavation and unanticipated discovery of Native American cultural items on federal lands, and penalties for noncompliance and illegal trafficking. Permits for the excavation or removal of cultural items protected by the act require Tribal consultation, as do discoveries of cultural items made during activities on federal lands. The Secretary of the Interior's implementing regulations are at 43 CFR Part 10.

2.1.8 Executive Order 11593, Protection and Enhancement of the Cultural Environment

Issued in 1971, Executive Order (E.O.) 11593 directs land-holding federal agencies to identify and nominate historic properties to the NRHP and requires that these agencies avoid damaging historic properties that might be eligible to the NRHP. It also directs agencies to treat resources eligible to the NRHP as if they were already listed.

2.1.9 Executive Order 13007, Indian Sacred Sites

E.O. 13007, issued in 1996, directs federal agencies responsible for managing federal lands to accommodate access to, and ceremonial use of, Indian sacred sites by Indian religious practitioners; avoid adversely affecting the physical integrity of such sacred sites; and maintain the confidentiality of sacred sites.

2.1.10 Executive Order 13175, Consultation and Coordination with Indian Tribal Governments

E.O. 13175 issued in 2000, directs federal agencies to establish regular and meaningful consultation and collaboration with Tribal officials in the development of federal policies that have Tribal implications, to strengthen the United States government-to-government relationships with Indian tribes, and to reduce the imposition of unfunded mandates upon Indian tribes.

2.1.11 Executive Order 13287, Preserve America

This executive order, issued in 2003, encourages the federal government to take a leadership role in the protection, enhancement, and contemporary use of historic properties and establishes new accountability for agencies with regard to inventories and stewardship.

2.1.12 Memorandum for the Heads of Executive Departments and Agencies Regarding Government-to-Government Relations with Native American Tribal Governments

The Presidential memorandum, issued in 2009, directs each federal agency to operate within a government-to-government relationship with federally recognized tribal governments; consult with tribal governments; assess the impact of plans, projects, programs, and activities on tribal trust resources; and assure tribal rights are taken into account during consideration of such plans, projects and activities.

2.2 State

2.2.1 California Environmental Quality Act (CEQA)

Under CEQA, a project is considered to have a significant effect on the environment if it causes a substantial adverse change in the significance of a historical resource or unique archaeological resource. Substantial adverse change means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource would be materially impaired or diminished. Furthermore, it is recommended by CEQA that cultural resources be preserved *in situ* whenever possible through avoidance of the resource. Whenever a historical resource or unique archaeological resource (Public Resources Code [PRC] 21083.2) cannot be avoided by project activities, effects shall be addressed and mitigated as outlined in PRC 15126.4 and 15331 of CEQA.

For this Project, Riverside County is the lead state agency for CEQA compliance.

Historical Resources

According to CEQA, lead agencies are required to identify historical resources that may be affected by any undertaking involving state or county lands, funds, or permitting. Also, the significance of such resources that may be affected by the undertaking must be evaluated using the criteria for listing in the California Register of Historical Resources (CRHR) (PRC 5024.1, Title 14 CCR, Section 4852). Generally, a resource is considered by the lead agency to be historically significant if the resource has integrity and meets the criteria for listing in the CRHR. Resources already listed in or determined eligible for the NRHP and California Historic Landmarks (CHL) No. 770 and above are by definition eligible for the CRHR. Historical resources included in resource inventories prepared according to California State Office of Historic Preservation (OHP) guidelines or designated under county or city historic landmark ordinances may be eligible.

For a resource to be eligible for the CRHR, it must satisfy each of the following three standards:

I. A property must be significant at the local, state or national level, under one or more of the following criteria:

    1) It is associated with events or patterns of events that have made a significant contribution to the broad patterns of the history and cultural heritage of California and the United States.
    2) It is associated with the lives of persons important to the nation or California's past.
    3) It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
    4) It has yielded, or may be likely to yield, information important to the prehistory or history of the state or the nation.

II. A resource must retain enough of its historic character or appearance to be recognizable as a historic property, and to convey the reasons for its significance.
III. It must be fifty years old or older (except for rare cases)

Integrity is defined as the authenticity of a historical resource's physical identity, evidenced by the survival of characteristics that existed during the resource's period of significance. CRHR regulations specify that integrity is a quality that applies to historical resources in seven ways: location, design, setting, materials, workmanship, feeling, and association.

Unique Archaeological Resources

Under CEQA, the lead agency must also determine whether a proposed project will have a significant effect on unique archaeological resources. PRC 21082.2(g) states:

"…a 'unique archaeological resource' means an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person."

A non-unique archaeological resource does not meet these criteria and does not need to be given further consideration other than simple recording, unless it happens to qualify as a historical resource.

Native American Human Remains

CEQA (PRC 15064.5) provides that when an initial study identifies the existence of, or probable likelihood, of Native American human remains within the project, a lead agency will work with the appropriate Native Americans as identified by the Native American Heritage Commission (NAHC).

2.3 Local

2.3.1 Riverside County General Plan

Chapter 5 of the Riverside County General Plan outlines policies intended to promote the preservation of cultural resources in the County of Riverside. Open Space Policies 19.2-19.4 within this chapter identify the need for a review of project's archaeological sensitivity, resource confidentiality, Native American consultation, and a report of findings. Open Space Policies 19.5-19.7 identify the need for review of large development project proposals by the History Division of the Riverside County Regional Park and Open-Space District with respect to the potential destruction or preservation of historical sites. The chapter also calls for promotion of built environment preservation through application of the Historic Building Code and authorization of tax credits for historic building and structure retrofitting.

County requirements for the management of cultural resources impacted by the Project are listed in Appendix E.

3.0 ENVIRONMENTAL SETTING

The Project area is in the Palo Verde Valley, which is along the western edge of the Colorado River. This area is on Palo Verde Mesa, a series of ancient raised river terraces, and is part of the Sonoran Desert. The topography is relatively flat and slopes toward the southeast; elevations range from 260 to 400 feet above mean sea level (AMSL). The Project area is near the Big Maria Mountains on the northwest, the McCoy Mountains on the west, the Mule Mountains on the southwest, and the Colorado River on the east. These mountain ranges, trending northwest to southeast, create a natural barrier between the Colorado River and the greater Colorado Desert. Development in the Project vicinity includes agricultural fields and groves as well as the Blythe Airport. The Project area also includes undeveloped open desert.

The subtropical climate of the Colorado Desert, a sub-region of the Sonoran Desert, is currently characterized by dry, mild winters averaging 45 degrees Fahrenheit (˚F) and dry, hot summers that average 104˚F. Summer highs are known to reach 120˚F. Precipitation ranges between two and ten inches per year, with most of the precipitation occurring between November and March. Although rainfall is primarily in the winter months, the region is periodically influenced by tropical weather conditions including sudden monsoonal summer storms.

In the Riverside County region, conditions during the Late Pleistocene (22,000 to 11,000 years before present [BP]) were cooler and wetter than today, and supported pinyon-juniper woodlands, lakes, savannah grasslands and creosote scrub at the lower elevations. The course of the Colorado River changed over time, creating terraces and depositing sediments between its headwaters in the Colorado Rocky Mountains and its terminus in the Gulf of California. During the Early Holocene (11,000 to 8,000 BP) the river flowed into previously dry areas inland and with periodic flooding episodes, the extent of inland lakes, such as the Salton Trough and the ancient Lake Cahuilla, increased dramatically. During the Middle to Late Holocene (8,000 BP to present) the warm and dry conditions continued and were dominated by summer monsoons in the desert and winter storms along the coast. Lakes became ephemeral (Van Devender and Spaulding 1983).

Research of the Mojave Desert paleohydrology is provided by packrat midden studies. The reduction in the presence of blackbrush (*Coleogyne ramosissima*) desert scrub in middens clearly indicated a warmer and drier environment. However, to the south in the Salton Sink the timing of the filling and emptying of ancient Lake Cahuilla contradicts the chronology of droughts experienced in the Mojave Desert. Geomorphic evidence demonstrates that the high lake stands were the result of the shifting of the Lower Colorado River channel. Lake Cahuilla was frequently filled between 500 and 1,500 BP, although not necessarily due to climatic factors (Waters 1983).

Surface water sources are minimal on Palo Verde Mesa, limited to seasonal and perennial sources. Perennial water comes from McCoy Springs in the McCoy Mountains west of the Project area. Springs, including McCoy Springs, are at the bases of the nearby mountains. Monsoon activity turns dry washes into raging torrents that cut through Palo Verde Mesa. The Colorado River is eight miles to the east of the Project area.

Sediments in the Project area originated from quaternary deposits from the Colorado, which ran through the Project area, and from alluvial fan deposits from the mountains to the northwest. Alluvium, colluvium, and slope-wash deposits of the Late Pleistocene and Holocene are found in drainage features, including valleys and streams. The alluvial deposits grade indiscernibly with colluvium and slope-wash deposits flanking the lower slopes next to the valleys. Large remnant river terraces remain in the Project area. Heavily patinated desert pavement (a layer of course pebbles and gravel created after wind removal of the finer materials) is common in this climate and is often present in broad, well-developed patches in the Project area (Norris and Webb 1990). Nearby terrace-top cobble deposits were a source of stone

material collected by Native Americans. This lithic material includes quartzite, chert and chalcedony, all of which were used by the prehistoric inhabitants for stone tools.

Today, the vegetation communities in the Project area are similar to those of the Mojave Desert to the northwest. These vegetation and habitat communities are sparse but are able to support Creosote Bush Scrub and also include Desert Dunes, Desert Dry Wash Woodland, and Agricultural Land. The natural vegetation community is primarily creosote bush scrub, which includes creosote bush (*Larrea tridentate)* and white bursage or burrobush (*Ambrosia dumosa).* Closer to the Colorado River, palo verde (*Parkinsonia florida)* is found in drainages as well as mesquite (*Prosopis* spp.) and ironwood (*Olneya tesota)* bushes. These are among the important food plants used by the local tribes (Bean and Saubel 1972). Currently, the land within the Project boundaries is used for agriculture or is open, undeveloped desert.

Fauna in the Project area include desert cottontail (*Sylvilagus audubonii*), black-tailed jackrabbit (*Lepus californicus*), mule deer (*Odocoileus hemionus*) and Desert bighorn sheep (*Ovis canadensis nelsoni*). The desert cottontail is most abundant in the dunes area whereas the black-tailed jackrabbit is more prevalent on the desert floor, floodplains, and rocky slopes (Ryan 1968; Jaeger 1965). Reptiles include lizards and snakes, particularly the western diamondback (*Crotalus atrox*), and the desert tortoise (*Gopherus agassizi*). Avian species common to the Project area include the common raven (*Corvus corax*) and the greater roadrunner (*Geococcyx californianus*).

4.0 CULTURAL SETTING

4.1 Prehistoric Context

Archaeological research in the Colorado Desert began in the 1930s with Malcolm Rogers. He established artifact typologies and a chronology based on tools and settlement patterns. His research is used as the foundation of current research in the area. The majority of archaeologists working in the region use the following cultural sequence, which is a brief synthesis of the prehistory of the region as we understand it, Paleoindian Period (about 12,000-7,000 BP), Archaic Period (7,000 – 1,500 BP) Late Prehistoric Period (1,500 to 150 BP).

4.1.1 Paleoindian Period (San Dieguito) (12,000-7,000 BP)

The Paleoindian period experienced profound environmental changes, as the cool, moist conditions of the Pleistocene gave way to the warmer, drier climate of the Holocene (Spaulding 1990). Settlement patterns of this period suggest habitation occurred along prehistoric lakeshores and on mesas near springs and washes (Schaefer and Laylander 2007). The Palo Verde Mesa area was not conducive to settlement due to the limited water resources available and was likely used as a travel corridor between the mountains and rivers (von Werlhof 2004). In the larger Riverside County region, Paleoindian sites may be found on stable landforms and in protected caves above floodplains and valley/riparian environments and along ridge systems and in mountain passes that may have served as travel routes (Moratto 1998).

The Paleoindian inhabitants were nomadic large-game hunters whose tool assemblage included choppers; percussion-flaked scrapers and knives; large, well-made fluted, leaf-shaped, or stemmed projectile points (e.g., Lake Mojave, Silver Lake); crescents; heavy core/cobble tools; hammerstones; bifacial cores; and scraper planes (Rogers 1939, 1966; Warren 1968). The subsistence strategy used during the San Dieguito period focused primarily on hunting large and small game as well as gathering available plants available throughout the seasons. Near the end of this period, the climate began to warm, which caused the lakes and marshes to dry, resulting in the need for different subsistence and settlement strategies (Moratto 1984).

4.1.2 Archaic Period (Pinto and Amargosa) (7,000–1,500 BP)

The climatic patterns of the Late Paleoindian period continued into the Early Archaic period. In the Colorado Desert region, Rogers (1939) assigned the Amargosa complex to this period, which dates to approximately 8,000 – 1,500 BP (Vaughn and Warren 1980). Tool types identified with this period include Pinto and Amargosa projectile points and knives, scrapers and choppers. The use of ground stone tools increased during this period (McGuire and Schiffer 1982; Warren 1984).

In the inland regions of Southern California, this period of cultural development is marked by tools used for grinding seed for flour. Artifacts dating to this period include large leaf-shaped projectile points and knives; manos and milling stones used for hard-seed grinding; and many other artifacts, such as beads, pendants, charmstones, discoidals, spherical stones, and cogged stones (Kowta 1969; Warren, et al. 1961).

The beginning of the Late Archaic coincides with a period of increased moisture in the region. Research suggests the California desert environment was unstable during these time periods, forcing the hunter-gatherers towards more hospitable regions (Crabtree 1981; Schaefer 1994; Weide 1974). However, Late Archaic sites have been recorded in more southern portions of Riverside County's low desert near the Peninsular Ranges where water was more available.

Late Archaic site types include residential bases with large, diverse artifact assemblages, abundant faunal remains, and cultural features, as well as temporary bases, temporary camps, and task-specific activity areas. Diagnostic projectile points of this period include more refined notched (Elko), concave base

(Humboldt), and small stemmed (Gypsum) forms (Warren 1984). The mortar and pestle were used to process acorns, an important storable resource. *Haliotis* and *Olivella* shell beads, and ornaments and split-twig animal figurines indicate the interior California occupants were in contact with populations on the California coast and in the southern Great Basin.

4.1.3 Late Prehistoric (Patayan Complex) (1,500–150 BP)

A period of even more persistent drought began by 1,500 years ago, and conditions became significantly warmer and drier (Jones et al. 1999; Kennett and Kennett 2000). The dry period continued until 750 years ago (Spaulding 2001).

The Patayan complex is marked by strong regional cultural developments to the economic system and settlement patterns, especially in the Southern California desert regions, which were heavily influenced by the Hakataya (Patayan) culture of the lower Colorado River area (Warren 1984). This period includes a pre-ceramic transitional phase ranging between 1,500 and 1,200 years BP. The Patayan complex is distinguished from the transitional phase by the introduction of pottery using the paddle-and-anvil technique as well as the use of bow-and-arrow technology. Also noted is the use of floodplain agriculture (Rogers 1945). The annual flooding of the Colorado River provided water to sustain the crops and also revitalize the soil. Nearby Lake Cahuilla appears to have flooded between 950 and 300 years BP (Laylander 1997; Schaefer 1994). These technological advancements are believed to be from Mexico or the ancestral Pueblo cultures of the Southwest deserts (McGuire and Schiffer 1982; Rogers 1945; Schroeder 1979).

Diagnostic artifacts include Saratoga Springs projectile points, small triangular projectile points, mortars and pestles, steatite ornaments and containers, perforated stones, circular shell fishhooks, numerous and varied bone tools, and bone and shell ornaments. Elaborate mortuary customs and extensive trade networks are also characteristic of this period. Additionally, abundant amounts of obsidian were being imported into the region from the Obsidian Butte source exposed by the desiccation of Lake Cahuilla.

Two ceramic types have been identified as the most prevalent for the Palo Verde Valley area, Lower Colorado Buffware and Tizon Brownware. Harner (1957) observed in the Chuckwalla Valley the frequency of Lower Colorado Buff was double that of the Tizon Brown. When this pottery was compared and cross-dated with a collection from the Bouse Site in Arizona, Harner found the pottery from the Chuckwalla Valley could date between A.D. 1300 and 1900.

Lower Colorado Buffware is made from riverine and lacustrine clay, usually with fine grains of sub-angular to sub-round quartz, feldspars, and other opaque spars. Most vessels are highly oxidized due to the firing process. The surface finish is typically smoothed with faint wipe marks left by mops. The larger vessels may display anvil marks on the interior surfaces. A thick cream-colored scum coat is common in the desert regions, and stucco treatment is also common along the Colorado River and in the desert. The surface color is usually tan with pink tones. Recurved rims are common, polish is rare, and decorations often include fingernail impressions, in casing and punched holes. Colorado Buff dates to Patayan III (A.D. 1500 to post-1900).

Tizon Brownware is made from clays from decomposing granite outcrops in the California-Colorado desert regions, and usually contains higher iron content. The vessels are typically reddish brown and contain little to no temper. Both Tizon Brown and Lower Colorado Buff were usually made using coils, smoothed and shaped by a paddle and anvil.

In an ongoing study, Laylander and Schaefer (2010) have applied a regional perspective to evaluate and treat cultural resources within a broad landscape approach (2010). The current Project falls within their

Prehistoric Trails Network Cultural Landscape (PTNCL) area, which includes Palo Verde Valley, McCoy Wash and Palen Valley.

By the Late Prehistoric period there appears to have been a transition to more mobile patterns of travel and trade between the Colorado River and Lake Cahuilla (Pendleton 1984). Long range travel for resource procurement and trade resulted in a system of trails through the Colorado Desert. The increased mobility along the trail system also allowed the opportunity for interaction between neighboring tribes. As the Spanish began to explore the area, native trails and trade routes were used and expanded.

Three prehistoric trails, described below, were in the Project vicinity; these were likely used to travel to and from springs and other water sources. McCarthy (1993) explained trails in the McCoy Springs region were unbordered and did not indicate evidence of deliberate construction.

Early research in the area noted recognizable trail types, including major long-distance, minor long-distance, and subsidiary trails between settlements and resources areas (Rogers 1941). McCarthy (1993) defines two types of trails, primary and secondary. Primary trails are based around a destination fixed on the landscape, such as a spring. McCoy Springs was the destination spot for all of the trail segments in the current Project vicinity. Secondary trails branch off from the primary trails. McCarthy identified CA-RIV-53, east and northwest of the Project, as the predominant trail leading to McCoy Springs. The trails along the southern flank of the McCoy Mountains probably emanate from the Colorado River (Palo Verde Valley) and lead toward Chuckwalla Valley. Between the McCoy and the Chuckwalla Mountains, several springs (McCoy, Chuckwalla, and Corn Springs), tanks (Palen and Mule Tanks), and dry lake beds (Ford Dry Lake and Palen Lake) were linked with a network of trails. The trails found on the desert pavement were in excellent condition. These trails include CA-RIV-53 (known as the Halchidhoma Trail), CA-RIV-885, less than a mile southwest of the Project, and CA-RIV-3673 less than a mile northeast of the Project.

Other trails lead toward canyons containing temporary water sources. Petroglyph sites have been documented in these canyons; two short trail segments that lead to a large canyon southeast of McCoy Peak have been documented in the Project vicinity. In addition to water sources, other resource areas would include lithic quarries and assay areas. A line of pebble terraces line the southern flank of the McCoy Mountains. Several extremely large prehistoric lithic sources and assay sites have been recorded in these terraces. Trail segments between these sites have been documented. One segment, CA-RIV-3671, is within one mile of the Project (von Werlhof 1987). McCarthy speculates shorter trail segments in the area of McCoy Wash were used to connect specialized activity areas within larger habitation areas (McCarthy 1993).

Trails were also used for trade routes. Trade between southern California and the Southwest may have begun more than 9,000 years ago (Ruby 1970), but the predominant trading activity ranged between A.D. 900 and A.D. 1300. Exchange items included California marine shell and Southwestern pottery. Johnston and Johnston (1957) found segments of trails from the Colorado River through the San Gorgonio Pass and into Riverside County. The system connected the Palo Verde Valley to the McCoy Mountains through the Chuckwalla Valley into the Chuckwalla Mountains.

Trails are also a significant element in the sacred landscape; they link the spiritual world to the natural landscape. Trails have been marked with rock shrines and artifacts such as pottery drops and flaked stone scatters, particularly white quartz. Songs and stories contain named places such as mountains, water sources, valleys and other geographical locations along known trails (Fowler 2009).

4.2 Ethnography

The Colorado Desert area of Riverside County is within the ethnographic boundaries of several different 18th and 19th century Native American groups. Ethnographers documented these tribes and prepared syntheses for the Quechan (Bee 1981, 1982, 1983, 1989; Forbes 1965; Forde 1931), Halchidhoma (Harwell and Kelly 1983; Spier 1933), the Mojave (Kroeber 1925; Stewart 1983), and the Chemehuevi (Kelly and Fowler 1986; Laird 1976, 1984), as well as the Cahuilla (Bean 1972; Bean and King 1974; Bean and Vane 1978) (see Figure 2).

4.2.1 Colorado River Peoples: the Quechan, Halchidhoma, and Mojave

The first Europeans to encounter and document the traditional inhabitants of the Lower Colorado River tribes were the Spanish, followed by American explorers. Kroeber (1920, 1925) conducted extensive fieldwork at the turn of the 20th century; in particular, he studied the Mojave tribe in the Needles area. Spanish missionary influence did not reach the desert cultures, which enabled them to retain much of their language, religion, and cultural practices. Early ethnographers were able to conduct fieldwork and documented many details about oral histories, ritual and burial practices, as well as life-ways practiced prior to contact and those during the first half of the 20th century. Malcolm Rogers studied the Colorado River Tribes in the 1930s and documented lithic and ceramic technologies.

After A.D. 1000, the Colorado River tribes appear to have become more mobile and extended their travel between the river and Lake Cahuilla; and consequently expanded their resource procurement patterns (Pendleton 1984). This resulted in the development of an extensive trail network throughout the Colorado Desert. Evidence of travel and trade is indicated by the presence of pottery drops and shrines lining the trails (McCarthy 1993). The trails network was also a major component of the tribe's belief system, interconnecting important geographical locations and ceremonial sites with song cycles and rituals.

Lithic quarries along various mountain ranges were used for tool material, springs within these mountains provided water. Several springs are located within a day's travel of the Project area, in addition to McCoy Springs, Corn and Chuckwalla Springs are less than 30 miles to the west.

The lower Colorado River region was inhabited by numerous tribes at the time of the first Spanish contact. Alarcon and Diaz were the first to travel up the Colorado River in 1540; their description of the interaction between tribes indicates shifting boundaries and inter-tribal hostilities (Forbes 1965). A later expedition by Onate in 1605 documents several tribes, including the Halchidhoma, the Quechan and the Mojave at various points along the river. By 1774, the Anza Expedition encountered the Halchidhoma living between the Mojave and Quechan territories near Parker, Arizona. Historical accounts describe constant conflict among the tribes with the Quechan and Mojave against the Halchidhoma. Ultimately, the Halchidhoma left the area and resettled in the mid-1800s in the Gila River area (Dobyns et al. 1963; Kroeber 1925).

Settlement was determined primarily by proximity to permanent water sources. Villages and camp sites were most often in the foothills and less frequently on the desert floor, depending on the availability of water. Tribal boundaries and territories were dynamic as a result of interactions and warfare between tribes (Forbes 1965).

Like some of the other river Yuman tribes, the Mojave focused on floodplain agriculture, producing close to half of their dietary needs from crops, including maize, squash, melons, beans and a variety of grasses (Bee 1983; Castetter and Bell 1951). Similarly, the Quechan also relied on agriculture as well as fish from the Colorado River. In addition, both small and large game were hunted, adding important dietary protein.

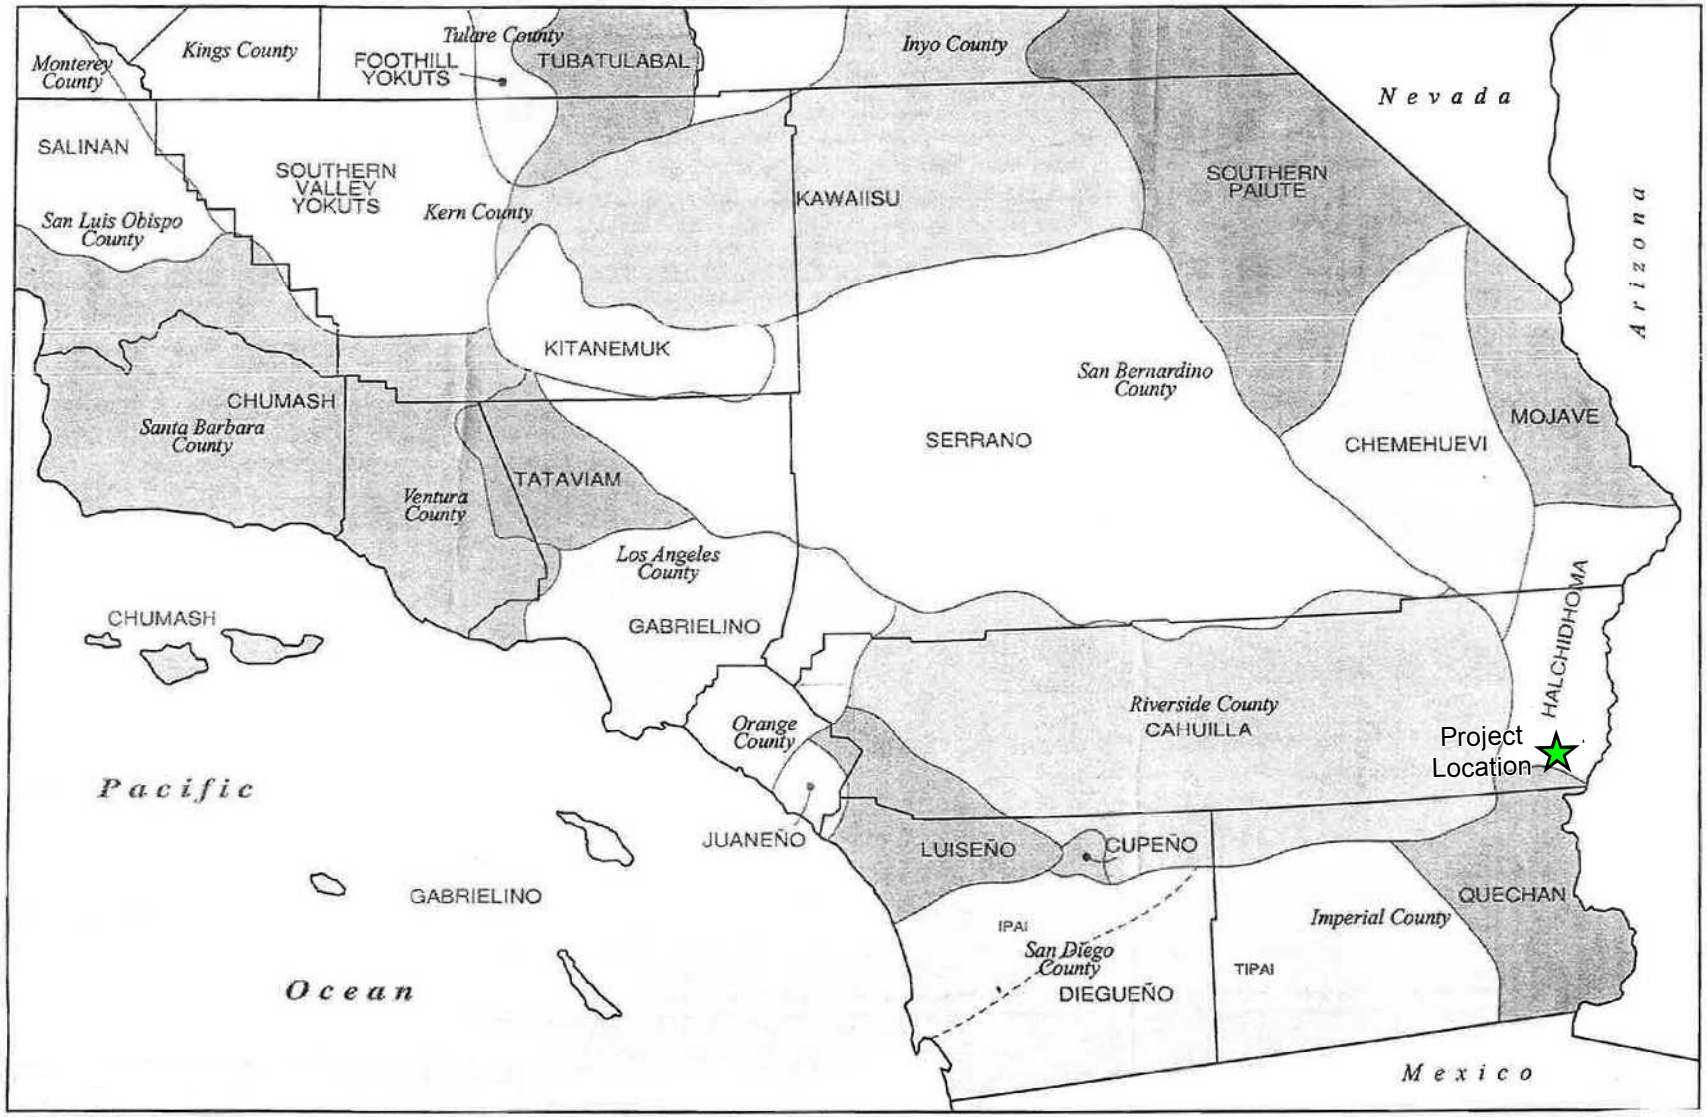

Figure 2 - Ethnographic Boundaries

The Colorado River Tribes share similar beliefs strongly linked to dreaming and ritual songs that apply to daily life and personal knowledge. These beliefs are based on real places that are visited physically or in dreams (Kroeber 1925). Forbes noted religion, cultural identity, various aspects of daily life, and the landscape on which they lived were intricately intertwined. Important ceremonial locations include intaglios, petroglyphs, lithic scatters and cleared circles along the Colorado River and in the surrounding hills. As previously mentioned, one key component of the cultural landscape is a regional trail system (Forbes 1965).

4.2.2 Chemehuevi

The Chemehuevi tribe is the southern-most group of the Southern Paiutes (Kelly and Fowler 1986). Their territory included the western side of the Colorado River into the Palo Verde Mountains and north toward Cadiz Dry Lake.

The Chemehuevi share many cultural elements with the Mojave, including habitation structures, ground stone tool types as well as spiritual beliefs. The Chemehuevi were organized in small mobile groups who traveled widely, interacting with neighboring tribes. They subsisted on small game, hunting as far west as San Bernardino, and on harvesting seasonal plant resources throughout the region. They hunted with the Quechan in Arizona and the Serrano in Tehachapi, and were reported to have hunted abalone shell in the Santa Barbara Channel and to have journeyed to the Hopi Villages (Kelly and Fowler 1986). They were not known to have used pottery but rather chose basketry and other woven implements, often decorated. The Chemehuevi who settled along the Colorado River lived in relatively permanent structures and utilized agriculture to a greater extent than related groups to the west (Laird 1976). Historically, they grew a variety of crops including vegetables, beans, winter wheat and grasses.

Chemehuevi spiritual beliefs include a sacred landscape that incorporates both the spirit world and the natural world. These rituals include songs and dreams that are the basis of their daily lives, linking their beliefs, material existence and the cultural landscape. Kroeber states that knowledge is acquired by each man according to his dreams (Kroeber 1925). The "Salt Song" describes a ceremonial trail across three states and the significance of the mountains and the medicines found in them.

4.2.3 Cahuilla

The Cahuilla are one of several groups who migrated into California from the Great Basin, although the specific time, duration, and process is unclear, it is estimated to have taken place around 1,500 BP (Kroeber 1925; Laylander 1985). The Cahuilla's traditional territory encompassed diverse topography ranging from 273 feet below sea level at the Salton Sink to 11,000 feet AMSL in the San Bernardino Mountains. Their territory extended from the summit of the San Bernardino Mountains in the north to the Chocolate Mountains and Borrego Springs in the south. Its eastern border included the Colorado Desert west of Orocopia Mountain, and its western border included the San Jacinto Plain near Riverside and the eastern slopes of Palomar Mountain (Bean 1978).

Although the traditional territory is vast, the Santa Rosa and San Jacinto Mountains and the Coachella Valley in Riverside County are the center of the Cahuilla, including Palo Verde Mesa. Numerous land holding clans claim territory in this area, each of which ranged from the desert to the mountain areas. Clans could include more than one lineage that had independent community areas owned within the larger clan area (Wilke and Lawton 1975).

Cahuilla villages usually were in canyons or along alluvial fans near adequate sources of water and food plants. The immediate village territory was owned in common by a lineage group or band. The other lands were divided into tracts owned by clans, families, or individuals. Trails used for hunting, trading, and social interaction connected the villages. Each village was near numerous sacred sites such as rock art panels (Bean and Shipek 1978).

The Cahuilla belief system and oral tradition indicate that when Lake Cahuilla dried up, the desert floor was settled; 17 or more rancherias have been identified in Coachella Valley. These rancheria locations are associated with hand-dug wells, springs, or palm oases. Water collection and conveyance features and associated agricultural fields have been documented from the early 1800s (Wilke and Lawton 1975).

4.3 Euro-American Context

European presence in the Colorado River region began with explorations in the 16th century; however permanent settlement occurred in the mid-19th century as a result of the development of transportation and water conveyance. Exploration was primarily for travel routes in search of interior waterways and from Mexico north toward Monterey for the establishment of the California missions by the Spanish. The end of the Mexican War of 1846-1848, the discovery of gold in California in 1849, and the establishment of California as a state on September 9, 1850 all contributed to a steady influx of non-Hispanic settlers into the area. Later, mining, agriculture and military training brought settlement to the Riverside County area.

4.3.1 Transportation

Prior to the European presence in the Colorado Desert area, transportation was limited to foot trails used by the Native Americans. As the Spanish began to explore the area, these native trails and trade routes were further used and expanded. One of the more important routes, known as the Bradshaw Trail, was developed as the result of the search for gold in Southern California, specifically in the area of La Paz, along the eastern side of the Colorado River (Gunther 1984; Johnston 1972, 1987), north of the Project area. William D. Bradshaw, a forty-niner working in the San Bernardino County area, was determined to find an overland route from the Pacific Ocean to the Colorado River, where gold had been recently discovered in what is now Ehrenberg. Bradshaw had previously mined for gold in Sutter's Mill in 1849, and anticipated La Paz to become a gold strike boom-town. To accommodate the expected influx of miners headed toward La Paz, Bradshaw recruited a group of eight men to scout out a direct route (Gunther 1984; Johnston 1972, 1987).

Bradshaw worked with Chief Cabazon, the leader of the Desert Cahuilla, and a Coco Maricopa Indian mail runner to map a route using an ancient native trail that linked water sources across the Colorado Desert. The trail passed through the San Gorgonio Pass through Palm Springs, then turned south and ran through Martinez to the north side of the Salton Sink and between the Orocopia and Chocolate Mountains ranges. The route then skirted the southern edge of the Chuckwalla range crossed through the Mule Mountains and reached the Palo Verde Valley. Bradshaw also established a ferry service to cross the Colorado River and proceeded to promote his new trail and ferry enterprise (Gunther 1984; Johnston 1972, 1987). The Bradshaw Trail is 5.5 miles south of the Project area.

Also paramount to the development of the Colorado Desert was the arrival of the Southern Pacific Railroad (SPRR), a transcontinental railroad system. The SPRR was founded as a land holding company in 1865 and acquired various smaller railroad companies that would eventually link New Orleans, Texas, New Mexico, Arizona and California through Los Angeles and then north into San Francisco through to Portland, Oregon. Numerous communities sprang up along the route and greatly accommodated the mining boom in the local area (Vredenburgh et al. 1981). The railroad was instrumental in settlement of the Colorado Desert areas by providing access to immigrants as well as shipping consumer goods and produce between the east and west coasts (Fickewirth 1992). The SPRR reached Yuma, Arizona in 1877 and links north on the river were provided by commercial river boat traffic (Vredenburgh et al. 1981). Later, to facilitate the mining activities in the Blythe area, a spur was constructed to the Atchison, Topeka, and Santa Fe Blythe-Ripley Line in 1916.

4.3.2 Mining

With the signing of the Treaty of Guadalupe-Hidalgo in 1848, the U.S. Southwest came under the control of the United States. The Colorado Desert was the scene of prolonged mining from 1850, with the beginning of the gold rush in California. The small town of La Paz, 45 miles northeast of Blythe on the eastern bank of the Colorado River, was a boomtown in the 1860s (Wilson 1961). The mid-1860s saw the town of La Paz swell in population to over 5,000, but by 1870 the miners had gleaned most of the gold-bearing ore from this site.

Mining and prospecting was primarily focused in the mountains and high desert north of Blythe but small-scale mining did occur from the 1860s until after the Great Depression in the 1930s (Morton 1977). Although gold was found only in small amounts, mining of gypsum and manganese were more successful ventures. To the north in the McCoy Mountains, several significant manganese mines provided ore for armaments during both World Wars I and II (Butler 1998). Other minerals mined from the areas surrounding the Project area include fluorite, copper and uranium (E. Warren et al. 1981).

4.3.3 Homesteading and Agriculture

The passage of the Homestead Act in 1862 and the Desert Land Act in 1877 were instrumental in the settlement of the Lower Colorado River area. The Homestead Act offered the opportunity for United States citizens to file a claim on 160 acres or less of land for $1.25 per acre. The Act stipulated that the claim be for purposes of actual settlement and cultivation, and the claimant was required to 'improve' the plot by building a dwelling and cultivating the land. After five years on the land, the original filer was entitled to the property, free and clear.

The Desert Land Act was similar to the Homestead Act in that it was enacted to encourage and promote economic development of the desert lands of the Western states. This act also required the filer to irrigate and cultivate the land within three years. A married couple could pay $1.25 per acre for a maximum of 640 acres whereas a single man would receive half the land but pay the same price. Proof of irrigation was required for the filer to obtain title. This act was later revised to offer a maximum of 320 acres with proof of irrigation required within four years.

The agriculture in the Palo Verde Valley was made possible by the construction of canals and pipelines as well as the securing of water appropriations. The first irrigation project was completed in 1883, after the death of Thomas Blythe who made the first appropriation (E. Warren et al. 1981). The valley was subject to flooding until after the completion of Boulder Dam in the 1930s.

4.3.4 City of Blythe

Thomas Blythe, an Englishman, arrived in the area in 1882 in search of gold and real estate development possibilities. Having been successful in real estate investments in San Francisco, Blythe came to the Lower Colorado River area and established water rights along the Colorado River. His efforts in irrigation and cultivation of the land were successful; 40,000 acres were irrigated as a result of his diverting water from the Colorado River (Blythe Chamber of Commerce 2011). Further development of the desert lands into fertile agricultural fields continued. The city was incorporated in 1916.

4.3.5 World War II Desert Training Center/California-Arizona Maneuver Area

A comprehensive historic context for the Desert Training Center/California-Arizona Maneuver Area (DTC/C-AMA) was published by Bischoff in 2000. The following is a very brief summary of Bischoff's (2000) report.

Soon after the United States entered World War II, General George S. Patton, Jr. was assigned the task of developing a training center to prepare Army troops for combat against German forces in North Africa. Patton identified an area in the California desert that offered realistic terrain and combat conditions to train the troops. The lack of water, extreme heat and difficult terrain as well as the remote location would assist preparing troops for mobilization and combat tactics. Ultimately, training missions were both ground and air; all manner of equipment and battle strategies were tested and perfected there (Bischoff 2000).

Patton established base operations headquarters at Camp Young, near Indio, and began training troops in April 1942. The Desert Training Center (DTC) facility extended from Desert Center in California to the Colorado River, as far north as Searchlight, Nevada and as far south as Yuma, Arizona. To accommodate the massive number of troops brought to the region, several desert airfields were taken over by the Army in 1942, including the airfield that was to become Blythe Army Air Base (BAAB).The name of the DTC was changed to the California-Arizona Maneuver Area (C-AMA) in October 1943, and the mission of the C-AMA was expanded to include simulation of large-scale operations and logistics beyond exclusively desert warfare tactics.

The DTC/C-AMA consisted of 11 major camps, of which seven were in California and four were in Arizona. The largest camps, Camp Iron Mountain, Camp Granite, and Camp Coxcomb, were north of Desert Center. All of the facilities were connected by railroads and major roads (Vredenburgh 1981).

The DTC/C-AMA was where actual battle simulation was first used. The training offered in surviving the elements, tactical mobility and mastering ordinance and engagement provided unparalleled experience for troops and commanding officers. In April 1944 the facilities began evacuations and closing, eventually being turned back to the U.S. Department of the Interior and private landowners (Bischoff 2000).

4.3.6 Blythe Army Air Base

The Project area is on the eastern side of BAAB that, beginning in 1942, supported the military training missions associated with the DTC/C-AMA and later provided aerial bombardment training between 1942 and 1944. As a cultural resource, BAAB was documented in 2010 as P-33-18837 and evaluated for the NRHP (Mitchell 2010). This report provides a brief summary based on Mitchell (2010) and Wilson (2008; personal communication 2011).

Under the Civil Aeronautics Act of 1938, the Civil Aeronautics Administration (CAA) was charged with developing civilian airfields throughout California that could be used for defense. BAAB had humble beginnings in 1940 as a private, unpaved airstrip, originally known as Intermediate Flying Field Site 21. In addition, Site 21 was intended for emergency landings for flights between Los Angeles and Phoenix. The following year (1941) the Works Progress Administration (WPA) provided funds to upgrade the airfield to two paved runways as part of the National Defense Program, with Riverside County sponsoring the project and maintaining the airfield.

In February 1942, General Patton was tasked to identify a location suitable for training troops in desert warfare as preparation for deployment to North Africa. The selected location became the DTC/C-AMA (see Section 4.3.4) . Construction was planned for DTC airfields at Thermal, Desert Center, Rice and Shaver's Summit (now Chiriaco Summit). Because construction for the Site 21 airfield outside Blythe was already underway, it was incorporated into General Patton's DTC/C-AMA operation and used immediately for air support until the four new airfields became operational.

On April 7, 1942, approval was given for Site 21 to become BAAB, and improvements were begun in preparation for the arrival of the 46th Bombardment Group, whose initial mission was to provide medium bomber crews in support of Patton's rigorous desert warfare training. This group was joined by the 3rd

Observation Squadron to perform observation missions in support of the army ground forces on maneuvers at the DTC. For five months, General Patton oversaw the operations of the DTC/C-AMA, including BAAB. In September 1942, General Henry "Hap" Arnold and Lt. Col. Richard Lee took over command of the base from General Patton; by the end of that year the base population was 800 officers and 5,400 enlisted men. (Wilson 2008).

Construction continued on the base throughout 1942; by December a deep water well, a small hanger, an engineering building, the base theater, four warehouses and 60 barracks had been completed, and four runways with aprons had been paved and were in use. However, by the end of 1942, DTC airfields were operational at Thermal, Rice and Desert Center and support from BAAB was no longer needed. At that point, BAAB was relieved of its DTC air support role and changed to heavy bomber training under the 2nd Air Force. The 34th Bombardment Group was assigned to BAAB; its mission was training in B-17 Flying Fortress and B-24 Liberator aircraft (Wilson 2008). In total, BAAB's direct association with the DTC/C-AMA lasted eight months, from April 1942 to the end of the same year, and its association with General Patton lasted only five months.

In 1943, the base hospital, an officer's club and the pool were opened for use. Also, a mess hall, a base chapel, a barber shop and additional hangers were completed. Numerous bombardment groups trained at the base for the next two years. Included in the troops assigned to the base for short periods were the Women's Army Auxiliary Corps (WAAC) and the 99th Fighter Squadron, also known as the Tuskegee Airmen (Wilson 2008).

By March 1944, the training mission at BAAB began to gear down. Most of the troops had completed training and were deployed to new assignments; no new crews were being assigned to BAAB for training. The DTC was closed in April 1944; BAAB became an alternative landing site for March Field in Riverside. BAAB remained staffed for providing emergency landing for airplanes unable to land at their designated home fields due to weather. By October 1945, BAAB was downgraded to an airfield, being closed and surplus government property the following year. It continued to be used for various training purposes until 1948 when the government transferred the property to the County of Riverside, which currently operates a portion of the property as the Blythe Airport. Farming on the airfield property during the 1970s and 1980s destroyed most of the original buildings and features (Wilson 2008).

4.4 Research Goals

The goal of the inventory and analysis is to provide the BLM and the County of Riverside with information with which to assess potential effects to NRHP and CRHR-eligible archaeological sites and architectural resources within the Project APE to support compliance with the NHPA, NEPA, and CEQA.

This research design guides the interpretation of cultural resources within the Project APE and helps in evaluating their eligibility to the NRHP and CRHR (see Section 6.0). The key research questions presented below address: 1) prehistoric chronology; 2) prehistoric settlement and subsistence; 3) interaction of Native Americans with Europeans and Euroamericans; and 4) 20th century use.

4.4.1 Prehistoric Chronology

Chronology is a key component in understanding prehistoric cultural change in the Palo Verde Valley/Colorado Desert area. In the past, archaeologists in this region have had sparse data to draw from, relying primarily on artifact cross-dating and other relative dating techniques rather than absolute dating techniques.

Research Questions

1. Do diagnostic artifacts from sites in the Project area occur in sufficient numbers and in suitable contexts to allow reliable cross-dating with archaeological sites elsewhere in the Palo Verde Valley/Colorado Desert area?
2. Do artifacts and other evidence from archaeological sites indicate Paleoindian, Archaic or Late Prehistoric period occupation or use of the Project area?
3. Can the characteristics and contexts of ceramics in the Project area allow further refinement of chronological change within the Late Prehistoric Patayan Complex?

Data Requirements

The ages of prehistoric sites can best be determined by using absolute-dating technologies, such as radio-carbon dating of botanical and faunal remains or archaeomagnetic dating of fired clay found in thermal features. Obsidian hydration analysis of tools can sometimes be used for dating sites. Sites containing these types of data (i.e., botanical and faunal remains, thermal features, abundant obsidian) from interpretable contexts are rare in the archaeological record of the Colorado River area.

Relative dating techniques, such as the comparison of ceramic and projectile points found in the Project area with datable types from other regions, can be used to determine the approximate age of artifact collections. In general, the larger the artifact collection one has from a single discrete context or site, the more confidence one will have in the estimated age of the collection. However, while some projectile point and pottery types are excellent chronological markers, the age ranges for other tool types may be very broad, spanning thousands of years.

4.4.2 Prehistoric Settlement and Subsistence

Because of the desert environment, prehistoric settlement and cultural use of the area would have typically been close to reliable water sources or along travel routes between water sources. In addition, for Paleoindian, Archaic and Late Prehistoric period cultures, as well ethnographic cultures, resource gathering strategies would also have been affected by the size and distribution of the human population and the types of plant, animal, lithic and other resources available for exploitation.

Research Questions

1. Did chronological variation in the types of resources exploited reflect environmental change, technological change, or fluctuations in the size and distribution of the human population?
2. Do archaeological sites in the Project area represent base camps, temporary camps, or specific task-related loci?
3. What environmental variables (e.g., water, natural habitats) influenced the use of the site or the distribution of the human population?
4. Are the distribution of prehistoric sites and the contents of the sites associated with known prehistoric trails?

Data Requirements

Faunal and botanical remains from a site indicate the resources available at the particular time and location and their relative importance to the occupants. Temporary camps would typically contain the remains of resources found in the vicinity, while remains from base camps would reflect a wider catchment area. Sourcing of raw materials used for stone tools and the different raw materials identified during debitage analysis can indicate either trade with other prehistoric groups or travel to and use of quarry sites. The presence of thermal features, such as roasting pits; of processing features, such as grinding surfaces; of certain types of tools; and of possible hunting blinds would indicate specific subsistence activities. A regional analysis of the artifacts found at sites may reveal patterns how often

certain artifact or raw material classes are associated with trails, which may in turn indicate trade among groups.

4.4.3 Interaction of Native Americans with Europeans and Euroamericans

The first documented accounts of contact between Native Americans and Spanish explorers are from the mid-18th century, followed by accounts of interaction with Euroamericans in the 19th century. Non-native settlement in the Palo Verde Valley began in the mid-19th century with the influx of mining and homestead activities. Euroamerican settlement and land use practices had profound effects on the native populations.

Research Questions

1. Is there evidence of early European (i.e. Spanish) activity at archaeological sites in the Project area?
2. Do any archaeological sites in the Project area contain artifacts or other evidence suggesting 18th or 19th-century occupation by Native Americans?
3. How did Native American and Euroamerican populations interact, and how did this interaction change as Euroamerican population increase?
4. How did the subsistence practices of Native Americans in the Project area change after Euroamericans land use practices had altered the distribution and abundance of natural resources?
5. How did the introduction of Euroamerican agriculture and domesticated animals affect the artifact assemblages found at Native American sites?
6. How did the Euroamerican mining and transportation activities affect traditional tribal practices?

Data Requirements

Information to address these research questions would most likely be found in Native American habitation sites, should they exist within the Project area. Evidence would be based on how stone tools, pottery, and plant and animal remains at sites from the 19th century compare to similar artifacts and food remains at Late Prehistoric sites. Refuse-filled features with depositional integrity and recognizable association to the specific activities would be of particular value for such an analysis. Particularly valuable would be undisturbed features or other contexts with both Native American and Euroamerican artifacts.

4.4.4 20th Century Use

Major events of the twentieth century in the Project vicinity include small-scale mining, development of roads and railroads, implementation of the Homestead Act of 1862 and Desert Land Act of 1877 and subsequent agricultural activities, and World War II training activities related to the DTC/C-AMA and BAAB.

Research Questions

1. How were land improvements first made under the Homestead Act and Desert Land Act affected by later development of extensive irrigation systems in the Blythe area?
2. Did historic settlement and use of the project area change as transportation into the Blythe area improve?
3. Did the reduced incidence of flooding brought on by the construction of Boulder Dam in the 1930s affect land use in the Project area?
4. Are there differences in the location and contents of archaeological resources associated with the DTC/C-AMA and those associated strictly with BAAB after it was no longer tied to the DTC/C-AMA?

Data Requirements

Research questions related to the twentieth century can often best be answered through archival research supplemented by archaeological data. Existing archaeological information pertaining to the twentieth century use of Palo Verde Valley is minimal, as few historic cultural resources of this period in the surrounding area have been investigated. However, historic artifacts and sites can be used to verify the accuracy of some historic records and maps, to pinpoint locations of documented features, and to understand how land use practices have changed. The locations of individual homesteads and mining claims may be associated with historic roads. Survey and site recording can verify whether facilities shown on World War II-era maps of BAAB are still standing, still exist only as rubble and artifact scatters, or perhaps were never actually built.

5.0 INVENTORY METHODS

5.1 Historic Background and Records Search

POWER conducted a records search at the Eastern Information Center (EIC), housed at the University of California, Riverside (UCR) on April 7, 2011. California Historical Resources Information System (CHRIS) records were reviewed to determine the location of previously recorded archaeological and architectural resources and the locations of prior cultural resource surveys within one mile of the Project APE. Also consulted were the NRHP, Archaeological Determinations of Eligibility (ADOE) provided by the EIC, CRHR, CHL lists, and the California Points of Historic Interest (CPHI). In addition, the online BLM General Land Office (GLO) patent information was consulted. Also consulted were Art Wilson, a local historian, the General George S. Patton Memorial Museum and the Palo Verde Historical Museum and Society.

5.2 Field Methods

POWER conducted a BLM Class III archaeological and historic built environment survey of 3,660 acres of lands within the Project boundary that include the 125-foot ROW of the proposed 230 kV transmission line. These lands included private and BLM-managed public lands. During the surveys, archaeologists walked parallel transects, using 15-meter (50-foot) intervals, to identify archaeological and architectural resources within or adjacent to the APE. The ground surface was visually examined for evidence of prehistoric or historic archaeological materials and historic structures. Visible ground surfaces were examined, including fence lines, drainage channels, and other exposures. No subsurface survey (e.g., shovel test pits) was conducted by POWER. A sub-meter Global Positioning System (GPS) was used to identify the location of each cultural resource. A 235-acre parcel surveyed in 2011 was later removed from the Project APE due to design changes. Sites identified within this parcel are described in this report but will not be affected by the Project. The parcel eliminated from the Project is APN 879090052.

Isolated finds, typically three or fewer prehistoric artifacts of the same type (e.g., flakes or sherds), for five or fewer historic artifacts (e.g., cans, bottle glass) were recorded at the time of discovery by collecting GPS data, photographs and measurements of the artifacts. Archaeological sites, typically four or more prehistoric artifacts or six or more historic artifacts within a 10 meter square area, were point-located when discovered and later recorded in more detail during the second field session. Overview photographs of survey areas and comprehensive field notes were also taken.

All field methods were discussed with and reviewed by County Archaeologist, Leslie Mouriquand. The survey on BLM land was performed under Cultural Resource Use Permit (CRUP) #CA-09-36 and Fieldwork Authorization #66.66 11-18.

The archaeological field survey was conducted in three sessions between April and June, 2011. A site visit was attended by POWER archaeologists Jim Rudolph, Gini Austerman, and Dan Woodward on September 7, 2011; a site visit was conducted by Ms. Mouriquand and Riverside County Historic Preservation Officer, Keith Herron on November 22, 2011.

5.3 Native American Communication

Tribal consultation required under Section 106 of the NHPA is ongoing and is being performed by the BLM on a government-to-government basis. Section 106 Tribal consultation is not discussed in this report.

In April 2011, POWER sent a letter to the NAHC requesting information regarding Native American groups with historic ties to, and interest in, the proposed Project area. In May 2011, 20 letters were sent to the tribes identified by the NAHC, which are listed in Table 4. The letter provided a brief description of

the proposed Project and requested information concerning Native American cultural resources in the Project area, as well as any comments or concerns about the Project.

Table 4. Native American Tribes Contacted

AFFILIATION	REPRESENTATIVE
Agua Caliente Band of Cahuilla Indians	Patricia Tuck, THPO
AhaMaKav Cultural Society, Fort Mojave Indian Tribe	Linda Otero, Director
Ah-Mut-Pipa Foundation (Quechan Kumeyaay)	Preston J. Arrow-weed

Torres-Martinez Desert Cahuilla Indians (Cahuilla)	Diana L. Chihuahua, Vice Chairperson, Cultural
Twentynine Palms Band of Mission Indians (Chemehuevi)	Darrell Mike, Chairperson

In November 2011, a Notice of Preparation of an EIR (NOP) was sent via certified mail to 22 Native American Tribes (20 Tribes listed above and additional contacts from the Colorado River Indian Tribe and Torres Martinez Desert Cahuilla Indians). The NOP described the proposed Project and location, environmental review process, potential environmental effects, and contact information, and announced the time and location of the public scoping meeting.

On May 10, 2012, the Applicants hosted an information meeting in Palm Desert and invited Native American groups to attend. Representatives of the Colorado River Indian Tribes, Augustine Band of Cahuilla Indians, Agua Caliente Band of Cahuilla Indians, and Mohave Elders Management attended. Information was presented to them about the Project and about the results of the cultural resource investigations, and the representatives asked questions and expressed concerns. This meeting was an informal coordination meeting with the Applicants only and was not part of BLM government-to-government consultation.

6.0 INVENTORY RESULTS

6.1 Results of Background Research and Record Search

The official federal land record site available through the BLM GLO web site (www.glorecords.blm.gov) patent list was reviewed on June 15, 2011 for homestead information within a one-mile radius of the Project. This land record data can provide background information related to the type of land grant filed, acreage amount and date of issuance. The information is organized by the Township, Range and Section numbers rather than by the APN. One hundred and four (104) land patents were filed within portions of the Project areas between 1911 and 1957; most of the land patents were granted under the Homestead Entry Act of 1862 and the Desert Land Act of 1877. The results are listed in Table C-1 in Appendix C. GLO maps for this part of California were not found online, so it was not possible to use the locations of improvements as a guide for identifying and interpreting historic archaeological sites. Historic military maps and aerial photographs of BAAB were also reviewed (Wilson 2008).

The record search conducted by POWER in March 2011 at the EIC indicated 25 cultural resource studies were previously conducted within one mile of the Project area, eight of which are within or adjacent to the Project. Approximately 20 acres within the current Project had been previously surveyed (RI-03029 and RI-04061); one archaeological site (P-33-009186) and two standing structures (P-33-012532 and P-33-014083) had been previously documented as a result of these studies. The reports are listed in Table 5, and Figure 3 illustrates the areas previously surveyed.

As a result of the record searches performed in April 2011, 82 previously recorded archaeological resources and historic built resources were identified within one mile of the Project (i.e., solar field and proposed transmission line. Information on these resources is presented in Table 5. Of the 82 resources, 28 are prehistoric (16 archaeological sites and 12 isolated finds), 48 are historic (30 archaeological sites, 10 isolated finds, seven built resources, and one district) and 6 are both prehistoric and historic (five archaeological sites and one isolated find). For the purposes of this report, only archaeological and built resources within the Project APE were analyzed.

Three of the 82 cultural resources are within the Project APE. All three are historic (P-33-009186, a refuse deposit recorded in 1999; P-33-012532, a transmission line recorded in 2005; and P-33-014083, a transmission line recorded in 2000). One historic district, the Blythe Army Air Base Historic District (P-33-018837), was recorded in 2010 adjacent to but not within the current Project boundary. These four resources are further described in Section 6.2. One prehistoric site (P-33-018821) appeared to fall within the APE but was incorrectly mapped by the EIC. The previously recorded archaeological and built resources are listed in Table 6; and Figure 4 (in Appendix D) illustrates recorded archaeological resources and standing structures within one mile of the Project APE.

The records search indicates that many prehistoric sites consisting of lithic and ceramic artifact scatters have been documented within a one-mile radius of the Project. The historic sites appear primarily to be refuse deposits and the remains of the World War II training use of the area. POWER anticipated encountering these types of archaeological sites during the survey of the Project area.

6.2 Results of Survey

A total of 35 resources were recorded or updated as part of the BLM Class III survey, as described in Table 7, including four previously recorded resources, seven newly recorded archaeological sites and 24 isolated finds. The resources are both prehistoric and historic. Of the seven archaeological sites, two are prehistoric and five are historic. Of the isolated finds, 17 are historic, six are prehistoric (four contain ceramic sherds, one contains a hammerstone, and the other a tested cobble), and one contained both prehistoric and historic artifacts. Four of the newly recorded resources (P-33-019998, P-33-020002, P-33-020018, and P-33-020019) were within a parcel later removed from the Project, so the resources are now outside the APE. One previously recorded site, P-33-018821, was incorrectly mapped by the EIC and was initially thought to be within the APE. The correct location is actually near the western boundary of the Blythe Army Air Base Historic District outside the Project APE.

During the field survey, four previously documented cultural resources were revisited and their site records updated. These sites are:

- **P-33-009186:** A large World War II-era refuse deposit
- **P-33-012532:** Niland-Blythe 161 kV Transmission Line

- **P-33-014083:** Parker-Headgate Rock-Blythe 161 kV Transmission line
- **P-33-018837:** Blythe Army Air Base Historic District, previously recorded up to but not within the Project boundary.

All resources were updated on Department of Parks and Recreation (DPR) forms, photographed and given updated location maps. The DPR forms can be found in Appendix B. Locations of the identified cultural resources are shown on Figure 5 (see Appendix D).

6.2.1 Archaeological Sites and Built Environment

P-33-009186
Type: Refuse Scatter
Time Period: Historic (1942-1943)
Setting: The site area was recently planted in winter wheat.
Elevation: 350 feet (106 meters) AMSL
Nearest Water Source: The Colorado River is nine miles east
Dimensions: 10 by 30 meters (portion within current Project area)
NRHP and CRHR Eligibility Recommendation: Not Eligible

P-33-009186 is a large World War II-era (but probably not DTC-related) refuse dump, deposited in a pit dug by bulldozers, partially burned, and then incompletely buried. The site was originally recorded by Pigniolo, McGinnis, and Dietler (1999), who recommended that the site be evaluated for the NRHP. During their 1999 survey, they observed .50-caliber shell casings, machine gun clips, bottles, food cans, ceramics, and miscellaneous pieces of metal.

In 2002 and 2003, portions of the site were test excavated, including the part of the site north of Riverside Avenue and within the current Project APE. In January 2002, backhoe trenches were excavated by Tierra Environmental to locate subsurface cultural deposits, evaluate integrity, and identify concentrations of material for further investigation. Additionally, four 0.5-by-1.0- meter units were excavated (Reinoehl 2003). Based on the results of the testing, Tierra determined that the site did not retain integrity or have other characteristics that would make it eligible for the NRHP or the CRHR (Reinoehl 2003).

In 2003, Pigniolo excavated five shovel test pits (STPs) next to Riverside Avenue; three just south of the road and two just north of the road (Pignolio 2003). The STPs were 30 cm in diameter and excavated in 10 cm levels. A close (1 to 2 meter) transect survey was conducted and three areas of concern were identified within Pigniolo's survey area. Test pits were excavated in these areas to evaluate subsurface content and integrity of the deposits. The test pits were excavated to depths ranging between 50 to 70 centimeters. However no cultural material was observed more than 40 cm below surface (Pignolio 2003). Evidence obtained from the testing program indicated the cultural material consisted primarily of construction debris scraped from nearby terraces and was the result of numerous deposition episodes. Although the initial survey identified historic military debris, the results of the testing indicate that the site is primarily a deposit of construction-related debris. Pigniolo found the site did not contain diagnostic artifacts and recommended that it was not eligible for listing in the NRHP, presumably under Criterion D (Pigniolo 2003).

The material Pigniolo found in 1999 and 2003 gave no indication of being associated with BAAB's role in 1942 of providing air support to DTC activities (see Section 4.3.5 and 4.3.6 and description of resource P-33-018837). The large amount of building material throughout the site suggested that the refuse was

deposited at this location at the end of military activity at the Blythe Airport and may be the result of demolition and cleanup of the base prior to the transfer of the land to the county (Reinoehl 2003).

In June 2011, archaeologists from POWER revisited the portion of the site falling within the current Project APE and found it to be in fair condition. A large quantity of historic debris included predominantly food cans and miscellaneous metal pieces. The surface material in the current Project area extends 10 feet north of the road and spans 30 meters east/west. A larger portion of the site extends into the power plant property on the south side of Riverside Avenue outside the Project APE; the construction of the road and plant have damaged the site. The depth of the deposit is unknown for most of the site, but the STPs excavated in 2003 indicated that the depth of the deposit on either side of Riverside Avenue is approximately 40 centimeters. There is a wash cutting into the center of the concentration with debris eroding out of the bank showing the deposit to be over one meter deep in that area. Modern debris is also present at the site and the majority of the material appears to have been burned.

The setting is a generally flat, with low rolling dunes, alluvial soils, and desert creosote scrub vegetation. The ground surface visibility was 90 to 100 percent.

The site has been damaged by grading and construction of Riverside Drive and the power plant. Therefore, it does not retain adequate integrity to satisfy Criterion A of the NRHP/Criterion 1 of the CRHR, because it no longer conveys its association with events that have made a significant contribution to the broad patterns of history, or NRHP Criterion B/CRHR Criterion 2, associated with the lives of significant persons. The site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). Because the site is a secondary deposit, the site does not meet the criteria for NRHP Criterion 4/CRHR Criterion D for containing scientific or historical data. Based on the 2011 survey, the site structure and contents appear to be consistent with Pigniolo's (2003) analysis and recommendations. POWER agrees that research potential has been exhausted with Pigniolo's test excavations. The site, already a disturbed secondary deposit, has been further disturbed by continued modern refuse dumping. POWER recommends that P-33-009186 is not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 6. P-33-009186. SITE OVERVIEW, NORTH OF RIVERSIDE AVENUE, FACING EAST

P-33-012532
Type: Transmission Line
Time Period: Historic (1940s-present)
Setting: Cultivated land, developed landscapes, and open desert.
Elevation: 340-360 feet AMSL
Nearest Water Source: Colorado River is 10 miles east
Dimensions: 2.5 miles long and 100 feet wide within the current Project area
NRHP and CRHR Eligibility Recommendation: Not Eligible

Initially recorded in 2000 as the Niland-Blythe 161 kV Transmission Line, this resource consists of a wooden pole, H-frame transmission line running between the Niland substation in Imperial County and the Blythe substation in Riverside County (Dolan 2000). The line was constructed between the 1940s and 1950s and is part of a system of lines carrying power from the Davis and Parker Dams on the Colorado River to 31 substations (Dolan 2000). The resource was re-recorded in 2005 by Wilson, Kwiatkowski, and Eckhardt, who found the line to be in good condition with various upgrades evident on the wooden poles (Carrico and Eckhardt 2005).

A 100-foot portion of the line was revisited in 2008 by Eckhardt who reported the condition of the resource to be the same as in 2005. The transmission line was recommended not eligible to either the NRHP or the CRHR (CEC and WAPA 2000; Eckhardt and Jordan 2008).

In 2011, archaeologists from POWER revisited the 2.5 miles of the line crossing the current Project area. The resource is in good condition and currently in use. The transmission line, oriented northeast to southwest, consists of wooden H-frame poles. The line crosses dune sand and alluvial soils at an elevation of 340 to 360 feet AMSL, passing through citrus groves, cultivated lands, and developed landscapes.

POWER agrees with previous researchers and recommends that P-33-012532, the Niland-Blythe 161 kV Transmission Line, is not eligible for listing in either the NRHP or the CRHR.

FIGURE 7. P-33-012532. NILAND-BLYTHE 161 KV TRANSMISSION LINE

P-33-014083
Type: Transmission Line
Time Period: Historic (1940-present)
Setting: Cultivated land, citrus groves, developed landscapes, and open desert.
Elevation: 340-360 feet AMSL
Nearest Water Source: Colorado River
Dimensions: 1.9 miles long, 125 feet wide within the current Project boundaries
NRHP and CRHR Eligibility Determination: Not Eligible

Placed into service initially in 1943 and modified and completed in 1951, this linear resource, the Parker-Headgate Rock-Blythe 161kV Transmission Line, consists of 777 H-frame structures placed along 64.4 miles (Pigniolo, Baksh, and Dietler 1999). A 0.8-mile segment of the line was recorded in 1999 and recommended not eligible for listing on the NRHP and CRHR (OHP Status Code 6Z) (CEC and WAPA 2000), although the inventory form and report do not mention the reasons for this recommendation.

In 2011, POWER archaeologists updated the existing site record of the 1.9-mile northeast/southwest segment of the transmission that falls within the current Project area. The transmission line is in good condition and is still in use. The segment in the Project area crosses flat, cultivated alfalfa fields and open desert with dune sand, alluvial soils, and creosote bush scrub vegetation

The original evaluation of this resource recommended that the transmission line does not meet the criteria for the CRHR or the NRHP and therefore is ineligible for listing. POWER agrees and recommends that P-33-014083 is not eligible to either the NRHP or the CRHR.

FIGURE 8. P-33-014083. PARKER-HEADGATE ROCK-BLYTHE 161KV TRANSMISSION LINE, FACING NORTHEAST

P-33-018837
Type: Blythe Army Air Base Historic District
Time Period: Historic (1942-1944)
Setting:. Remains of military base surrounded by the current Blythe Airport, modern industrial/commercial properties, and agricultural fields.
Elevation: 390 feet AMSL
Nearest Water Source: The Colorado River is nine miles east; McCoy Wash is two miles northeast
Dimensions: Approximately 1,500 by 1,600 meters, irregularly shaped
NRHP and CRHR Eligibility Recommendation: Contributing elements to the historic district previously recommended eligible to the NRHP

The Blythe Army Air Base Historic District (P-33-018837) was first recorded by KP Environmental in 2010 (Mitchell 2010a, b). The 1942-1944 airfield known as BAAB originally covered 6,372 acres, but Mitchell recorded only an 829-acre portion of the airfield, roughly the eastern portion of the original base (Mitchell 2010a, b). The remaining 5,543 acres within BAAB were not recorded by Mitchell because they fell outside KP Environmental's project area. However, Mitchell (2010a) noted that although she did not survey land at the Blythe Airport, west of her project area, there appeared to be numerous foundations and other remains associated with 1940s military use on the airport (Mitchell 2010a, b). To the east, Mitchell (2010a, b) documented the property only up to what is now the western boundary of the current Project; none of the structures, runways, taxiways, aprons, or features recorded by Mitchell extended into the current APE.

An audit of the airfield was conducted by the Chief of Engineers in 1946. A total of 473 buildings and structures were listed: 164 housing structures; 47 lavatories/latrines; 38 administrative buildings, warehouses, shops and sheds; 16 mess halls; and 11 hospital buildings (Wilson 2008).

POWER updated the P-33-018837 DPR form with an extended boundary and descriptions of additional features identified during the current survey. The updated DPR form documents only the features and artifacts within the current Project APE immediately east of and adjacent to the portion of BAAB documented Mitchell (2010a, b).

BAAB began in 1940 as an emergency landing strip, Flying Field Site 21. In response to the attack on Pearl Harbor, the War Department began to upgrade existing facilities as part of the National Defense Program. In early 1942, improvements began on the Site 21 airstrip to accommodate the largest military aircraft, but the majority of the buildings were not available for use until the end of that year and into 1943. By December 1942, the base had a deep water well, one hanger, an engineering building, 60 barracks, four warehouses, a theater and four paved runways with aprons. The hospital building was completed in 1943 as was a mess hall, barber shop, base chapel and an additional hanger building.

While BAAB was used for World War II training from 1942 through 1944, the base was used for less than a year by the 46th Bombardment Group to provide air support to the army troops under command of General Patton during desert warfare training operations (see Sections 4.3.4 and 4.3.5). In 1942, airfields were under construction for the DTC at Thermal, Rice and Shaver's Summit, When these fields became operational in late 1942, the 46th Bombardment Group relocated and BAAB ceased its support role for the DTC. BAAB came under command of the Second Air Force for training missions by the 34th Bombardment Group and many other groups until it was returned to civil control in 1947.

During the brief period in 1942 when the 46th Bombardment Group and the 3rd Observation Squadron used the field to support the DTC, troops were housed in tents across the highway from the base, planes were parked and serviced in the open, and medical services were performed in a tent. For this reason, the barracks, hospital, and hangers at BAAB are not directly associated with the DTC.

Although the majority of the original structures at BAAB had been reported by others to have been destroyed, Mitchell documented surface artifacts and 133 features within what she defined as the district boundary (Mitchell 2010a, b). The features documented by Mitchell included tank tracks, concrete

FIGURE 9. P-33-018837. BLYTHE ARMY AIR BASE. CONCRETE FOOTINGS FOR HOSPITAL WING

FIGURE 10. P-33-018837. BLYTHE ARMY AIR BASE. REMAINS OF LATRINES AND SHOWERS AT HOSPITAL WING

FIGURE 11. P-33-018837. BLYTHE ARMY AIR BASE. RUBBLE PILE FROM BARRACKS

FIGURE 12. P-33-018837. BLYTHE ARMY AIR BASE. UTILITY SHOP

foundations, rock lined paths and walkways, oiled gravel roads, taxiways and aircraft use areas, one standing shack, one collapsed structure, a livestock corral and associated shelter, a fence line and several piles of bulldozed rubble . The surface artifacts are primarily cans and soda bottles.

As a result of the 2011 survey, POWER identified four distinct areas within the Project APE that contain remnant features of BAAB. These areas include: 1) the hospital area (Figures 9 and 10); 2) the barracks (Figure 11) and adjacent fire station area; 3) the warehouse area; and 4) the utility shop and yard (Figure 12). All of the buildings that once stood in this portion of BAAB have been demolished with the exception of a utility building (Figure 12). Numerous concrete footings and foundation remains, fire hydrants, manholes, walking paths, and oiled roads remain, and subsurface infrastructure (e.g., water and sewer pipes) may also exist. POWER also recorded three clusters of refuse (Clusters 1, 2, and 3) with artifacts associated with life on the base.

- The hospital area consists of foundations, block walls and dirt paths; no standing buildings remain (Figures 9 and 10). The hospital, once a large concrete building with eight wards and hallways connecting several wings, now consists of eight rows of footings and foundations. A concentration of refuse in the hospital area, designated Cluster 2, contains bottles, ceramics, food cans, beer cans, canning jars, ceramic ashtrays, cold cream jars, toothpaste tubes, and mouthwash bottles. The hospital was built in 1943.

- The barracks area (Figure 11) consists of four building foundation pads and a wall footing with a hardstand apron. The barracks were probably built in the latter part of 1942. A fire station once stood next to the barracks area.

- The buildings in the warehouse area were also demolished; the remains include four foundations for several storage facilities and a cold storage. A large refuse deposit, recorded as Cluster 1, in the warehouse area contained glass and ceramic household debris, machinery parts, and oil and gas cans. Warehouses at BAAB were completed by the end of 1942.

- The utility shop (Figure 12) is still standing, but its entire exterior has been modified by the facing of the original wood siding with metal sheeting. The building has a series of 4-over-4 clearstory windows, many of them damaged. The full monitor roof is relatively intact but has also incurred damage. The building has large bay doors. POWER's evaluation of this building finds that while integrity of location is maintained, integrity of design, materials, and workmanship has been lost. Integrity of setting has been diminished by the removal of most other physical features of the military base. The building is currently used as a maintenance and storage facility.

As mentioned in Section 4.3.5, after the United States entered World War II, General Patton was tasked with developing a training center to prepare Army troops for desert combat. To accommodate the troops brought to the region, several existing airfields were taken over by the Army between 1942 and 1944, including Site 21, which was to become BAAB. BAAB was used for a brief period as support for the DTC.

Numerous other resources have been documented within the larger DTC area far outside the Project APE (Bischoff 2000), including airfields and airports. The other airfields associated with the DTC include:

- Shaver's Summit Airport, recommended not eligible to the NRHP .
- Desert Center Army Airfield, recommended not eligible to the NRHP.
- Essex Airfield, recommended eligible to the NRHP.
- Needles Airport, not yet evaluated.
- Rice Field, recommended eligible to the NRHP.
- Thermal Army Airfield, recommended not eligible to the NRHP.

Mitchell (2010a) recommended the Blythe Army Air Base Historic District as eligible for the NRHP under Criterion A and for the CRHR under Criterion 1 for its association with an event that has made a significant contribution to the broad patterns of history, that is, World War II desert training missions. She also recommended the district as eligible under Criterion B for the NRHP and Criterion 2 for the CRHR for its association with the life of a person important to our past, General George S. Patton. However, a formal determination of eligibility was never made (Lloyd, personal communication 2012).

BAAB's association with the DTC lasted less than a year, and its association with General Patton was even briefer. The barracks, warehouses, fire station, utility building, and hospital within the Project APE were for the most part built and used after BAAB's ties to the DTC and General Patton ended. Nonetheless, BAAB's support for desert training missions continued until 1944. POWER agrees the Blythe Army Air Base Historic District (P-33-018837), including the portion with the APE, is associated with events that have made a significant impact on broad patterns of history (NRHP Criterion A/CRHR Criterion 1). While BAAB as a whole has ties to General Patton and therefore with the life of a significant person (NRHP Criterion B/CRHR Criterion 2), Patton's association with the portion of BAAB in the Project APE is less direct. The only standing structure within the APE is the utility shop, which has retained very little integrity. It is not recommended eligible under NRHP Criterion C/CRHR Criterion 3. Finally, given the temporary nature of much of the original construction, the demolition of the buildings, the extensive archival documentation of BAAB, and the types of likely subsurface features (i.e., sewer and water lines), the portion of BAAB within the Project APE has little potential for significant archaeological information. Therefore, this portion of the resource is recommended not eligible under NRHP Criterion D/CRHR Criterion 4.

After several discussions and site visits with the Riverside County Archaeologist, POWER recommends that despite the limited physical integrity of the features within the Project APE, the portion of BAAB falling within the current Project boundaries contain contributing elements and are, like the historic district, recommended eligible to the NRHP and CRHR. POWER also recommends that the proposed district boundaries be expanded to include the components identified within the Project APE.

P-33-019996 (CA-RIV-10165)
Type: Refuse Scatter
Time Period: Historic
Setting: Agricultural field
Elevation: 391 feet (119 meters) AMSL
Nearest Water Source: There is a seasonal wash 1.5 miles to the south and the Colorado River is 10 miles to the east.
Dimensions: 66 by 42 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

This site consists of a sparse scatter of historic debris covering approximately 0.25 acre (Figure 14). There are no artifact concentrations; rather, all are spread evenly across the surface. Approximately 100 artifacts were counted, including six intact glass bottles and jars, seven glass bottle and jar bases, fragments of glass in a variety of colors, three hole-in-top cans, a crushed oil can and other metal debris, a flag holder, and a porcelain doll leg (Figures 15 and 16). The maker's marks on several of the bottles indicate they were produced between the 1930s and the early 1960s. A K's Fruit Beverage soda bottle dates to 1950 (Toulouse 1971).

The topography is generally flat with low rolling dunes. The site is on land recently cultivated and the dunes are vegetated with creosote bushes and low-growing xeric grasses. The ground visibility was 90 to 100 percent. The site condition is poor due to agricultural activity.

P-33-019996 contains general household refuse dating to the mid-20th century. The refuse appears to be secondary deposition from multiple sources and episodes over a 30-year period. The artifacts do not appear to be related to a specific location or activity.

There is no evidence this site is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). This site and the artifacts are typical of refuse disposal sites common to the area. There is no archaeological evidence (e.g., buried deposits) to suggest that important scientific or historical data may be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, P-33-019996 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 13. P-33-019996. SITE OVERVIEW, FACING SOUTH

FIGURE 14. P-33-019996. K'S FRUIT BEVERAGE BOTTLE

FIGURE 15. P-33-019996. COCA-COLA BOTTLE BASE, "LOS ANGELES, CALIF"

P-33-019997 (CA-RIV-10166)
Type: Refuse Scatter
Time Period: Historic (post-1945)
Setting: Agricultural field
Elevation: 373 feet (113 meters) AMSL
Nearest Water Source: There is a seasonal wash 0.2 mile to the south and the Colorado River is 10 miles to the east.
Dimensions: 50 by 10 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

The site consists of two concentrations of historic debris, primarily cans and glass (Figure 17). Concentration 1 contains 15 cans and one bottle in a 5-by-5-meter area. Concentration 2 covers a 10-by-5-meter area 15 to 20 meters north of Concentration 1. Concentration 2 contains numerous sanitary cans, bottle bases, a "Velvet" tobacco tin (Figure 18), a plastic key chain with a Mobil Oil logo and "1958" printed on it (Figure 19), and metal debris. Based on the presence of jars or bottles with diagnostic

maker's marks (Toulouse 1971) and the keychain, the age of the site likely falls between the late 1950s and late 1960s.

The site is in an agricultural field covered in aeolian sands and sparsely vegetated with low-growing grasses, creosote, chamise, and Palo Verde trees. The topography is generally flat with low rolling dunes. The ground surface visibility was 90 to 100 percent. The condition of the site is poor as the artifacts have been disturbed by disking and other agricultural activities.

P-33-019997 contains general household refuse from the mid-to-late 20th century. There is no evidence to suggest that this site is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). P-33-019997 is typical of refuse disposal sites common to the area. There is no archaeological evidence (e.g., buried deposits) to suggest that important scientific or historical data may be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, P-33-019997 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 16. P-33-019997. SITE OVERVIEW, FACING SOUTH

FIGURE 17. P-33-019997. VELVET TOBACCO TIN

FIGURE 18. P-33-019997. MOBIL OIL COMPANY KEY CHAIN, 1958

P-33-019998 (CA-RIV-10167)
Type: Refuse Scatter
Time Period: Historic
Setting: Agricultural field
Elevation: 391 feet (119 meters) AMSL
Nearest Water Source: There is a seasonal wash 0.2 mile to the northeast and the Colorado River is 10 miles to the east.
Dimensions: 77 by 70 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

Because of modifications to the Project boundaries after completion of the cultural resource survey, P-33-019998 no longer falls within the Project APE.

P-33-019998 consists of a dense scatter of historic refuse mixed with modern trash (Figure 20). Approximately 100 domestic and other artifacts were seen, including hole-in-top cans, sanitary cans, juice cans, porcelain fragments (Figure 21), clear glass bottles, and canning jars manufactured from 1937 to 1977 (Whitten n.d.).

The site condition is poor; it has been affected by past agricultural activity and recent dumping. The topography is generally flat with low, rolling dunes vegetated with creosote bushes and low-growing xeric grasses. The ground surface visibility was 90 to 100 percent.

P-33-019998 contains household refuse dating from the 1930s to the1970s, likely the result of numerous depositional episodes. The site consists of secondary deposits that lack evidence this site is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). This site and the materials found are typical of refuse disposal sites common to the area. There is no archaeological evidence to suggest that important scientific or historical data may be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, P-33-019998 is recommended not eligible for inclusion in either the NRHP or the CRHR.

P-33-019999 (CA-RIV-10168)
Type: Refuse Scatter
Time Period: Historic
Setting: Agricultural field
Elevation: 392 feet (119 meters) AMSL
Nearest Water Source: There is a seasonal wash 1.2 miles to the south and the Colorado River is 10 miles to the east.
Dimensions: 67 by 58 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

P-33-019999 is a scatter of historic refuse with modern trash mixed in (Figure 22). More than 100 artifacts were seen, including whiteware (Figure 23) dating to the early 1940s (Kovel and Kovel 1986), hobbleskirt Coca-Cola bottles produced between 1916 and 1957 (Bates 2011), sanitary cans, and porcelain.

FIGURE 19. P-33-019998. SITE OVERVIEW, FACING SOUTH-SOUTHWEST

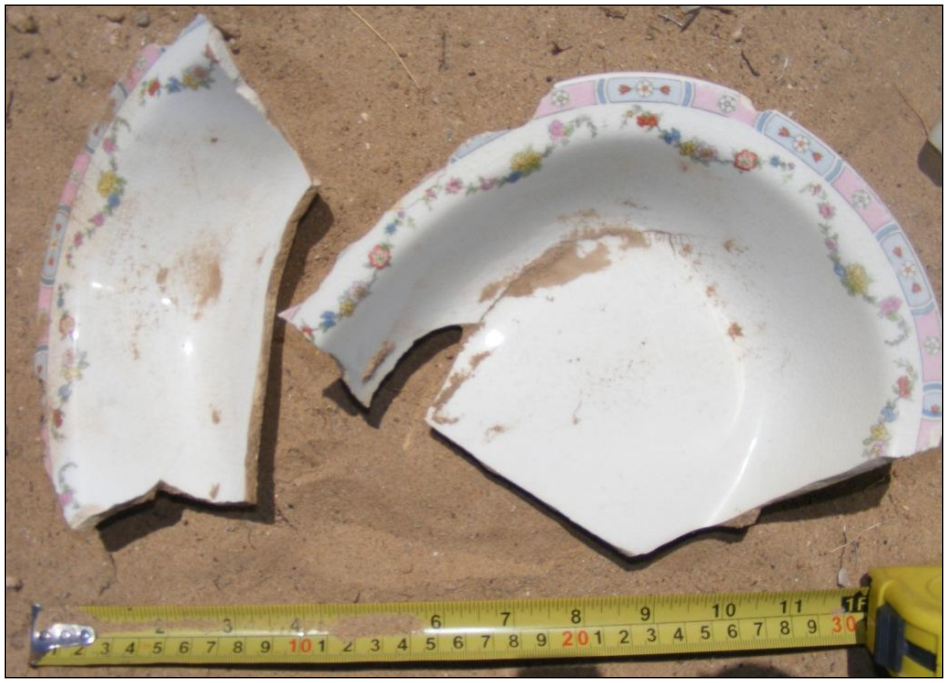

FIGURE 20. P-33-019998. BOWL FRAGMENTS

The topography is generally flat with low, rolling dunes vegetated with creosote bushes and low-growing xeric grasses. The ground visibility was 90 to 100 percent. The site condition is poor; it has been affected by past agricultural activities, recent dumping and construction of concrete pads and poles.

Although the artifacts at the site date to the mid-20th century, there is no evidence to suggest this site is associated with events that have made a significant contribution to the broad patterns of history (NRHP

Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). This type of site and the material within it are typical of refuse disposals common to the area. There is no archaeological evidence to suggest that important scientific or historical data may be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, P-33-019999 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 21. P-33-019999. SITE OVERVIEW WITH PUSH PILE, FACING SOUTHEAST

FIGURE 22. P-33-019999. WHITEWARE DISH WITH HOMER LAUGHLIN MAKER'S MARK, JANUARY 1943

P-33-020000 (CA-RIV-10169)
Type: Historic Refuse Scatter
Time Period: Historic (1950s-1960s)
Setting: Agricultural field
Elevation: 392 feet (119 meters) AMSL
Nearest Water Source: McCoy Wash is three miles northeast and the Colorado River is ten miles east
Dimensions: 36 by 70 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

P-33-020000 (Figure 23) is a sparse historic refuse scatter mixed with modern debris. The artifacts include church-key opened sanitary and combination cans manufactured between 1952 and 1960 (Goodman 2002), aluminum pull-top cans dating to the early 1960s (Goodman 2002), clear and brown glass fragments, and clear glass soda bottles.

The site is in an area recently planted in winter wheat; the surrounding area is generally flat with low, rolling dunes. The vegetation consists primarily of creosote bushes and low-growing xeric grasses. The ground surface visibility was 90 to 100 percent.

The artifacts at P-33-020000 cannot be linked to events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). This material found at the site is typical of refuse disposal sites common to the area. There is no archaeological evidence to suggest that important scientific or historical data may be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, P-33-020000 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 23. P-33-020000. SITE OVERVIEW, FACING SOUTH

P-33-020001 (CA-RIV-10170
Type: Ceramic Scatter
Time Period: Prehistoric
Setting: Agricultural field
Elevation: 390 feet (118 meters) AMSL
Nearest Water Source: There is a seasonal wash 0.6 mile to the northeast and the Colorado River is 10 miles to the east.
Dimensions: 17 by 17 meters
NRHP and CRHR Eligibility Recommendation: Not eligible

P-33-020001 (Figure 24) consists of 16 ceramic vessel fragments, most resembling Lower Colorado Buffware (Society for California Archaeology 2011). Several of the sherds have a gray exterior with dark gray/black interior (Figure 25), but most are tan. Two of the tan sherds also have a possible white decoration (Figure 26). White designs have been found on Lower Colorado Buffware pottery from other sites (Simon n.d.). The sherds range in size from 3-by-1 centimeters to 6-by-5 centimeters. Thickness is 5 to 6 millimeters. The temper is large-grained with flecks of mica. There are no rim or base sherds in the assemblage. The age range for Lower Colorado Buffware is A.D. 1500 to post-1800 (Waters 1982; Seymour and Lawrence 1997).

The site is in an agricultural field. The topography is generally flat with low, rolling dunes vegetated with creosote bushes and low-growing xeric grasses. Disturbances to the site are from agricultural activity.

Because P-33-020001 contained only 16 prehistoric sherds on the surface of a plowed field, no evidence suggests this site is associated with events that have made a significant impact on the broad patterns of history (NRHP Criterion A/CRHR Criterion 1) or that this site is associated with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The limited number and range of artifacts and the level of agricultural disturbance suggests that the site has little potential to provide additional scientific information (NRHP Criterion D/CRHR Criterion 4).

Therefore, P-33-020001 is recommended not eligible to either the NRHP or the CRHR.

FIGURE 24. P-33-020001. SITE OVERVIEW, FACING SOUTH

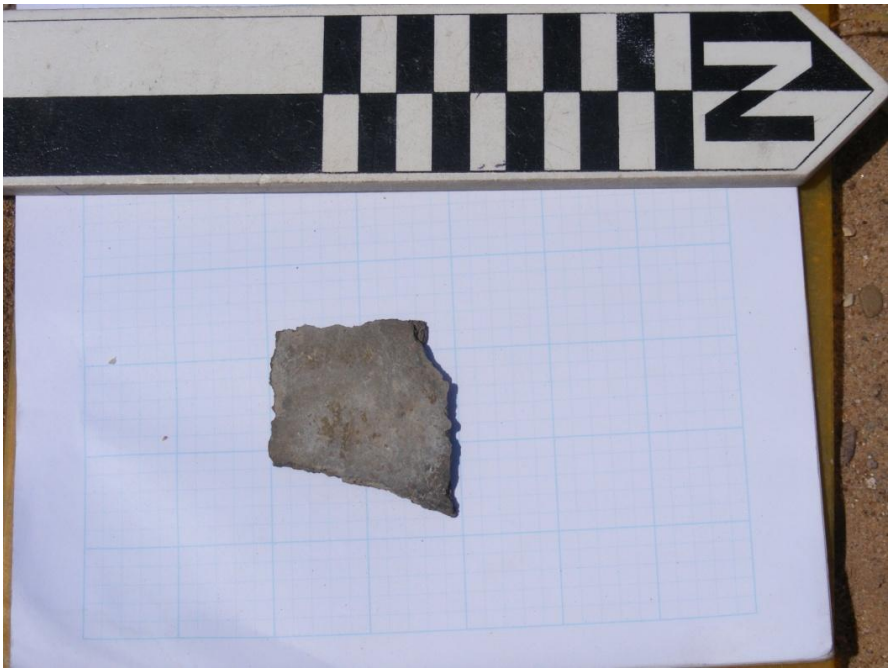

FIGURE 25. P-33-020001. GRAY SHERD

FIGURE 26. P-33-020001. LOWER COLORADO BUFFWARE SHERDS

P-33-020002 (CA-RIV-10171)
Type: Ceramic Scatter
Time Period: Prehistoric
Setting: Agricultural field
Elevation: 390 feet (118 meters) AMSL
Nearest Water Source: There is a seasonal wash 0.2 mile to the south and the Colorado River is 10 miles to the east.
Dimensions: 17 by 17 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

Because of modifications to the Project boundaries after completion of the archaeological survey, P-33-020002 no longer falls within the Project APE.

P-33-020002 consists of eight ceramic sherds of Lower Colorado Buffware (Society for California Archaeology 2011) and three small weathered fragments of indeterminate shell. The exterior of each sherd is rough with accretions; the interior has a smooth finish (Figures 27 and 28). The sherds have a fine paste with a silica temper. The age range for Lower Colorado Buffware is A.D. 1500 to post-1800 (Waters 1982; Seymour and Lawrence 1997).

The site is in a desert landscape of rolling sand dunes of moderate to fine sand. Vegetation includes creosote and desert grasses; the ground surface visibility was 90 to 100 percent.

No evidence suggests that P-33-020002 is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1) or that this site is associated with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The site consists of very little cultural material that has been disturbed by long-term agriculture, limiting its information potential (NRHP Criterion D/CRHR Criterion 4).

P-33-020002 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 27. P-33-020002. SHERD, EXTERIOR SURFACE

FIGURE 28. P-33-020002. SHERD, INTERIOR SURFACE

6.2.1 Isolated Finds

For this report, isolated finds are defined as three or fewer prehistoric artifacts of the same type or five or fewer historic artifacts.

During the current survey, POWER identified 24 isolated finds within the Project APE, including 17 historic and 6 prehistoric isolated finds, and one isolated find with both prehistoric and historic artifacts. The 17 historic isolated finds are primarily hole-in-top cans; several bottle fragments were also documented. Four of the prehistoric isolated finds are ceramic sherds and one is a hammerstone and one is a tested cobble. One isolated find included a prehistoric sherd and a hole-in-top can. Most of the isolated ceramic fragments were brown with no decoration. Although prehistoric isolated finds have been found in association to Native American trails, no trails were identified within the current Project area. Isolated finds are not considered either historic properties under NHPA or historical resources under CEQA.

P-33-020003
This isolated find is a complete aqua glass, six ounce hobbleskirt Coca-Cola bottle embossed with "LOS ANGELES, CALIF." on the base. This particular bottle type was produced between 1916 and 1957 (Bates 2011). P-33-020003 is in open desert with low rolling sand dunes and creosote bush; the ground surface visibility was 90 percent.

P-33-020004
This isolated find is a single hole-in-top can measuring 4¼ inches tall by 3 inches in diameter. Production of hole-in-top cans began in 1900 and they are still used for condensed milk today (Rock 1984). P-33-020004 is in open desert with low rolling sand dunes and creosote bushes; the ground surface visibility was 90 percent.

P-33-020005
The isolated find consists of one hole-in-top evaporated milk can measuring 3⅞ inches by 2⅞ inches with a knife opening. Production of hole-in-top cans began in 1900 and they are still used for condensed milk (Rock 1984:100). The can is in an agricultural field covered in aeolian sands and vegetated with creosote, chamise, and Palo Verde trees. The ground surface visibility was 90 percent.

P-33-020006
Isolated find P-33-020006 is one hole-in-top can measuring $2^{9}/_{16}$ inches by 3 inches. Production of hole-in-top cans began in 1900 and they are used for condensed milk today (Rock 1984). This isolated find is

in an agricultural field covered in aeolian sand and vegetated with creosote bushes and Palo Verde trees; the ground surface visibility was 90 percent.

P-33-020007
Isolated find P-33-020007 is a knife-opened hole-in-top can measuring 3 inches in diameter by 4 inches high. Production of hole-in-top cans began in 1900 and they are still used for condensed milk (Rock 1984). This isolated find was found close to a road in a parcel of open land. The area is vegetated with low-growing grasses and native desert shrubs, including creosote. Winter wheat was planted in this area in 2011, and there are cultivated fields on the other side of the road to the east. Modern litter and evidence of plowing or grading is visible throughout the area. The ground surface visibility was 90 to 100 percent.

P-33-020008
This isolated find consists of five cans: three hole-in-top cans, each measuring 2⅞ inches in diameter by 4 inches high, and two very deteriorated sanitary cans. Production of hole-in-top cans began in 1900 and they are still used for condensed milk (Rock 1984). Found near the road in a parcel of open land, the cans are crushed and deteriorating. Winter wheat was planted in this area in 2011. Uncultivated fields and alfalfa fields are on the other side of the road to the east. The area is vegetated with low-growing grasses and native desert shrubs, including creosote; the ground surface visibility was 90 to100 percent.

P-33-020009
Isolated find P-33-020009 is a partial amber glass bottle base with stippling and "Durag…" embossed on the fragment. "Duraglas" was the proprietary name for a process used by the Owens-Illinois Glass Company that began in 1940 and continued until the mid 1950s (Toulouse 1971). The bottle fragment is in an agricultural field; the ground visibility was poor due to dense vegetation.

P-33-020010
Isolated find P-33-020010 consists of a hole-in-cap can measuring 3 by 4⅜ inches, a hole-in-cap can measuring 4⅛ by 4⅞ inches, a rectangular, single- seam meat or tobacco tin measuring 2⅜ inches by 1⅜ by 3¼ inches, and two small aqua glass fragments. All five artifacts were found in a 3.3 by 2.5 meter area. The isolated find is in an agricultural field with 100 percent ground surface visibility. Production of hole-in-cap cans began as early as 1820 and lasted up until 1930 (Rock 1984).

P-33-020011
Isolated find P-33-020011 consists of one hole-in-top can measuring 3 by3⅞ inches, one circular tin measuring $3\frac{5}{16}$ by 1½ inch with a maker's mark of a diamond with a "C" in the center, and one canning jar lid. Production of hole-in-top cans began in 1900 and they are still used for condensed milk (Rock 1984). The isolated find is in an agricultural field with 100 percent ground surface visibility.

P-33-020012
Isolated find P-33-020012 consists of two hole-in-top cans, both crushed, and one tobacco tin. Production of hole-in-top cans began in 1900 (Rock 1984). The isolated find is in an agricultural field with 100 percent ground surface visibility.

P-33-020013
Isolated find P-33-020013 consists of two artifacts: one Late Prehistoric buffware sherd measuring 4 by 3 centimeters with a thickness of 4 millimeters, and one hole-in-top can. Production of hole-in-top cans began in 1900 (Rock 1984) The isolated find is in an agricultural field with 100 percent ground surface visibility.

P-33-020014
Isolated find P-33-020014 consists of two prehistoric ceramic sherds; one measuring 3 by 6 centimeters and 4 millimeters thick, the other measuring 2 by 2 centimeters and 4 millimeters thick. Both are an

untyped brown ware, with chunky large-grained temper, a tan exterior, a reddish interior and fire clouding on both surfaces. The isolated find is near a seasonal drainage in an agricultural field with 100 percent ground surface visibility.

P-33-020015
P-33-020015 is a quartz hammerstone with crushing or pecking on both ends. The isolated find is near a seasonal drainage in an agricultural field with 100 percent ground surface visibility.

P-33-020016
Isolated find P-33-020016 is an untyped brownware sherd with fire clouding on the exterior surface. The sherd measures 8 by 4 centimeters and four millimeters thick. The isolated find is near a seasonal drainage in an agricultural field with 100 percent ground surface visibility.

P-33-020017
Isolated find P-33-020017 consists of an untyped brown ware prehistoric sherd measuring 5 by 3 centimeters and four millimeters thick. This isolated find is near a seasonal drainage in an agricultural field with 100 percent ground surface visibility.

P-33-020018
Isolated find P-33-020018 is a complete Mason jar with a Hazel-Atlas maker's mark, manufactured at the Ada, Oklahoma plant between 1931 and 1964 (Toulouse 1971). The isolated find is in a desert landscape consisting of rolling sand dunes, creosote and chamise. The ground surface visibility was 90 to 100 percent. Because of modifications to the Project after completion of the cultural resource survey, isolated find P-33-020018 no longer falls within the Project boundaries.

P-33-020019
Isolated find P-33-020019 consists of five separate prehistoric ceramic sherds that fit together to make two individual vessel fragments. They are both rim sherds, one 8.0 by 6.9 centimeters and the other 7.0 by 5.3 centimeters. The sherds have a reddish interior and a gray exterior. The paste ranged from a fine to course paste, and some silica was seen in cross-section. This isolated find is in a desert landscape of rolling sand dunes, creosote and chamise. The ground surface visibility was 90 to 100 percent. Because of modifications to the Project after completion of the cultural resource survey, isolated find P-33-020019 no longer falls within the Project boundaries.

P-33-020020
Isolated find P-33-020020 is a single tobacco tin, very weathered with a minimal amount of the red label remaining. The label possibly reads "Velvet." It is in an agricultural field with 100 percent ground surface visibility.

P-33-020021
Isolated find P-33-020021 is a complete Coca-Cola bottle measuring 7¾ by $2\frac{5}{16}$ inches with a one inch mouth. Embossed on the base is "BLYTHE CALIF," and on one side the bottle reads "Coca-Cola" written in script and "Trade Mark Register bottle Pat 0 105529." On the opposite side shows "Coca-Cola" written in script and "Trade Mark Registered Min. Contents 6 Fl ozs." The hobbleskirt bottle of this size and with embossing dates from 1916 to 1957 (Bates 2011). The isolated find is in an agricultural field planted in winter wheat in 2011. The ground surface visibility was 100 percent.

P-33-020022
Isolated find P-33-020022 is a spool-opened oil can measuring $5\frac{9}{16}$ by 4⅞ inches, with a "Piton" maker's mark stamped on the base. The isolated find is in an agricultural field that was planted in winter wheat in 2011. The site area had 100 percent ground surface visibility.

P-33-020023
Isolated find P-33-020023 is a single hole-in-top can measuring $4\frac{7}{16}$ by $3\frac{1}{16}$ inches, knife-opened and in very poor condition. Production of hole-in-top cans began in 1900 and they are still used for condensed milk today (Rock 1984). This isolated find is in an agricultural field planted in winter wheat in 2011. The field had 100 percent ground surface visibility.

P-33-020024
Isolated find P-33-020024 is a tested cobble with one flake scar on both the dorsal and ventral sides. This prehistoric isolated find is in an agricultural field that had been planted in winter wheat in 2011. Ground surface visibility was 100 percent.

P-33-020025
Isolated find P-33-020025 consists of one hole-in-top can measuring $2\frac{3}{16}$ by 2½ inches. Production of hole-in-top cans began in 1900 and they are still used for condensed milk today (Rock 1984). This isolated find is in an agricultural field planted in winter wheat in 2011. The field had 100 percent ground surface visibility.

P-33-020026
Isolated find P-33-020026 is a liquor bottle measuring $11\frac{15}{16}$ by 3⅝ inches, with a paper label and an Owens-Illinois Duraglas maker's mark on the base. The bottle was produced by Plant 9 in Streator, Illinois in 1930 (Toulouse 1971). The isolated find is in an agricultural field planted in winter wheat in 2011. The field had 100 percent ground surface visibility.

6.3 Native American Coordination

As discussed in Section 5.3, *Native American Communication*, POWER contacted the NAHC requesting information regarding Native American groups with historic ties to, and interest in, the proposed Project area. In May 2011, POWER sent letters to 20 tribes identified by the NAHC (see Table 4 and Appendix A) requesting information concerning Native America cultural resources in the Project area. Responses were received from the Aqua Caliente Band of Cahuilla Indians Tribal Historic Preservation Officer (THPO) and the Augustine Band of Cahuilla Indians. The Aqua Caliente Band THPO requested the name of the consultant conducting cultural resource investigations and additional information (phone message dated May 12, 2011). Later, the Aqua Caliente Band requested Native American monitoring during field survey and construction (letter dated June 12, 2011). However, by the time the letter was received by POWER, the field survey had been completed.

The Augustine Band of Cahuilla Indians submitted a letter on May 17, 2011 indicating they were unaware of specific cultural resources that may be affected by the Project and encouraging contact with Native American Tribes and individuals in the immediate vicinity of the Project site, contracting with a qualified construction monitor, and notifying the Augustine Band should cultural resources be discovered during the development of the Project.

In November 2011, a CEQA Notice of Preparation (NOP) of an EIR was sent via certified mail to 22 Native American Tribes (see Section 5.3). The NOP described the proposed Project and location, environmental review process, potential environmental effects, and contact information, and announced the time and location of the public scoping meeting.

In April 2012, 22 Native American Tribes were sent invitations to an informational meeting. This was an informal meeting hosted by the Applicants, which the BLM and County attended; however, the informational meeting was not part of the BLM government-to-government consultation. Representatives of the Colorado River Indian Tribes, the Augustine Band of Cahuilla Indians, the Agua Caliente Band of Cahuilla Indians, and the Mohave Elders Management attended. Information was presented to them about

the Project and about the results of the cultural resource investigations, and the representatives asked questions and expressed concerns.

Tribal consultation required under Section 106 is being performed by the BLM on a government-to-government basis; this consultation has begun and is ongoing.

7.0 IMPACTS/EFFECTS

This section addresses impacts to cultural resources under CEQA and NEPA; however, the process for assessing effects to historic properties under Section 106 of the NHPA is described briefly in Section 7.1. The site-specific effects will be identified in the joint Environmental Impact Report/Environmental Assessment (EIR/EA) prepared in compliance with CEQA and NEPA.

7.1 Effects Under the National Historic Preservation Act

Under Section 106 of the NHPA, adverse effects to a historic property (i.e., a cultural resource eligible for or listed in the NRHP) can include physical demolition, destruction, relocation, or alteration of the property or its immediate surroundings such that the integrity of the property's location, design, setting, materials, workmanship, feeling, or association would be materially impaired or diminished.

Whenever a historic property cannot be avoided by project activities, adverse effects must be resolved through development of either a Memorandum of Agreement or Programmatic Agreement in consultation with the various consulting parties.

Section 106 regulation states that the regulatory definition of "effect," pursuant to 36 CFR 800.16 (i) is that the term means "alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the NRHP." In practice, a direct effect under Section 106 is that which is a "direct physical disturbance of a historic property." Effects that are immediate but not physical in character, such as visual intrusion, and reasonably foreseeable effects that may occur at some point subsequent to the implementation of the proposed undertaking are referred to as "indirect effects."

Direct effects on historic properties in the Project area could result from ground disturbing activities associated with the construction of the solar generation and transmission facilities, such as clearing vegetation, grading roads, installing underground infrastructure, installing tower foundations, and driving supports for solar arrays.

Historic properties can also be subject to indirect effects, such as changes in public access that increase the potential for vandalism.

7.1.1 Assessment of Effects

A total of 31 archaeological and built resources have been identified in the APE, including a portion of Blythe Army Air Base (BAAB) (archaeological resources and one standing building), six other archaeological sites, two transmission lines, and 22 isolated finds. Only one resource—P-33-018837, BAAB—has been previously recommended eligible to the NHRP as the Blythe Army Air Base Historic District. The original boundaries of this resource have been expanded to include the portion within the BMSP APE. As such, this would be the only resource potentially adversely affected by the proposed undertaking.

P-33-018837 would extend into the proposed solar facility site. The principal components of the portion of BAAB within the BMSP APE include:

- **Hospital Area.** The hospital area consists of foundations, block walls, and dirt paths; no standing buildings remain, and there is a concentration of refuse in the hospital area. The hospital was built in 1943.
- **Barracks and Fire Station Area.** The barracks area consists of four building foundation pads and a wall footing with a hardstand apron. The barracks were probably built in the latter part of 1942. A fire station once stood next to the barracks.

- **Warehouse Area.** The warehouse area consists of foundations for several storage facilities and a cold storage and a large refuse deposit. Warehouses at BAAB were completed by the end of 1942.
- **Utility Shop and Yard.** The utility shop is still standing, but its entire exterior has been modified. POWER's evaluation of this building finds that while integrity of location is maintained, integrity of design, materials, and workmanship has been lost. Integrity of setting has been diminished by the removal of most other physical features of the military base.

Each of these components would be in areas of proposed PV panel blocks and access roads, although a small portion of the hospital area near Buck Boulevard would fall outside.

The Project would utilize silicon PV panels configured into trackers, and the trackers configured into blocks. Each block would be made up of six trackers and would be 295 feet long and 140 feet wide. The panels would be supported by micro-piles that would be driven directly into the ground to a depth of 8 to 12 feet using vibration technology. A tracked backhoe would drive piles. Concrete foundations for the drive motors (device used to move drive strut back and forth) would be poured in place, and electrical equipment for the array would be set in place. No blasting or rock breaking is anticipated or proposed. Small truck-mounted cranes or grade-all forklifts would place trackers on support piles.

Within the solar facility, 12-foot-wide dirt access roads would be constructed every 200 to 400 feet to allow access and maintenance of the solar panels.

7.2 Impacts Under the California Environmental Quality Act

Under CEQA, a project is considered to have an impact on the environment if it alters any characteristics of a historical resource that qualify the it for inclusion in the CRHR. Furthermore, it is stated in CEQA that the lead agency may require that reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. CEQA also requires that impacts as defined by PRC 21083.2 must be addressed and mitigated as outlined in PRC 15126.4 and 15331.

Under CEQA, a checklist provides a common set of guidelines that set forth the significance criteria generally applied to cultural resources within the state. The checklist provides questions to be addressed using the following criteria:

- Potentially significant impact
- Less than significant impact with mitigation
- Less than significant impact
- No impact

Three questions pertaining to cultural resources are presented below.

A) Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

B) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

C) Would the project disturb any human remains, including those interred outside of formal cemeteries?

7.2.1 Assessment of Impacts

A total of 31 cultural resources have been identified in the APE, including a portion of BAAB (archaeological resources and one standing building), six other archaeological sites, two transmission lines, and 22 isolated finds. In addition, two archaeological sites and two isolated finds were identified in an area that was later excluded from the APE.

Table 8 summarizes the anticipated impacts on nine cultural resources within the Project area. Isolated finds are not included in Table 8 because none of them are eligible to the CRHR. Under CEQA, impacts would occur only to historical resources (those eligible to the CRHR), unique archaeological resources (none of which have been identified in the Project area), or human remains (none of which have been identified in the Project area). Only one resource—P-33-018837, a portion of BAAB—is recommended eligible to the CRHR. As such, this would be the only resource potentially impacted by the proposed Project.

All nine cultural resources were recorded within the proposed solar field; none were found along the proposed transmission line.

Table 8. Impacts on Cultural Resources

PRIMARY NUMBER	TRINOMIAL	NRHP/CRHR ELIGIBILITY RECOMMENDATION	JURISDICTION	PROJECT COMPONENT	IMPACTS
P-33-009186	CA_RIV-6370	Not Eligible	Private	Solar Field	No Impact
P-33-012532	CA_RIV-7127	Not Eligible	Private	Solar Field	No Impact
P-33-014083	--	Not Eligible	Private	Solar Field	No Impact
P-33-018837	--	Eligible	Private	Solar Field	Impact
P-33-019996	CA-RIV-10165	Not Eligible	Private	Solar Field	No Impact
P-33-019997	CA-RIV-10166	Not Eligible	Private	Solar Field	No Impact
P-33-019999	CA-RIV-10168	Not Eligible	Private	Solar Field	No Impact
P-33-020000	CA-RIV-10169	Not Eligible	Private	Solar Field	No Impact
P-33-020001	CA-RIV-10170	Not Eligible	Private	Solar Field	No Impact

7.2.2 Application of CEQA Significance Thresholds

A) Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

One historical resource, the Blythe Army Air Base (P-33-018837), has been identified as within the Project APE.

Based on the proposed Project site plan, several of the elements of P-33-018837 would be physically removed or altered during Project construction, whereas other elements could be avoided. Cultural resource management recommendations, described in the next section, have been developed in consultation with the Applicants and the Riverside County Archaeologist and Historic Preservation Officer to mitigate the impact from significant to less than significant.

B) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

None of the archaeological sites recorded in the Project area qualify as unique archaeological resources.

C) Would the project disturb any human remains, including those interred outside of formal cemeteries?

No human remains have been previously recorded or discovered during surveys for this Project and, as such, no impacts to this type of resource are anticipated; however, should human remains be discovered on private land at any time during implementation of the Project, construction in the vicinity will halt and the coroner will be contacted immediately (PRC 7050.5). If the coroner determines that the remains do not require an assessment of cause of death and are probably Native American, then the NAHC will be contacted to identify the most likely descendents. Other steps should be implemented according to the requirements of PRC 5097.98.

8.0 RECOMMENDATIONS

Specific cultural resource management recommendations for the expanded P-33-018837 have been developed in consultation with the Applicants and the County Archaeologist. These were developed as part of the CEQA process; mitigation measures to comply with Section 106 of the NHPA and with NEPA will be developed by the BLM and included in the environmental document.

These management recommendations are defined in the Conditions of Approval and pertain to the portion of the Project area that includes privately owned land. The Conditions of Approval specify the following:

- Archaeological monitoring shall be conducted by a qualified county-approved Archaeologist who shall manage and oversee archaeological monitoring of all initial ground disturbing activities and excavations of each portion of the Project site.
- A Special Interest Monitor designated by the General Patton Memorial Museum in Chiriaco Summit, California shall be allowed on-site during all initial ground disturbing activities and excavation of the parcels within the Project site that contain BAAB-related features and artifacts.
- A Tribal Observer designated by the Agua Caliente Band of Cahuilla Indians or other designated Tribal representative shall be allowed on-site when the Project Archaeologist is present during all initial ground disturbing activities and excavations for each portion of the Project site.
- A Cultural Resources Monitoring and Mitigation Plan (CRMMP) shall be submitted to the County Archaeologist and the County Historic Preservation Officer (CHPO). The CRMMP shall address the details of all activities that must be completed in order to reduce the impacts to cultural and historical resources to a level that is less than significant. The CRMMP shall define the roles and responsibilities of cultural resource personnel and provides the timelines for the completion of the required mitigation.

During Project construction, if human remains are encountered on private land, the provisions of State Health and Safety Code Section 7050.5 will apply. This code section states that no further disturbance shall occur until the Riverside County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. If the remains are determined to be Native American in origin, the County Coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner and his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC and granting of landowner permission. The MLD may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials.

If human remains are discovered on BLM land, NAGPRA (25 U.S.C. 3001) provides a process for federal agencies to return certain Native American cultural items—human remains, funerary objects, sacred objects, or objects of cultural patrimony—to lineal descendants and culturally affiliated Indian tribes. NAGPRA includes provisions for unclaimed and culturally unidentifiable Native American cultural items, intentional excavation and unanticipated discovery of Native American cultural items on federal lands, and penalties for noncompliance and illegal trafficking. The Secretary of the Interior's implementing regulations are at 43 CFR part 10.

LEVEL OF SIGNIFICANCE CHECKLIST
For Archaeological Resources
(Must be attached to report)

(Check the level of significance that applies) APN: See table below	Project No: 122512	EA Number:

□ Potentially Significant Impact	**X** Less than Significant With Mitigation Incorporated	□ Less than Significant Impact	□ No Impact

Historic Resources

Would the project:

Alter or destroy a historic site? Yes. A World War II historic district, the Blythe Army Air Base (BAAB) (33-018837), located immediately adjacent to a western boundary of the Project, had been recorded in 2010 and recommended eligible for listing on the NRHP. Although the boundaries of the historic district as recorded in 2010 did not extend into the Project area, remnant features of the BAAB were found by POWER within the proposed solar Project boundaries. These features were documented and added to the existing district record. POWER recommends that the features within the Project area retain sufficient integrity to be considered contributing elements to the district. Site 33-018837 qualifies as a historical resource and would potentially be altered by the proposed Project.

Cause a substantial adverse change in the significance of a historical resource as defined in California Code of Regulations §15064.5? Yes. Based on the proposed Project site plan, several of the elements of 33-018837 would be physically removed or altered during Project construction, while other elements would be avoided. The proposed Project would potentially cause a substantial adverse change in the significance of this historical resource.

Is the resource listed in, or determined to be eligible by the State Resources Commission, for listing in the California Register of Historical Resources (Pub. Res. Code §5024.1)? No. However, site 33-018837 has been recommended eligible to the NRHP by Mitchell (2010). This recommendation has not yet been reviewed by the State.

Findings of Fact: After considerable discussion with the Riverside County Archaeologist, it was agreed that the features of 33-018837 within the Project boundaries retain sufficient integrity to be considered contributing elements to the existing BAAB Historic District. Therefore, POWER recommends that the portion of the BAAB Historic District that extends into the Blythe Mesa Solar Project boundaries qualifies as a historical resource for the purposes of the California Environmental Quality Act (CEQA).

Proposed Mitigation: Cultural resource management recommendations will be developed in consultation with the applicant, the Bureau of Land Management, and the Riverside County Archaeologist and Historic Preservation Officer to mitigate the impact from significant to less than significant. Such measures include:

1. Expansion of the existing BAAB Historic District boundary to incorporate the resource elements of 33-018837.
2. Preparation of a Cultural Resources Management Plant (CRMP) that details resources to be protected, specifies the necessary agency and Native American notifications and coordination, and implements review and approval of the plan by BLM and County of Riverside prior to the start of construction

Monitoring: Monitors will be provided at appropriate times and places on the Project site during construction as specified in the CRMP, including during construction in areas of the former BAAB.

Archaeological Resources

Would the project:

Alter or destroy an archaeological site? No. Four previously recorded resources, seven new archaeological sites, and 23 isolated finds were identified during the survey of the Project area. Only one of the resources (33-018837, discussed above) meets the criteria for either the NRHP or the CRHR and is recommended eligible. For the purposes of CEQA, none of the other resources qualify as unique archaeological resources.

Cause a substantial adverse change in the significance of an archaeological resource pursuant to California Code of Regulations §15064.5? No.

Disturb and human remains, including those interred outside of formal cemeteries? No.

Restrict existing religious or sacred uses within the potential impact area? No.

Findings of Fact: No archaeological resources are recommended eligible for listing in the CRHR not do any qualify as unique archaeological resources under CEQA.

Proposed Mitigation: No specific resource mitigation is necessary.

Monitoring Proposed: A CRMP will be prepared that may, based on agency consultation, stipulate that archaeological and/or Native American monitoring will be conducted in specific areas to protect resources in the event of inadvertent or unanticipated discovery.

EXPERIENCE SUMMARY

Ms. Austerman is an archaeologist with experience in environmental consulting in all phases of cultural resources management. Her experience includes archival research, Phase I, II, and III field investigations, Native American consultation, report preparation, mitigation monitoring, and artifact curation. She has managed approximately 100 cultural resources projects and has prepared documentation under the jurisdiction of Section 106 of National Historic Preservation Act, National Environmental Policy Act, and the California Environmental Quality Act. Ms. Austerman also has experience in laboratory analyses and reporting for prehistoric lithic artifacts, historic artifacts, and marine shell analysis. She has served as a project manager, assistant project manager, field director, and researcher for private environmental planning firms, and city, state, and federal agencies. As a project manager and crew chief, she has prepared proposals, managed budgets and invoices, and managed client relations, field crews, and subconsultants.

PREVIOUS WORK HISTORY

SWCA Environmental Consultants, California

Cultural Resources Project Manager and Archaeologist responsible for conducting and managing cultural resources projects in compliance with CEQA, NEPA, and Section 106 NHPA.

LSA Associates, Inc., California

Cultural Resources Manager and Archaeologist responsible for Phase I resource identification and impact assessments for private development and public infrastructure projects; constraints analyses and feasibility studies; Native American and historical consultation; Initial Study, Mitigated Negative Declaration, Environmental Impact Report and Environmental Impact Statement support services; and projects involving coordination with multiple team members and specialists. Prepared proposals, managed budgets and invoices, and managed clients, field crews and subconsultants. Position required a working knowledge of regulations under CEQA, NEPA, Section 106, and local and county jurisdictions.

Statistical Research, Inc., California

Archaeologist, Crew Chief, and Lab Technician responsible for leading teams of archaeologists in conducting archaeological surveying and mapping projects, as well as a long-term prehistoric data recovery project in the Ballona Wetlands area of Los Angeles. Conducted and participated in over 50 projects within southern California, Arizona, and Nevada. Assisted in lab inventory, cataloguing, and analysis of the archaeological artifacts and human remains and produced over 20 osteological illustrations collected from the wetlands

project.

San Bernardino National Forest, Idyllwild Ranger Station, California

Archaeologist and Crew Chief responsible for the survey, assessment, and recording of archaeological sites located within the Thomas Mountain Range for a fuels reduction program.

LSA Associates, Inc., California

Field Crew Member and Lab Technician responsible for assisting in the excavation of a prehistoric rock shelter shell midden site on the Newport Coast. Assisted in the laboratory inventory and cataloguing of the artifacts from the site.

Statistical Research, Inc., / California State University, San Bernardino, Field School, California

Participated in a four-week field school within the Big Bear region of the San Bernardino National Forest. Tasks completed during the field school included survey and documentation of sites located near the Pan Hot Springs area.

Department of the Navy, MV22 Osprey Project, Robert Stump Training Complex, California & Arizona

Field Director for the survey, documentation, and evaluation of numerous project areas within California and Arizona Naval and Marine bases, including Barry M. Goldwater West, Chocolate Mountains Aerial Gunnery Range, and Camp Pendleton.

Alameda Corridor East, San Gabriel Trench, California

Crew Chief for a cultural resources testing and excavation project for a grade separation within the Alameda Corridor. Excavation of resources built during the Mission period and related to the San Gabriel Mission.

NextEra, Kramer Junction Solar Project, California

Crew Chief for survey, literature review, site documentation, and NRHP evaluation of three historical-period resources at the site of a new solar generation project.

Barrick Goldstrike Mines, Environmental Assessment Services, Nevada

Archaeologist responsible for a field survey for proposed mine expansion project in northern Nevada.

NV Energy, Sunrise Tap LV#1 69 kV Corridor, Nevada

Cultural Resources Specialist responsible for a field survey and site record updates for the repair of existing lines and assessment for proposed additional lines to the transmission system in Las Vegas.

NCP, Microwave and Mobile Radio EA, Nevada

Archaeologist responsible for a field survey and site record updates for and environmental assessment for a proposed new microwave transmission system.

Sheep Creek Channel Invert Restoration Project, California

Cultural Resources Specialist responsible for a literature review, field survey, site record updates, and preparation of cultural resources technical report for the Initial Study for this channel restoration project in San Bernardino County. Research indicated the presence of several historic resources for which current evaluations and updates were conducted.

Monument Fuel Break Project, California

Cultural Resources Specialist responsible for assisting in the preparation of cultural resources technical report and DPR site records for a brush removal project on BLM lands within Riverside County.

San Diego Gas & Electric Company, Sunrise Powerlink EIS/EIR, California

Archaeologist responsible for cultural and paleontological resources services for an approximately 125-mile-long transmission line in San Diego and Imperial counties. Assisted with preparation of cultural resources technical report and EIS / EIR section for alternatives routes.

BLM, Bragg Shooflies Project, California

Cultural Resources Specialist responsible for preparing the BLM Class III cultural resources inventory report for a road-grading trespass on BLM-managed lands Imperial County.

Los Angeles Unified School District, South Region Elementary School No. 3, California

Archaeologist responsible for a literature review for a proposed construction site for the LAUSD.

CAJA, Avenue of the Stars, California

Archaeologist responsible for a literature review for a constraints analysis for a proposed construction site in an undisclosed location on Avenue of the Stars in Los Angeles.

U.S. Army Corps of Engineers, San Gabriel Trench, California

Archaeologist responsible for a literature review for a proposed grade separation project in the cities of Alhambra and San Gabriel in Los Angeles County.

Norco Regional Conservancy, Lake Norconian Club Historic District, California

Archaeologist participating in the ongoing preservation efforts for the National Register listed resource. Responsibilities include consultation with the U.S. Navy Cultural Resources Southwest Division, the California Office of Historic Preservation, the California State Historical Resources Commission, the National Trust for Historic Preservation, the Advisory Council for Historic Preservation, and various state and local preservation organizations and specialists.

Moreno House Preservation, California

Archaeologist participating in the preservation efforts, significance evaluation, and nomination process for the Moreno House in Norco. Responsibilities included consultation with the landowner and the City of Norco Planning Commission and City Council.

NearCal, Lake Elsinore Auto Complex Project, California

Archaeologist responsible for a cultural resources assessment in compliance with CEQA of the proposed Lake Elsinore Auto Complex project located in Lake Elsinore in Riverside County. No resources were identified within the project boundaries.

Leighton Consulting, Fairmount Park Lake Dredging Project, California

Archaeologist responsible for research that indicated a dredging project fell within the boundaries of Fairmount Park, listed as a Landmark of the City of Riverside, as well as numerous significant prehistoric sites. Recommended mitigation measures to reduce the impact to historic resources located within the lake and surrounding landscape features.

City of Highland, Wal-Mart Superstore, California

Archaeologist responsible for a cultural resources assessment of a proposed 20-acre development for the Highland Wal-Mart Superstore in the city of Highland, San Bernardino County. The literature review indicated four cultural resources had been documented within the project boundaries, all of which were determined to be ineligible for inclusion to the National Register of Historic Places and the California Register of Historical Resources in compliance with CEQA.

Riverside County Transportation Commission, Mid-County Parkway, California

Archaeologist responsible for the survey, site testing, data recovery, and artifact illustration in compliance with Section 106 of the NHPA. This project consisted of an approximately 25-mile corridor in which were located a large volume of sensitive prehistoric resources in Riverside County.

Specialty Mines, Cushenbury 21 Mine Reclamation Project, California

Archaeologist responsible for a field survey, historic site evaluation, and recording for a mine reclamation project San Bernardino County in

compliance with CEQA. One previously undocumented historic site was identified and documented during the field survey.

United Engineering, Apple Valley / Bear Valley Environmental Impact Assessment, California

Archaeologist responsible for a cultural resources assessment for the proposed development of the Bear Valley and Apple Valley Residential Project within the town of Apple Valley in San Bernardino County. The project assessment included a field survey and site recording in compliance with CEQA.

City of Adelanto, Target Gateway Initial Study, California

Archaeologist responsible for a cultural resources assessment for a proposed commercial development in Adelanto. The project included a field survey and site recording in compliance with CEQA.

Bergantz Development Corporation, P.I. Market Demolition Project, California

Archaeologist responsible for architectural demolition monitoring for the historic P. I. Market (P-40-041174), in the city of Pismo Beach of San Luis Obispo County. The site had been previously evaluated for inclusion to the California Register of Historical Resources. In compliance with CEQA, the client was required to retain a professional historical archaeologist to document and report any artifacts of relevance located during monitoring of the demolition process that may add materially to the understanding of the building and its place in the history of Pismo Beach.

SunCal, McSweeny Farms Residential Development, California

Archaeologist responsible for participating in a survey that identified 19 prehistoric and/or historic sites within the McSweeny Farms Specific Plan area of potential effects (APE) for the proposed residential development in Riverside County. A testing and evaluation plan was developed which included data recovery, data analysis, and artifact analysis to evaluate the sites regarding their eligibility for inclusion to the National Register of Historic Places in compliance with Section 106 of the NHPA.

South Coast Winery Resort and Spa, CEQA Compliance, California

Archaeologist responsible for a records search and field survey in compliance with CEQA for a new winery in the city of Temecula in Riverside County. No cultural resources were identified as a result of the 109-acre survey.

BMLA Inc., El Cerrito Park Project, California

Archaeologist responsible for conducting an assessment of the proposed 26-acre El Cerrito Park project pursuant to CEQA. The literature review and field survey did not locate any cultural resources within the project.

Thomas Olsen Associates, French Valley Business Center, California

Archaeologist responsible for a literature review and field survey of a commercial development in Riverside County. Identified two prehistoric cultural resources within the project boundary that were potentially significant under CEQA and determined that, based on the proximity to a previously documented village site, there was a high potential for subsurface deposits, features, and artifacts associated with the site. Phase II archaeological evaluation and monitoring were recommended.

City of San Jacinto, Sanderson Avenue Widening, California

Archaeologist responsible for the literature review and field survey to determine that one cultural resource, a portion of the Colorado River Aqueduct (33-11265), crosses below ground under Sanderson Avenue in the city of San Jacinto, Riverside County. No additional resources were identified and no further investigation or monitoring was recommended in compliance with CEQA.

Kroh Architects, Calvary the Brook Project, California

Archaeologist responsible for the literature review and field survey that determined no cultural resources were present within the project boundaries pursuant to CEQA. The project fell within the community of Highgrove, Riverside County.

Lim and Nascimento Engineering Corporation, East Palm Canyon Bridge Widening Project, California

Archaeologist responsible for the literature review and field survey that determined no cultural resources were present within the project boundaries pursuant to CEQA. This project consisted of the cultural resources assessment for the 1.76-acre East Palm Canyon Bridge Widening project in Cathedral City, Riverside County.

California Business Condos, Minthorn Street Project, California

Archaeologist responsible for the historical background research and archaeological field survey of a street project within the city of Lake Elsinore, Riverside County. The survey identified one historical-period residence and related features (33-15437) which were recorded and evaluated for listing with the National Register of Historic Places and the California Register of Historical Resources. The site did not appear to be eligible for listing and, therefore, was not considered a historical resource under CEQA.

Mr. Chuck Hain, Beacon Way Project, California

Archaeologist responsible the cultural resources assessment of the Beacon Way project, located on a 0.4-acre parcel within the City of Riverside. The records search and historic background research indicate that the property is situated within a previously documented historic archaeological site (CA-RIV-4172H) which contains an extensive network of terracing, rockwork, and landscaping as well as a historic water pumping station and associated pipelines known as Mary Evans Booster Station.

Department of Public Works, City of Temecula, Temecula Education Center, California

Archaeologist responsible for the cultural resource excavation monitoring program and report in compliance with CEQA. The project was in Riverside County.

Southern California Edison, Substation Project, California

Archaeologist responsible for a records search and literature review for an approximate 45-mile project including San Timotoe Canyon and Live Oak Canyon roads for a proposed substation project within unincorporated Riverside and San Bernardino counties.

Southern California Edison, San Timoteo Canyon Road Survey, California

Archaeologist responsible for conducting a pedestrian survey of an approximately 10-mile length of San Timoteo Canyon Road in unincorporated Riverside County.

Southern California Edison, Replacement Pole Survey, California

Archaeologist responsible for surveys of deteriorating transmission line structures within Tulare, San Bernardino, and Riverside counties.

Whelton-Mohawk Cultural Survey, Arizona

Archaeologist responsible for a field survey of large tracts of land in Yuma for a federal land transfer project. The survey was in compliance with Section 106 of the NHPA.

U.S. Forest Service, Thomas Mountain Fuels Reduction Survey, California

Archaeologist responsible for a survey that relocated nine previously documented archaeological sites and identified nine previously undocumented archaeological sites Riverside County. The survey area covered approximately 10,000 acres and was conducted in compliance with NHPA.

Nellis Air Force Base, Joint Red Flag Project, Nevada

Archaeologist responsible for a survey in compliance with NHPA of multiple sections of land for potential use in military training maneuvers.

Lewis Homes, Inc., Lakeview, California

Archaeologist responsible for a survey and testing of a large section of land for residential development in Riverside County in compliance with CEQA.

U.S. Air Force, Barry M. Goldwater Range, Arizona

Archaeologist responsible for a survey and the flagging for protection of sensitive sites in Gila Bend during an ordnance removal project. The survey was conducted in compliance with NHPA.

Playa Vista, California

Archaeologist responsible for an excavation in Los Angeles County of a prehistoric and historical-period cemetery site in the Ballona Wetlands. Provided archaeological illustrations of the site.

U.S. Army Corps of Engineers, Prado Dam, California

Archaeologist responsible for construction monitoring of a historical-period site for expansion of the flood-control overflow area north of the Prado Dam in San Bernardino County.

San Bernardino National Forest, Pan Hot Springs, California

Archaeologist responsible for a survey and emergency excavation of a prehistoric site exposed as the result of a fire break.

Irvine Company, CA-ORA-269 Site, California

Archaeologist responsible for the excavation of a rock shelter shell midden site and the laboratory cataloging of artifacts on the Newport Coast in Orange County.

Page 6, fourth paragraph	Insert the following text: "Archaeological resources were divided into two categories: archaeological sites and isolated finds. Isolated finds are here defined as three or fewer prehistoric artifacts of the same type (e.g., flakes or sherds) or five or fewer historic artifacts (e.g., cans, bottle glass), that are spatially discrete from any other artifacts by a minimum distance of 30 meters. Archaeological sites are defined as four or more prehistoric artifacts or six or more historic artifacts within a 10-meter-square area.
Page 10, Table 3, last row	Replace: "RI-8730*" with "RI-8730"
Page 14, second paragraph, beginning with second sentence	Change the following text: "A total of 23 cultural resources were recorded or revisited as part of the BLM Class III survey, as described in Table 5, including 15 previously recorded archaeological sites and isolated finds ~~resources~~ (see Table 4) and eight newly recorded archaeological sites and isolated finds. Of the 23 resources, 14 are archaeological sites, of which seven are prehistoric and eight are historic (one site has both prehistoric and historic components). Nine of the resources within the APE are isolated finds, of which four have prehistoric artifacts and six are historic (one isolated find contained both prehistoric and historic artifacts). There were no architectural resources within the APE."
Page 14, third paragraph, first sentence	Replace with the following: "Of the 15 previously recorded cultural resources within the APE, all had been recorded within the past five years, some as recently as 2011, and did not require updated DPR forms because their conditions had not changed."
Page 18. Third paragraph	Insert the following text: "The site contained nearly 30 complete cans and more than 100 can fragments related to the military use of the area between 1942 and 1944. Most of the cans were in a very small (2.1-by-1.5-meter) area. This concentration included three No. 10 sanitary cans, 20 No. 2 sanitary cans, and one evaporated milk can. The manufacturing age of the cans ranges from the mid-1930s to the 1950s, but it is most likely they were discarded in a single episode. It is possible that the can scatter was deposited during military training activities associated with BAAB."
Page 18, fifth paragraph, last sentence	Insert the following text: "None of the cans and can fragments demonstrate ties with the DTC/C-AMA. The cans date to the 1930s to 1950s and are not described as military-issue (i.e. K- or C-ration tins).
Page 19, eighth paragraph	Change the following text: "ASM Affiliates revisited this site in June 2011 to perform detailed recording. Using a metal detector, ~~Applied EarthWorks~~ ASM determined that metal objects may exist beneath the surface. They also reported disturbance to part of the site by off-road vehicles."
Page 28, first paragraph	Insert the following text: "Isolated finds are here defined as three or fewer prehistoric artifacts of the same type (e.g., flakes or sherds) or five or fewer historic artifacts (e.g., cans, bottle glass), that are spatially discrete from any other artifacts by a minimum distance of 30 meters."

MANAGEMENT SUMMARY

This supplemental archaeological resource and built environment survey report has been prepared by POWER Engineers, Inc. (POWER) to summarize the results of a records search, literature review, and survey for archaeological and architectural resources potentially affected by construction, operation, and maintenance of proposed and alternative transmission lines associated with the proposed Blythe Mesa Solar Project (Project). No architectural resources were identified within the portion of the Project area of potential effects (APE) addressed in this supplemental report. This Project, which has been proposed by Renewable Resources Group and Solar Star Blythe Mesa 1, LLC, would be on both private and public land in Riverside County, California. The Blythe Mesa Solar Project Archaeological Resource and Built Environment Survey Final Report (POWER 2013) was submitted to the U.S. Department of the Interior, Bureau of Land Management (BLM) in January 2013; this document is a supplemental report addressing only the APE for the proposed 230 kilovolt (kV) transmission line and two alternatives.

The initial report (POWER 2013) addressed the results of a 2011 survey of the entire 3,587-acre electrical generating facility and associated infrastructure and of a 125-foot-wide corridor along a proposed 4.8-mile transmission line (Alternative 1, the proposed Project). It was later decided by the BLM that, to satisfy the requirements for Section 106 of the National Historic Preservation Act, the proposed transmission line APE should be 300 feet wide rather than 125 feet. Also, the BLM required the survey of two transmission line alternatives, a Northern Alternative and a Southern Alternative. This supplemental report addresses survey of the entire 300-foot off-site corridor of Alternative 1 (including resurvey of the original 125-foot corridor) and survey of the 300-foot off-site corridors of the two alternative transmission lines.

All identified cultural resources were found on BLM-managed land. None are on private land under the jurisdiction of Riverside County.

Table MS-1 presents the cultural resources identified during the inventory of the transmission line APE, ownership, recommended National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) eligibility, and project alternative. All were either archaeological sites or isolated finds. No architectural features were found.

1.0 INTRODUCTION

1.1 Purpose of Report

This supplemental archaeological resource and built environment survey report has been prepared by POWER Engineers, Inc. (POWER) to summarize the results of a records search, literature review, and survey for archaeological and architectural resources potentially affected by construction, operation and maintenance of proposed and alternative transmission lines associated with the proposed Blythe Mesa Solar Project (Project). The purpose of this investigation was to identify archaeological and architectural resources within the area of potential effects (APE) and evaluate these resources for eligibility for listing on the National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR). Archaeological resources, but no architectural resources, were identified within the portion of the Project APE addressed in this supplemental report. This Project, which has been proposed by Renewable Resources Group (RRG) and Solar Star Blythe Mesa 1 (SSBM), would be on both private and public land in Riverside County, California. For purposes of compliance with the California Environmental Quality Act (CEQA), the County of Riverside is the lead agency, and for the segments of the transmission line crossing federal land, the U.S. Department of the Interior, Bureau of Land Management (BLM) is the lead agency. The Blythe Mesa Solar Project Archaeological Resource and Built Environment Survey Final Report (POWER 2013) was submitted to the BLM in February 2013; this document is a supplemental report addressing only the APE for the proposed 230 kilovolt (kV) transmission line and two alternatives.

The initial survey report (POWER 2013) addressed the results of a 2011 inventory of the entire 3,587-acre electrical generating facility and of a 125-foot-wide right-of-way (ROW) along a proposed 4.8-mile transmission line (Alternative 1, the proposed Project). It was later decided by the BLM that, to satisfy the requirements for Section 106 of the National Historic Preservation Act (NHPA), the proposed transmission line APE should be 300 feet wide rather than 125 feet. Also, the BLM required the survey of two transmission line alternatives, a Northern Alternative and a Southern Alternative. This supplemental report addresses survey of the entire 300-foot APE of Alternative 1 (including resurvey of the original 125-foot corridor) and survey of the 300-foot APEs of the two alternative transmission lines (Table 1; Figure 1).

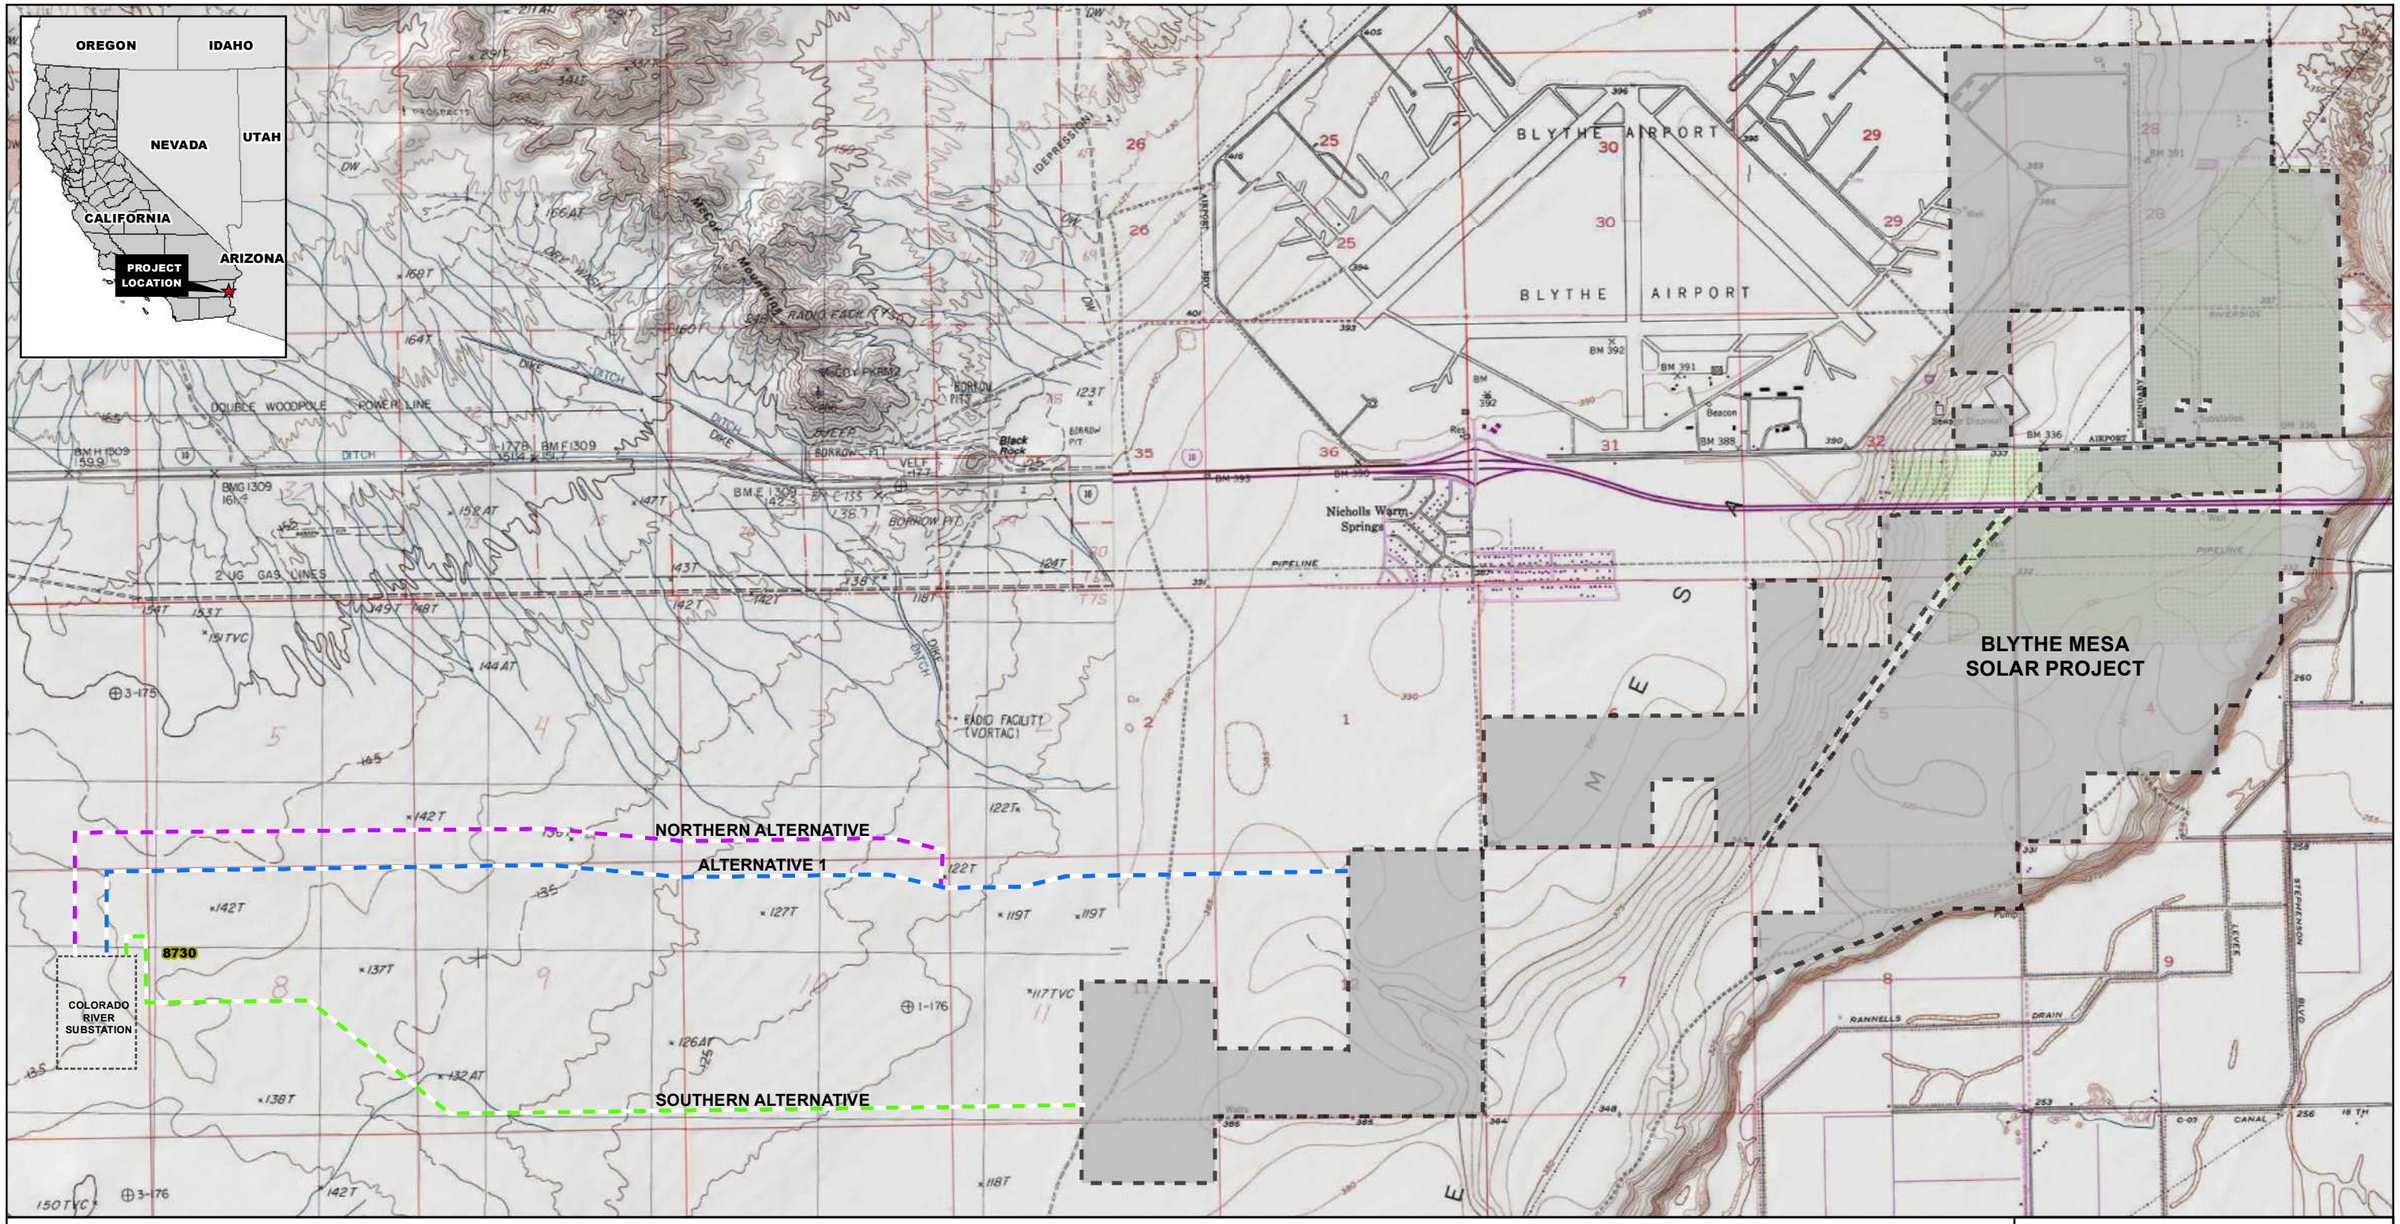

Table 1. APE Acreage and Jurisdiction

	Private Land	BLM-Managed Lands	TOTAL
Solar Facility Site	3,587 acres	0 acres	3,587 acres
230 kV Transmission Line[1]			
Alternative 1[1]	1.0 mile (36 acres)	3.8 miles (138 acres)	4.8 miles (174 acres)[2]
Northern Alternative[1]	0 mile (0 acre)	5.2 miles (189 acres)	5.2 miles (189 acres)[2]
Southern Alternative[1]	0.6 mile (25 acres)	3.4 miles (120 acres)	4.0 miles (145 acres)[2]
Total Project Acreage	3,587 to 3,623 acres	120 to 189 acres	3,732 to 3,776 acres

[1]300-foot-wide corridors outside solar facility site
[2]About 1.5 miles of APE (54 acres) are shared by Alternative 1 and the Northern Alternative.

1.2 Project Overview

A detailed description of the proposed Project is included in the initial survey report (POWER 2013).

THIS PAGE INTENTIONALLY LEFT BLANK

The proposed Project consists of construction and operation of a 485 megawatt (MW) solar photovoltaic (PV) electrical generating facility and associated infrastructure, primarily on private land. The proposed Project would consist of two major components: 1) a solar array field utilizing single-axis solar PV trackers (3,587 acres); and 2) a 230 kV transmission line. The 3,587-acre solar array field would be entirely on private land. The proposed and alternative transmission lines would be built partly within the solar facility and partly off site between the facility and the Colorado River Substation. The ROW for each route would be 125 feet wide, but the APE established by the BLM is 300 feet wide. Depending on which alternative is selected, the transmission line APE would affect an additional 4.8 miles (174 acres), 5.2 miles (189 acres), or 4.0 miles (145 acres) outside the solar facility, primarily on BLM land. The Colorado River Substation site is not included in the APE because the facility has already been permitted and was under construction at the time of the archaeological survey.

The locations of the proposed and alternative transmission lines are on the Roosevelt Mine 7.5-minute U.S. Geological Survey (USGS) Topographic Quadrangles. The transmission line portion of the Project is in Sections 3 through 12 of Township 7 South, Range 21 East, of the San Bernardino Base Meridian.

1.2.1 Proposed 230 kV Transmission Line Location (Alternative 1)

The applicants propose to construct an 8.4-mile-long, 230 kV overhead transmission line from the proposed solar facility to the approved Colorado River Substation (Alternative 1). Approximately 3.6 miles of the transmission line would be within the solar facility. From the edge of the solar facility to the Colorado River Substation, the transmission line would extend another 4.8 miles within a 125-foot-wide ROW (3.8 miles would cross BLM-managed lands and 1.0 mile would cross private land). The transmission line would run parallel and immediately south of the Desert Southwest Transmission Line corridor. The total area of the 125-foot ROW off site would be about 73 acres. The total area of the 300-foot APE off site would be 174 acres (138 acres of BLM-managed land and 36 acres of private land) (Table 1). The parcel numbers of the property included within the Alternative 1 ROW are listed in Table 2.

1.2.2 Northern Alternative 230 kV Transmission Line Location

Similar to Alternative 1, the Northern Alternative would utilize the same alignment within the solar array field and would occupy the same BLM utility corridor. The primary difference between the proposed transmission line and the Northern Alternative is the location of the 230 kV transmission line extending outside the solar array field to the Colorado River Substation. They share a common corridor from the solar array site west for approximately 1.5 miles. At that point, the Northern Alternative would continue west on the north side of the corridor and within a 125-foot ROW entirely on BLM-managed lands, whereas Alternative 1 would continue in a more direct corridor as shown on Figure 1. Under this alternative, the total length of the 230 kV transmission line both on site and off site would be 8.8 miles; 5.2 miles would be off site entirely on BLM-managed lands. The 125-foot easement outside the solar facility boundary (also the BLM portion of the ROW) would contain 79 acres. The total area of the 300-foot APE off site would be 189 acres, all public land (Table 1). The parcel numbers of the property included within the Northern Alternative ROW are listed in Table 2.

1.2.3 Southern Alternative 230 kV Transmission Line Location

The Southern Alternative would exit the southwestern portion of the solar facility and extend approximately 4.0 miles west to the Colorado River Substation within a 125-foot ROW, across 3.4 miles of BLM-managed land and 0.6 mile of private land. The total area of the 125-foot ROW outside the solar array site would be approximately 60 acres. The total area of the 300-foot APE off site would be 145 acres, 120 acres of BLM land and 25 acres of private land (Table 1). The parcel numbers of the property included within the Southern Alternative ROW are listed in Table 2.

2.0 INVENTORY METHODS

2.1 Historic Background and Records Search

Prior to the survey of the transmission line alternatives, POWER archaeologist Johanna Marty conducted a records search at the Eastern Information Center (EIC), housed at the University of California, Riverside on May 31, 2012. California Historical Resources Information System (CHRIS) records were reviewed to determine the location of previously recorded archaeological and architectural resources and the locations of past cultural resource surveys within one mile of the three alternatives. Also consulted were the NRHP, Archaeological Determinations of Eligibility provided by the EIC, CRHR, California Historical Landmarks, and California Points of Historic Interest. In addition, online BLM General Land Office (GLO) patent information was consulted. As part of the initial survey (POWER 2013), POWER had also consulted Art Wilson, a local historian; the General George S. Patton Memorial Museum; and the Palo Verde Historical Museum and Society.

2.2 Field Methods

POWER conducted a BLM Class III archaeological survey of approximately 454 acres of lands within the portions of the proposed and alternative 230 kV transmission line corridors outside the solar facility site. These lands included private and BLM-managed public lands. During the surveys, archaeologists walked parallel transects, using 15-meter (50-foot) intervals, to identify archaeological and architectural resources within the APE. The survey area included 150 feet on each side of the centerline of each alignment (300 feet total for each alignment) including the proposed Project (Alternative 1). The ground surface was examined for evidence of prehistoric and historic archaeological materials and historic structures. There was little vegetation and ground surface visibility was very high. No subsurface survey (e.g., shovel test pits) was conducted. A sub-meter Global Positioning System (GPS) was used to record the location of each cultural resource.

The archaeological field survey was conducted in two sessions in June and July, 2012. Archaeological sites and isolated finds were recorded at the time of discovery by collecting GPS data and photographs and measurements of artifacts. Overview photographs of survey areas were taken and comprehensive field notes were written. Previously recorded sites within the APE were revisited. However, their site records were not updated because they had been recorded or re-recorded within the last five years, sometimes as recently as 2011, and their conditions had not changed.

Archaeological resources were divided into two categories: archaeological sites and isolated finds. Isolated finds are here defined as three or fewer prehistoric artifacts of the same type (e.g., flakes or sherds), or five or fewer historic artifacts (e.g., cans, bottle glass). Archaeological sites are defined as four or more prehistoric artifacts or six or more historic artifacts within a 10-meter-square area.

All field methods were discussed with and reviewed by County Archaeologist, Leslie Mouriquand. The surveys conducted on BLM-managed lands were performed under Cultural Resource Use Permit (CRUP) #CA-09-36, in 2011 under Fieldwork Authorization #66.66 11-18 and in 2012 under Fieldwork Authorization #66.66 12-16.

2.3 Native American Coordination

Tribal consultation required under Section 106 is ongoing and is being performed by the BLM on a government-to-government basis. Section 106 Tribal consultation is not discussed in this report.

Coordination with Native American groups performed as part of the CEQA process in 2011 and 2012 is discussed in the initial survey report (POWER 2013). On May 10, 2012, the Applicants hosted an

information meeting in Palm Desert and invited Native American groups to attend. POWER provided the initial survey report, maps, and inventory forms to several Tribes. Also, two Tribal monitors observed the archaeological survey of the transmission line alternatives in June and July 2012.

3.0 INVENTORY RESULTS

3.1 Results of Background Research and Record Search

Federal land records available through the BLM GLO website (www.glorecords.blm.gov) patent list were reviewed on July 26, 2012 for homestead information within a one-mile radius of the Project. This land record data can provide background information related to the type of land grant filed, acreage amount, and date of issuance. The information is organized by the Township, Range and Section numbers rather than by the Assessor Parcel Numbers (see Table 2). Between 1911 and 1957, 24 land patents were filed within portions of the two-mile-wide study area; most of the land patents were granted under the Homestead Entry Act of 1862 and the Desert Lands Act of 1877. The results are listed in Appendix B. GLO maps for this part of California are not available online, so it was not possible to use the locations of improvements as a guide for identifying and interpreting historic archaeological sites.

The record search conducted by POWER on May 31, 2012 at the EIC showed 19 cultural resource studies were previously conducted within one mile of the alternatives. The reports are listed in Table 3, and Figure 2 illustrates the areas previously surveyed. It is estimated that, before 2012, 39 percent of the Alternative 1 APE had been surveyed (excluding the portion surveyed in 2011 by POWER), 31 percent of the Northern Alternative APE had been surveyed, and 70 percent of the Southern Alternative APE had been surveyed. Much of the land was surveyed as recently as 2010 (Enright and Mirro 2011). All of the 300-foot transmission line APEs were re-surveyed in 2012. Survey did not include any land within the Colorado River Substation, which was already permitted and under construction at the time of survey.

As a result of the record search performed in May 2012, 220 previously recorded cultural resources were identified within one mile of the transmission line alternatives, and 15 cultural resources (archaeological sites and isolated finds) were previously recorded within the 300-foot-wide off-site APE of one or more alternatives. These sites are listed in Table 4. Information on the previously documented resources is in Appendix A; Figure 3, also in Appendix A, depicts the locations of previously recorded cultural resources.

One previously recorded site, P-33-001819 (CA-RIV-1819), appeared on EIC maps to be within the APE of the Southern Alternative. However, other information on the DPR-523 form demonstrates that P-33-001819 was mapped incorrectly and that it falls outside, but within 0.5 mile, of the Southern Alternative APE.

Of the 220 resources recorded before 2011 within one mile of the transmission line alternatives (see Appendix A), 146 are archaeological sites, 66 are isolated finds, and 8 have missing information. None of the resources are standing buildings or structures. Of the archaeological sites, 78 had prehistoric components and 89 had historic components (21 of these sites had both prehistoric and historic components). Of the isolated finds, 44 had prehistoric artifacts, 24 had historic artifacts (four had both prehistoric and historic artifacts), and two inventory forms lacked descriptions on the artifacts found. The prehistoric sites are predominantly lithic and ceramic scatters. The historic sites are primarily refuse deposits, many related to World War II training in the area.

3.2 Results of Survey

The intensive pedestrian survey of the three alternatives was conducted in June and July, 2012 by POWER archaeologists. A total of 23 resources were recorded or revisited as part of the BLM Class III survey, as described in Table 5, including 15 previously recorded resources (see Table 4) and eight newly recorded archaeological sites and isolated finds. Of the 14 archaeological sites, seven are prehistoric and eight are historic (one site has both prehistoric and historic components). Of the nine isolated finds, four have prehistoric artifacts and six are historic (one isolated find contained both prehistoric and historic artifacts). There were no architectural resources within the APE.

During the field survey, 15 previously recorded cultural resources within the APE were revisited. These sites had been recorded within the past five years, some as recently as 2011, and did not require updated DPR forms because their conditions had not changed. Also, as mentioned above, site P-33-001819 (CA-RIV-01819) was placed incorrectly on EIC maps. It falls outside the APE, and was neither revisited nor re-recorded.

Table 6 summarizes the NRHP and CRHR eligibility recommendations for the cultural resources.

The DPR forms for all cultural resources within the APE can be found in Appendix D. Locations of the identified cultural resources are shown on Figure 4 (see Appendix C).

3.2.1 Archaeological Sites

P-33-014150 (CA-RIV-009100)
Type: Two-track road
Time Period: Historic
Setting: Sand dunes; creosote bush scrub
Elevation: 480 feet (146 meters)
Dimensions: 2 by 3,220 meters
NRHP and CRHR Eligibility Determination: Not eligible to NRHP or CRHR

Site P-33-014150 is a two-track road originally recorded by ICF Jones & Stokes in 2005, re-recorded by the same firm in 2008, and re-recorded by TetraTech in 2009 (Carrico and Eckhardt 2005; Eckhardt and Jordan 2008; Carper and Farrell 2009). The northwest/southeast trending road is five to six feet wide. Intermittent segments roughly parallel Power Line Road, which runs along the existing Southern California Edison (SCE) Devers – Palo Verde #1 transmission line. At least nine segments of the road have been identified within two miles. The maps provided by the EIC show a continuous roadway for the entire distance, but the DPR forms prepared in 2005, 2008, 2009 show the roadway as intermittent, with intact segments identified either by field survey or from aerial photographs.

Isolated artifacts found along the road included soda bottles, a sanitary can, ration cans and lids, and a boot sole, suggesting that the road may have been in use during the 1940s, 1950s, and 1960s. GLO maps from 1856 and 1919 and USGS maps were examined in 2008 and 2009, but no road was shown in this

location. Previous researchers suggested the roadway may be the survey road used for the original transmission line survey.

Site P-33-014150 was not seen or re-recorded by POWER. While the road as depicted on EIC maps crosses the APE for the Southern Alternative, POWER did not see any evidence of the road in 2012. It is possible the current APE does not include any of the previously identified segments. It is also possible construction activity in the vicinity in 2012 may have obliterated previously recorded road segments.

The site was recommended by TetraTech as not eligible to the NRHP or CRHR because it does not represent a major road system and was not used in a historically significant context. In addition, the road does not reflect a distinctive type, period, or method of construction. Site P-33-014150 was determined to be not eligible to the NRHP or the CRHR by the California State Historic Preservation Officer (SHPO) in 2009 (Farrell et al. 2009).

P-33-017319 (CA-RIV-009009)
Type: Refuse scatter
Time Period: Historic (World War II)
Setting: Sand dunes; creosote bush scrub
Elevation: 460 feet (140 meters) AMSL
Dimensions: 3 by 5 meters
NRHP and CRHR Eligibility Recommendation: Not eligible

This site was recorded in 2008 (Eckhardt and Jordan 2008) as a small scatter of historic refuse dating to the 1942 to 1944 use of the area by the military. This site was not previously evaluated for NRHP or CRHR eligibility.

Artifacts found in 2008 included 15 cans and one glass jar. Cans included knife-punched evaporated milk cans, which were manufactured after 1931; sanitary cans, some of which may have been opened with a military P-38 opener; one key-wind can; and a key-wind can lid. The maker's mark indicates the glass jar was manufactured after 1937.

POWER revisited site P-33-017319 in 2012 and did not observe any changes, so it was not re-recorded.

The artifacts suggest the can scatter is associated with World War II use of the area. The initial survey report (POWER 2013) summarizes information about Blythe Army Air Base (BAAB) (Mitchell 2010a, b; Wilson 2008) and the Desert Training Center/California-Arizona Maneuver Area (DTC/C-AMA) (Bischoff 2000). BAAB, part of which has been recommended eligible to the NRHP (Mitchell 2010a, b; POWER 2013), was used for military training activities from 1942 through 1944, and this can scatter could have been associated with those training activities. Components of the DTC/C-AMA are also eligible to the NRHP. However, BAAB's direct association with the DTC/C-AMA lasted only eight months, from April 1942 to the end of the same year. None of the artifacts can be dated precisely to that eighth-month period, nor can they can be shown to have a direct association with the DTC/C-AMA.

Because of the nature of this small can scatter, there is no evidence that site P-33-017319 has an important association with specific events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). While General George S. Patton was associated with BAAB and DTC/C-AMA, the cans and jar do not link this site to General Patton or to the lives of any other significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). Site P-33-017319 is typical of small military refuse sites. The site is a small surface scatter of cans and other items; the potential for significant scientific data is low (NRHP Criterion D/CRHR Criterion 4).

Therefore, POWER recommends that site P-33-017319 is not eligible for listing in the NRHP or the CRHR.

P-33-019682 (CA-RIV-009997)
Type: Refuse scatter
Time Period: Historic (World War II)
Setting: Sand dunes; creosote bush scrub
Elevation: 404 feet (123 meters) AMSL
Dimensions: 22 by 6 meters
NRHP and CRHR Eligibility Recommendation: Not eligible

Site P-33-019682 is a historic refuse scatter recorded in 2010 by Applied EarthWorks (Enright and Mirro 2011).

The site contained nearly 30 complete cans and more than 100 can fragments related to the military use of the area between 1942 and 1944. Most of the cans were in a very small (2.1-by-1.5-meter) area. This concentration included three No. 10 sanitary cans, 20 No. 2 sanitary cans, and one evaporated milk can. The manufacturing age of the cans ranges from the mid-1930s to the 1950s, but it is most likely they were discarded in a single episode during military training activities associated with BAAB.

POWER revisited site P-33-019682 in 2012 and did not observe any changes, so it was not re-recorded.

POWER's initial survey report (2013) summarizes information about BAAB (Mitchell 2010a, b; Wilson 2008) and the DTC/C-AMA (Bischoff 2000). BAAB, part of which has been recommended eligible to the NRHP (Mitchell 2010a, b; POWER 2013), was used for military training activities from 1942 through 1944, and this can scatter was probably associated with those activities. BAAB's direct association with the DTC/C-AMA lasted only eight months, from April to December 1942. None of the cans and can fragments demonstrate ties with the DTC/C-AMA.

Because of the nature of this can scatter, there is no evidence to suggest that site P-33-019682 has an important association with specific events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). The artifacts contain no elements that directly link this site to the lives of significant persons, such as General George S. Patton (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). Site P-33-019682 is typical of small military refuse sites. The potential for the site to contain significant scientific data is low (NRHP Criterion D/CRHR Criterion 4).

Therefore, POWER recommends that this site is not eligible for listing in the NRHP or the CRHR.

P-33- 019703 (CA-RIV-010018)
Type: Refuse scatter and fighting hole
Time Period: Historic (World War II)
Setting: Sand dunes; creosote bush scrub
Elevation: 357 feet (108 meters) AMSL
Dimensions: 11 by 8 meters
NRHP and CRHR Eligibility Recommendation: Not eligible

Originally recorded by Applied EarthWorks in 2011 (Enright and Mirro 2011), site P-33-019703 is a single-use temporary military camp consisting of a fighting hole and a small refuse scatter related to the World War II use of the area between 1942 and 1944.

The fighting hole measures about 4 meters by 4 meters and is only 30 centimeters deep. The fighting hole has been eroded and is partially filled. The refuse scatter includes 12 C-ration cans and can fragments and a Barrington Hall Pure Soluble Coffee internal pry-out friction lid cylinder tin. Baker and Company produced Barrington Hall soluble (i.e., instant) coffee before World War I. During World War II, the U.S. Government took over the company.

The site integrity was described by Applied EarthWorks to be fair. The cans have been scattered and partially buried by dune sand; the fighting hole had been partially filled with sand.

POWER revisited site P-33-019703 in 2012 and did not observe any changes, so it was not re-recorded.

POWER's initial survey report (POWER 2013) briefly describes BAAB (Mitchell 2010a, b; Wilson 2008) and the DTC/C-AMA (Bischoff 2000). Part of BAAB has been recommended eligible to the NRHP as a historic district (Mitchell 2010a, b; POWER 2013). BAAB was used for military training activities from 1942 through 1944, and the can scatter and fighting hole were associated with those activities. BAAB's direct association with the DTC/C-AMA lasted only eight months, from April to December 1942. Neither the cans nor the fighting hole can be dated specifically to that eight-month period, nor can they be used to demonstrate a direct link to the DTC/C-AMA.

While there is an association between the fighting hole and can scatter with World War II activities, the limited nature of the material and features suggests site P-33-019703 did not have an important role (NRHP Criterion A/CRHR Criterion 1). The artifacts contain no elements that directly link this site to the lives of significant persons, such as General Patton (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The small quantity and limited variety of cans and the simple nature of the fighting hole indicate that the site's potential to contain significant scientific data is low (NRHP Criterion D/CRHR Criterion 4).

Therefore, POWER recommends that site P-33-019703 is not eligible for listing in the NRHP or the CRHR.

P-33-019714 (CA-RIV-010028)
Type: Isolated tool; refuse scatter
Time Period: Prehistoric and Historic (World War II)
Setting: Creosote bush scrub
Elevation: 361 feet (110 meters) AMSL
Dimensions: 9.5 by 59 meters
NRHP and CRHR Eligibility Recommendation: Eligible pending further investigation

Site P-33-019714 was recorded by Applied EarthWorks in 2011 as a refuse scatter related to the military use of the area. The site also contains a single prehistoric artifact, a quartzite core.

The historic artifacts were found mostly in a 1-meter-by-5-meter concentration of six C-ration cans and lids, and eight Barrington Hall Pure Soluble Coffee cans and lids. Elsewhere on the site there were one crushed sanitary can, one evaporated milk can, six C-ration cans or lids, one piece of milled lumber, and two D-cell batteries. Baker and Company produced Barrington Hall soluble coffee before World War I. During World War II, the U.S. Government took over the company to produce coffee for the military. The artifacts suggest the site was a single-use, temporary campsite.

Using a metal detector, Applied EarthWorks determined that metal objects may exist beneath the surface. They also saw disturbance to part of the site by off-road vehicles.

POWER revisited site P-33-019714 in 2012 and did not observe any changes, so it was not re-recorded.

POWER's initial survey report (POWER 2013) briefly describes BAAB (Mitchell 2010a, b; Wilson 2008) and the DTC/C-AMA (Bischoff 2000). Part of BAAB has been recommended eligible to the NRHP as a historic district (Mitchell 2010a, b; POWER 2013). BAAB was used for military training activities from 1942 through 1944, and the cans found at P-33-019714 were probably associated with those activities. BAAB's direct association with the DTC/C-AMA lasted only eight months, from April to December 1942. None of the artifacts demonstrate direct links with the DTC/C-AMA.

While there is an association between the can scatter with World War II activities, the limited nature of the material suggests that site P-33-019714 did not have an important role (NRHP Criterion A/CRHR Criterion 1). The artifacts contain no elements that directly link this site to the lives of significant persons, such as General George S. Patton (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The small quantity and limited variety of cans suggest the site's potential to contain significant scientific data is low. However, there is evidence that metal objects exist below the ground surface. Further investigation may be warranted to investigate the subsurface remains (NRHP Criterion D/CRHR Criterion 4).

Therefore, POWER recommends that site P-33-019714 is eligible for listing in the NRHP or the CRHR pending further investigation of subsurface deposits.

P-33-019733 (CA-RIV-010047)
Type: Lithic scatter
Time Period: Prehistoric
Setting: Creosote bush scrub
Elevation: 397 feet (121 meters) AMSL
Dimensions: 162 by 70 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

This site was recorded by Applied EarthWorks in 2011 (Enright and Mirro 2011) as a sparse prehistoric lithic assay site containing chert and quartzite tools, flakes and cobbles. The density of artifacts is about one per 230 square meters.

The artifacts reflect opportunistic early-stage reduction of rounded chert and quartzite cobbles. Items include 19 chert artifacts (one biface, one core, one edge-modified flake, five primary flakes, nine secondary flakes, and two tertiary flakes); 15 quartzite artifacts (four tested cobbles, eight primary flakes, two secondary flakes, and one piece of shatter); and four jasper artifacts (three secondary flakes and one tertiary flake).

The site integrity has been affected by vehicular traffic and alluvial activity. A two-track road passes through the site and a seasonal wash runs adjacent to the western border of the site. Applied EarthWorks thought the site was deflated and concluded the artifacts were limited to the surface. Applied EarthWorks considered the site's information potential to be low.

POWER revisited site P-33-019733 in 2012 and did not observe any changes, so it was not re-recorded.

There is no evidence that this prehistoric lithic scatter is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The very low density of artifacts and the observation by Applied EarthWorks that the site is deflated and limited to the ground surface suggest there is little potential for additional information on prehistoric chronology, settlement, or subsistence (NRHP Criterion D/CRHR Criterion 4).

Based upon the previously recorded information about the site (Enright and Mirro 2011), POWER recommends that site P-33-019733 is not eligible for listing in the NRHP or the CRHR.

P-33-019736 (CA-RIV-010050)
Type: Refuse
Time Period: Historic
Setting: Creosote bush scrub
Elevation: 403 feet (123 meters) AMSL
Dimensions: 30 by 15 meters
NRHP and CRHR Eligibility Recommendation: Not eligible

P-33-019736 was originally recorded in 2011 by Applied EarthWorks (Enright and Mirro 2011). The site contains over 50 milled boards next to an abandoned two-track road. There was no evidence of a structure, so Applied EarthWorks concluded the site was the result of dumping. The site also contained wire nails (in boards), steel wire, and a metal gasket for a straight-six cylinder engine.

The boards are in poor condition and are deteriorating due to weathering. The boards vary in length up to 96 inches. Widths and thicknesses varied from 3 by 1 ½ inches to 6 ½ by ½ inches. These are probably nominal two-by-four and one-by-six boards, although the actual dimensions (standardized in 1961) may have been altered by weathering, drying, and warping. Based on weathering, Applied EarthWorks estimated the age of the boards as 40 to 70 years.

POWER revisited site P-33-019733 in 2012 and did not observe any changes, so it was not re-recorded.

Applied EarthWorks did not report any evidence that subsurface deposits were present, although abundant animal burrows at the site might have revealed subsurface material if any was present. There is no evidence this site is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features present to link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The limited variety of artifacts and the lack of subsurface deposits suggest that the potential for the site to yield important scientific or historical data is very low (NRHP Criterion D/CRHR Criterion 4).

Based on the information recorded by Applied EarthWorks (Enright and Mirro 2011), POWER recommends the site is not eligible for either the NRHP or the CRHR.

P-33-019737 (CA-RIV-010051)
Type: Lithic scatter
Time Period: Prehistoric
Setting: Nearly flat; creosote bush scrub
Elevation: 403 feet (123 meters) AMSL
Dimensions: 54 by 44 meters
NRHP and CRHR Eligibility Recommendation: Not eligible

P-33-019737 was recorded by Applied EarthWorks in 2011 as a sparse (one artifact per 80 square meters) scatter of primary and secondary flakes.

The artifacts consist of about 11 primary flakes (five chert, five quartzite, and one vesicular volcanic), 10 secondary flakes (eight chert and two quartzite), one piece of chert shatter, and one quartzite core. Applied EarthWorks concluded that the site represents opportunistic assay and early-state reduction of naturally occurring chert and quartzite cobbles.

The site condition is fair; it appears to be deflated, and an abandoned two-track road bisects the site. Applied EarthWorks concluded that the flakes are likely limited to the surface, although shallow drift sand may obscure a few.

POWER revisited site P-33-019733 in 2012 and did not observe any changes, so it was not re-recorded.

There is no evidence that this site is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The very low quantity and density of artifacts and the observation by Applied EarthWorks that the site is deflated and limited to the ground surface indicate that there is little potential for additional information on prehistoric chronology, settlement, or subsistence (NRHP Criterion D/CRHR Criterion 4).

Based on the information presented by Applied EarthWorks (Enright and Mirro 2011), POWER recommends the site does not meet the criteria for listing on either the NRHP or the CRHR.

P-33-019739 (CA-RIV-010053)
Type: Lithic scatter
Time Period: Prehistoric
Setting: Sand dunes; creosote bush scrub
Elevation: 403 feet (123 meters) AMSL
Dimensions: 40 by 27 meters
NRHP and CRHR Eligibility Recommendation: Not eligible

Site P-33-019739 was originally recorded in 2011 by Applied EarthWorks. The site is a sparse (one artifact per 47 square meters) lithic scatter with primary flakes, secondary flakes, and cores.

The assemblage included sixteen artifacts: six primary flakes (three chert and three quartzite), seven secondary flakes (five chert, one quartzite and one metavolcanic), and three cores (two chert and one quartzite). Drifted sand may have obscured other artifacts. Based on the artifact assemblage, this site may have been used as a prehistoric lithic procurement and processing site (Enright and Mirro 2011). Impacts to the site include wind erosion (deflation), animal burrowing, and sheet wash.

POWER revisited site P-33-019733 in 2012 and did not observe any changes, so it was not re-recorded.

There is no evidence that this lithic scatter is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The very low quantity and density of artifacts, as well as the lack of diagnostic material, show that there is little potential for additional information on prehistoric chronology, settlement, or subsistence (NRHP Criterion D/CRHR Criterion 4).

Based on the information presented by Applied EarthWorks (Enright and Mirro 2011), POWER recommends the site does not meet the criteria for listing on either the NRHP or the CRHR.

P-33-019760 (CA-RIV-010073)
Type: Lithic scatter
Time Period: Prehistoric
Setting: sand dunes; creosote bush scrub
Elevation: 433 feet (132 meters) AMSL
Dimensions: 7 by 57 meters
NRHP and CRHR Eligibility Recommendation: Eligible pending further investigation

This site, recorded in 2011 by Applied EarthWorks (Enright and Mirro 2011), is a small scatter of chert debitage.

The artifacts include three primary flakes, one secondary flake, and one piece of shatter. Given the size of the site, the overall density is one artifact per 63 square meters. Applied EarthWorks interpreted the site as a temporary use area of early-stage lithic reduction activities.

POWER revisited site P-33-019733 in 2012 and did not observe any changes, so it was not re-recorded.

The site has been disturbed by modern off-road vehicle traffic along a two-track crossing the site. Modern dune sands have drifted across much of the site area. Applied EarthWorks suggested the site may be larger than recorded because much of the original ground surface may be covered with dune sand.

There is no evidence that this lithic scatter is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). Applied EarthWorks suggested that modern sand may obscure evidence that the site is more extensive than reflected on the surface. Given this uncertainty, and the lack of subsurface investigation, it is not possible to conclude whether the site may contain information that would help address research questions pertaining to prehistoric chronology, subsistence, or settlement. (NRHP Criterion D/CRHR Criterion 4).

Based on the information presented by Applied EarthWorks (Enright and Mirro 2011), POWER recommends that site P-33-019760 (CA-RIV-010073) may be eligible for listing on the NRHP or CRHR, pending further investigation regarding the presence or absence of subsurface deposits.

P-33-021130 (CA-RIV-10962)
Type: Ceramic scatter
Time Period: Prehistoric
Setting: Open desert
Elevation: 459 feet (140 meters) AMSL
Dimensions: 2.0 by 1.5 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

Site P-33-021130 is a small concentration of 22 prehistoric sherds, all of which are body fragments of Lower Colorado Buffware (Figure 5). The sherds appeared to be from one vessel, although they were not re-fitted. Colorado Buff is Patayan III and dates between A.D. 1500 and post-1900.

The site condition is fair; it has been affected by sheet wash and wind erosion. The topography is generally flat with low, rolling dunes vegetated with creosote bushes and low-growing xeric grasses. The ground surface visibility was 90 to 100 percent.

The site may represent a single prehistoric activity, probably a pot drop, although this was not confirmed through refitting. There is no evidence that this site is associated with events that have made a significant

contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). There are no artifacts other than sherds of the same type, which suggest that important scientific or historical data is not likely to be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, site P-33-021130 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 5. SITE P-33-021130 OVERVIEW, FACING SOUTH-SOUTHWEST

P-33-021131 (CA-RIV-10963)
Type: Ceramic scatter
Time Period: Prehistoric/Protohistoric
Setting: Open desert
Elevation: 462 feet (140 meters) AMSL
Dimensions: 6 by 2 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

This site consists of 10 fragments of prehistoric Lower Colorado Buffware sherds, all of which are body fragments that are probably from the same vessel, although they were not refitted (Figure 6). The sherds have a light brown exterior with a rough interior and coarse gritty temper. Colorado Buff is Patayan III and dates between A.D. 1500 and post-1900.

The topography is generally flat with low, rolling dunes vegetated with creosote bushes and low-growing xeric grasses; the ground visibility was 90 to 100 percent. The site condition is fair; it has been affected by sheet wash and wind erosion.

This site represents a single event, probably a pot drop. There is no evidence this site is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no diagnostic artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The ceramics may represent one vessel, although this was not confirmed

by refitting. There is no archaeological evidence to suggest that important scientific or historical data may be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, site P-33-021131 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 6. SITE P-33-021131 OVERVIEW, FACING NORTHEAST

P-33-021132 (CA-RIV-10964)
Type: Refuse Scatter
Time Period: Historic (1930s to 1940s)
Setting: Open desert
Elevation: 381 feet (110 meters) AMSL
Dimensions: 3.0 by 2.5 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

Site P-33-021132 is a small, compact refuse scatter of more than 25 artifacts recorded by POWER in 2012. Maker's marks on the bottles show the site dates to the 1930s and 1940s.

The topography is generally flat with low rolling dunes (Figure 7). The site is in open desert; the dunes are vegetated with creosote bushes and low-growing xeric grasses. The ground visibility was 90 to 100 percent.

Site P-33-021132 contains general household refuse dating to the early to mid-20th century. The items were evidently discarded at this location in a single episode; there are no roads or two-tracks in the immediate vicinity.

Artifacts from the site include:

- Six hole-in-top cans with ice pick openings; 2 $^{7}/_{8}$ inches in diameter and 3 $^{7}/_{8}$ inches tall. These were evaporated milk cans manufactured between 1900 and 1990 (Horn 2005).
- Six juice cans; 2 $^{5}/_{8}$ inches in diameter and 4 $^{7}/_{8}$ inches tall.

- Two indeterminate cans; 4 ¼ inches in diameter and 7 inches tall.
- Three possible paint cans; 4 ¼ inches in diameter and 4 ¼ inches tall
- One meat can, knife-opened; 3 $^{3}/_{8}$ inches in diameter and 1 ¾ inches tall.
- One clear glass bottle with a bunch of grapes embossed on the front. There is a Northwestern Glass Company maker's mark on the base. This company manufactured bottles from 1931 to the present.
- One amber glass bottle with a metal screw top lid. "Duraglass" is embossed on the heel and an Owens-Illinois maker's mark is on the base. The bottle was manufactured in 1943. (Toulouse 1971; SHA n.d.).
- One clear glass bottle with a black screw top lid. "Listerine" is embossed on the shoulder; "Lambert Pharmaceutical Co." and "Duraglass" are embossed on the heel. It also has an Owens-Illinois maker's mark on the base. The bottle was manufactured in 1942 (Toulouse 1971; SHA n.d.).
- One amber glass Purex bottle with an "LM" maker's mark on the base. The size, design and threaded screw top indicate a manufacture date from 1937, when hard rubber stoppers were replaced with metal screw tops (Sharley 2002). "LM" is the maker's mark for the Latchford-Marble Glass Company from 1938 to 1956 (Whitten n.d.).
- One clear glass ketchup bottle with an Owens-Illinois maker's mark is on the base. The maker's mark indicates that the bottle was manufactured in 1933 (Toulouse 1971).

There is no evidence that this refuse scatter is associated with events that have made a significant contribution to the broad patterns of history (NRHP Criterion A/CRHR Criterion 1). There are no artifacts or features that link this site with the lives of significant persons (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). This site and the artifacts there are typical of refuse disposal sites common to the area. There is no archaeological evidence (e.g., buried deposits) to suggest that important scientific or historical data may be obtained from the site (NRHP Criterion D/CRHR Criterion 4).

Therefore, site P-33-021132 is recommended not eligible for inclusion in either the NRHP or the CRHR.

FIGURE 7. SITE P-33-021132 OVERVIEW, FACING EAST

P-33-021133 (CA-RIV-10965)
Type: Refuse Scatter
Time Period: Historic (World War II)
Setting: Open desert
Elevation: 462 feet (141 meters) AMSL
Dimensions: 15 by 10 meters
NRHP and CRHR Eligibility Recommendation: Not Eligible

Site P-33-021133 is a small refuse scatter consisting of 10 deteriorating K-ration cans, first recorded by POWER in 2012. The site is in an area of open desert among small rolling sand dunes (Figure 8). Disturbance to the site is minimal and the result of sheet wash and wind erosion. The ground surface visibility was excellent at over 90 percent.

Six of the cans measure 2 $^{13}/_{16}$ inches tall by 2 $^{14}/_{16}$ inches wide and are key opened; several strips of metal with an attached twist key opener were also found. Four of the cans measure 4 $^{13}/_{16}$ inches tall by 2 $^{3}/_{16}$ inches wide and are embossed with "Barrington [Hall] Soluble Coffee" on the lid.

K-rations contained an individual daily combat food ration. They were developed by the U.S. Army in 1941 and first used in 1942 by U.S. airborne troops. They were used to the end of the War and were discontinued in 1948.

Baker and Company produced Barrington Hall soluble (i.e., instant) coffee before World War I. During World War II, the U.S. Government took over the company to produce coffee for K-rations.

Information on World War II-era use of the area is presented under site P-33-017319 (CA-RIV-009009). POWER's initial survey report (POWER 2013) briefly describes BAAB (Mitchell 2010a, b; Wilson 2008) and the DTC/C-AMA (Bischoff 2000). Part of BAAB has been recommended eligible to the NRHP as a historic district (Mitchell 2010a, b; POWER 2013). BAAB was used for military training activities from 1942 through 1944, and the can scatter was probably associated with those activities. BAAB's direct association with the DTC/C-AMA lasted only eight months, from April to December 1942. None of the cans demonstrate direct ties with the DTC/C-AMA.

While there is an association between the can scatter with World War II activities, the limited nature of the material suggests site P-33-021133 did not have an important role (NRHP Criterion A/CRHR Criterion 1). The artifacts contain no elements that directly link this site to the lives of significant persons, such as General George S. Patton (NRHP Criterion B/CRHR Criterion 2). This site does not contain architecture (NRHP Criterion C/CRHR Criterion 3). The small quantity and limited variety of cans suggest that the site's potential to contain significant scientific data is low (NRHP Criterion D/CRHR Criterion 4).

Therefore, POWER recommends that site P-33-021133 is not eligible for listing in the NRHP or the CRHR.

FIGURE 8. SITE P-33-021133 OVERVIEW, FACING WEST

3.2.2 Isolated Finds

For this report, isolated finds are defined as three or fewer prehistoric artifacts of the same type or five or fewer historic artifacts.

During the transmission line survey, POWER identified nine isolated finds within the Project APE, including five historic and three prehistoric isolated finds, and one isolated find with both prehistoric and historic artifacts. The historic isolated finds are primarily food cans. The prehistoric isolated finds are lithics or sherds. Isolated finds are not considered either historic properties under the NHPA or historical resources under CEQA.

P-33-019612

This isolated find is actually a number of widely dispersed isolated cans recorded in 2010 by AECOM. AECOM assumed that the cans were once associated with historic archaeological sites, but were re-deposited throughout the area by alluvial action (Vargas 2010). Each can location was recorded separately, but was assigned the same primary number. One can location is within the current APE (Figure 4, Appendix C). The can is related to the World War II military use of the area.

P-33-019704 (CA-RIV-010019)

This isolated find was documented in 2011 by Applied EarthWorks as a small refuse scatter containing only a section of heavy-gauge wire, one tapered meat can, and one cut metal disk (Enright and Mirro 2011).

P-33-019712

Originally recorded by Applied EarthWorks in 2011, this isolated find is a GLO brass-capped survey marker for a quarter section boundary between Sections 7 and 8 of Township 7 South, Range 21 East of the San Bernardino Base Meridian (Enright and Mirro 2011).

P-33-019770

This isolated find, recorded in 2010 by Applied EarthWorks, consists of two artifacts. One is a prehistoric chert flake and the other is an evaporated milk can (Enright and Mirro 2011).

P-33-020317

Originally recorded in 2012 by ASM Affiliates (Torres 2012), this resource is an isolated quartzite hammerstone.

P-33-021134

This isolated find consists of three sherds of Lower Colorado Buffware that may be from the same vessel. The temper is very coarse with inclusions of sand. At the time of the survey, the ground surface visibility was excellent at nearly 100 percent.

P-33-021135

Isolated find P-33-021135 contains four cans, three of which are evaporated milk cans and the fourth a "Coors" beer can with two church key openings.

P-33-021136

This isolated find consists of three prehistoric sherds, all of which are body fragments and probably from the same vessel. The sherds have a grayish tan exterior, a red interior, and a very coarse temper. The largest fragment measures 5.0 by 3.5 centimeters and is 0.4 centimeter thick. The ground surface visibility was 90 percent.

P-33-021137

Isolated find P-33-021137 consists of three historic cans, all of which are key-opened. Two of the cans are crushed, the third has "EST A, 12 42" embossed on the lid. The cans are within a small ephemeral drainage.

4.0 IMPACTS/EFFECTS

This section addresses impacts to cultural resources under CEQA and NEPA; however, the process for assessing effects to historic properties under Section 106 of the NHPA is described briefly in Section 4.1. The site-specific effects will be identified in the joint Environmental Impact Report/Environmental Assessment (EIR/EA) prepared in compliance with CEQA and NEPA.

4.1 Effects Under the National Historic Preservation Act

Under Section 106 of the NHPA, adverse effects to a historic property (i.e., a cultural resource eligible for or listed in the NRHP) can include physical demolition, destruction, relocation, or alteration of the property or its immediate surroundings such that the integrity of the property's location, design, setting, materials, workmanship, feeling, or association would be materially impaired or diminished.

Whenever a historic property cannot be avoided by project activities, adverse effects must be resolved through development of either a Memorandum of Agreement or Programmatic Agreement in consultation with the various consulting parties.

Section 106 regulation states that the regulatory definition of "effect," pursuant to 36 CFR 800.16 (i) is that the term means "alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the NRHP." In practice, a direct effect under Section 106 is that which is a "direct physical disturbance of a historic property." Effects that are immediate but not physical in character, such as visual intrusion, and reasonably foreseeable effects that may occur at some point subsequent to the implementation of the proposed undertaking are referred to as "indirect effects."

Direct effects on historic properties in the Project area could result from ground disturbing activities associated with the construction of the solar generation and transmission facilities, such as clearing vegetation, grading roads, installing underground infrastructure, installing tower foundations, and driving supports for solar arrays.

Historic properties can also be subject to indirect effects, such as changes in public access that increase the potential for vandalism.

4.2 Impacts Under the California Environmental Quality Act

Under CEQA, a project is considered to have an impact on the environment if it alters any characteristics of a historical resource that qualify it for inclusion in the CRHR. Furthermore, it is stated in CEQA that the lead agency may require that reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. CEQA also requires that impacts as defined by PRC 21083.2 must be addressed and mitigated as outlined in PRC 15126.4 and 15331.

Under CEQA, a checklist provides a common set of guidelines that set forth the significance criteria generally applied to cultural resources within the state. The checklist provides questions to be addressed using the following criteria:

- Potentially significant impact
- Less than significant impact with mitigation
- Less than significant impact
- No impact

Three questions pertaining to cultural resources are presented below.

A) Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

B) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

C) Would the project disturb any human remains, including those interred outside of formal cemeteries?

A total of 23 cultural resources have been identified in the APE for one or more of the transmission line alternatives, including 14 other archaeological sites and nine isolated finds.

Table 7 summarizes the anticipated impacts on the 14 archaeological resources within the Project area. Isolated finds are not included in Table 7 because none of them are eligible to the NRHP or CRHR. Only two sites, both of which are within the APE for the Southern Alternative, may be eligible to the NRHP or CRHR, pending further investigation to confirm the presence or absence of subsurface cultural deposits. Adverse effects to either site would occur only if the site is determined eligible.

Under CEQA, impacts would occur only to historical resources (those eligible to the CRHR), unique archaeological resources (none of which have been identified in the Project area), or human remains (none of which have been identified in the Project area) that occur on non-federal land.

Table 7. Archaeological Sites within Project Boundaries

PRIMARY NUMBER	TRINOMIAL	NRHP/CRHR ELIGIBILITY	JURISDICTION	EFFECTS/IMPACTS RECOMMENDATION
Alternative 1				
No archaeological sites				No effect/impact
Northern Alternative				
P-33-017319	CA-RIV-9009	Recommended not eligible	BLM	No effect/impact
P-33-021130	CA-RIV-10962	Recommended not eligible	BLM	No effect/impact
P-33-021132	CA-RIV-10964	Recommended not eligible	BLM	No effect/impact
P-33-021133	CA-RIV-10965	Recommended not eligible	BLM	No effect/impact
Southern Alternative				
P-33-014150	CA-RIV-9100	Determined not eligible by SHPO 2/11/09	BLM/Private	No effect/impact
P-33-019682	CA-RIV-9997	Recommended not eligible	BLM	No effect/impact
P-33-019703	CA-RIV-10018	Recommended not eligible	BLM	No effect/impact
P-33-019714	CA-RIV-10028	Eligible pending further investigation	BLM	Possible effect/impact
P-33-019733	CA-RIV-10047	Recommended not eligible	BLM	No effect/impact
P-33-019736	CA-RIV-10050	Recommended not eligible	BLM	No effect/impact
P-33-019737	CA-RIV-10051	Recommended not eligible	BLM	No effect/impact
P-33-019739	CA-RIV-10053	Recommended not eligible	BLM	No effect/impact

4.2.1 Application of CEQA Significance Thresholds

A) Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

For Alternative 1, no archaeological sites or historical resources were recorded and there would be no impact.

For the Northern Alternative, none of the four archaeological sites recorded have the potential to be found eligible to the NRHP or CRHR, and there would be no impact.

For the Southern Alternative, two archaeological sites recorded during the survey have the potential to be found eligible to the NRHP or CRHR pending further investigation. Both of these occur on BLM land and would be subject to evaluation under Section 106 of NHPA.

B) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

None of the archaeological sites recorded for Alternative 1, the Northern Alternative, and Southern Alternative qualify as unique archaeological resources and there would be no impact.

C) Would the project disturb any human remains, including those interred outside of formal cemeteries?

No human remains have been previously recorded or discovered during surveys for Alternative 1, the Northern Alternative, or the Southern Alternative and, as such, no impacts to this type of resource are anticipated. However, should human remains be discovered on private land at any time during implementation of the Project, construction in the vicinity will halt and the coroner will be contacted immediately (PRC 7050.5). If the coroner determines that the remains do not require an assessment of cause of death and are probably Native American, then the NAHC will be contacted to identify the most likely descendents. Other steps should be implemented according to the requirements of PRC 5097.98.

5.0 RECOMMENDATIONS

Specific cultural resource management recommendations have been developed in consultation with the Applicants and the County Archaeologist. These were developed as part of the CEQA process; mitigation measures to comply with Section 106 of the NHPA and with NEPA will be developed by the BLM and included in the environmental document.

These management recommendations are defined in the Conditions of Approval and pertain to the portion of the Project area that includes privately owned land. The Conditions of Approval include the following:

- Archaeological monitoring shall be conducted by a qualified county-approved Archaeologist who shall manage and oversee archaeological monitoring of all initial ground disturbing activities and excavations of each portion of the Project site.
- A Tribal Observer designated by the Agua Caliente Band of Cahuilla Indians or other designated Tribal representative shall be allowed on-site when the Project Archaeologist is present during all initial ground disturbing activities and excavations for each portion of the Project site.
- A Cultural Resources Monitoring and Mitigation Plan (CRMMP) shall be submitted to the County Archaeologist and the County Historic Preservation Officer (CHPO). The CRMMP shall address the details of all activities that must be completed in order to reduce the impacts to cultural and historical resources to a level that is less than significant. The CRMMP shall define the roles and responsibilities of cultural resource personnel and provides the timelines for the completion of the required mitigation.

During Project construction, if human remains are encountered on private land, the provisions of State Health and Safety Code Section 7050.5 will apply. This code section states that no further disturbance shall occur until the Riverside County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. If the remains are determined to be Native American in origin, the County Coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner and his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC and granting of landowner permission. The MLD may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials.

If human remains are discovered on BLM land, NAGPRA (25 U.S.C. 3001) provides a process for federal agencies to return certain Native American cultural items—human remains, funerary objects, sacred objects, or objects of cultural patrimony—to lineal descendants and culturally affiliated Indian tribes. NAGPRA includes provisions for unclaimed and culturally unidentifiable Native American cultural items, intentional excavation and unanticipated discovery of Native American cultural items on federal lands, and penalties for noncompliance and illegal trafficking. The Secretary of the Interior's implementing regulations are at 43 CFR part 10.

Subject: Limited Geotechnical Evaluation
Blythe Mesa Solar Project
Blythe, California

Dear Mr. Ryan:

In accordance with your authorization, we have performed a limited geotechnical evaluation for the proposed Blythe Mesa Solar Project in Blythe, California. This report presents our geologic findings, conclusions, and preliminary mitigation recommendations regarding the proposed project for inclusion in the Environmental Impact Report. This report incorporates responses to review comments from the County of Riverside. Our report was prepared in accordance with our proposal dated April 22, 2013.

We appreciate the opportunity to be of service on this project.

Sincerely,
NINYO & MOORE

1. INTRODUCTION

In accordance with your request and our proposal dated April 22, 2013, we have performed a limited geotechnical evaluation for the proposed Blythe Mesa Solar Project located in Blythe, California (Figure 1). This report presents our findings, conclusions, and preliminary mitigation recommendations regarding the proposed project for inclusion in the Environmental Impact Report.

2. SCOPE OF SERVICES

Ninyo & Moore's scope of services for this project included review of pertinent background data, performance of a geologic reconnaissance, limited geotechnical evaluation, and analysis with regard to the proposed project. Specifically, we performed the following tasks:

- Reviewing background information including available geotechnical reports, topographic maps, geologic data, fault maps, stereoscopic aerial photographs, and information provided by the client.
- Performing a geologic reconnaissance of the site, including the observation and photo-documentation of existing geologic conditions across the site and an evaluation of possible geologic hazards which may impact the proposed project.
- Performing subsurface exploration consisting of drilling, logging, and sampling four exploratory borings using a truck-mounted drill rig. Representative bulk and in-place soil samples were collected at selected intervals and transported to our laboratory for testing.
- Performing geotechnical laboratory testing of representative samples to evaluate soil characteristics.
- Compiling and analyzing the data obtained.
- Preparing this report presenting our preliminary findings, conclusions, and preliminary mitigation recommendations for inclusion in the Environmental Impact Report.

3. PROJECT AND SITE DESCRIPTION

The Blythe Mesa Solar Project will consist of the construction and operation of a 485-megawatt (MW) solar photovoltaic (PV) electrical generation facility. The proposed project is located on Palo Verde Mesa, north and south of Interstate 10, west of State Route 89, and east of the Blythe Airport, in Riverside County (Figure 1). The 520-MW natural gas-fired Blythe Energy Center

and Buck Substation are present in the north portion of the site. Electrical transmission lines, other solar projects, ancillary agricultural facilities, and dirt roads are present in the site vicinity.

The proposed 3,660-acre site will consist of a PV solar array field, inverters/transformers, interior collection power lines, three on-site substations, two operation and maintenance buildings, access roads, and an 8.4-mile transmission line to the Colorado River Substation.

The review of referenced topographic maps, stereoscopic aerial photographs, and background data indicates the project is situated on the Palo Verde Mesa, south of the Big Maria Mountains, west of the Palo Verde Valley, and west of the Colorado River. The site area is located within the Colorado Desert geomorphic province (Norris & Webb). The project site slopes gently toward the southeast. Elevations range from approximately 390 feet above mean sea level (MSL) in the northwest portion of the site to approximately 335 feet MSL in the southeast portion. Some incised drainage courses in the bluff along the east edge of the Palo Verde Mesa extend down to the Palo Verde Valley. In general vegetation consists of agricultural fields and citrus groves, and open desert with sparse growth of grass and creosote brush.

During the site reconnaissance, the general geologic conditions were observed across the accessible portions of the site. Selected site photographs are attached in Appendix A (Photographs 1 through 8). As discussed, the Blythe Energy Center and related Buck Substation are the dominate features present on the site north of Interstate 10. Other features include current and past agricultural activities, and scattered concrete slabs, asphalt paved roads, and piles of construction debris. Our observations on the portion of the site south of Interstate 10 included an active citrus grove, plowed fields, and former vineyards. Some eolian (blow) sand and areas of gravel (due to wind deflation) were also observed across the site.

4. SUBSURFACE EXPLORATION

Ninyo & Moore's subsurface exploration was conducted on May 14, 2013, and consisted of the drilling, logging, and sampling of four small-diameter borings to depths of up to approximately 51.5 feet. The borings were drilled using a truck-mounted drill rig equipped with 8-inch-diameter

hollow-stem augers. The boring locations were selected based on the results of our background review and field reconnaissance. The approximate locations of the exploratory borings are presented on Figure 2. The logs for the borings are presented in Appendix B.

5. LABORATORY TESTING

Laboratory testing was performed on representative soil samples collected as part of this evaluation included tests to evaluate in-situ moisture content and dry density, gradation, consolidation, shear strength, and soil corrosivity (includes pH, electrical resistivity, chloride content and sulfate content). The results of moisture and density testing are presented on the Ninyo & Moore boring logs in Appendix B. Results of the other Ninyo & Moore laboratory tests are presented in Appendix C.

6. GEOLOGY AND SUBSURFACE CONDITIONS

The findings regarding regional and site geology and groundwater conditions at the subject site are provided in the following sections.

6.1. Regional and Geologic Setting

The project area is situated in the eastern edge of the Colorado Desert Geomorphic Province. Within California, this geomorphic province encompasses an area that extends from the Colorado River on the east, the eastern Transverse Ranges on the north, the Mexican border on the south, and the Peninsular Ranges on the west (Norris and Webb, 1990; Harden, 1998). This portion of the province is characterized by broad alluvial valleys separated by steep, discontinuous, sub-parallel mountain ranges that generally trend northwest-southeast.

6.2. Site Geology

Based on our literature review, including published geologic maps and reports, and our geologic field data the project site is underlain by minor fill material and Quaternary-age alluvium. Surficial deposits of eolian sand (blow sand) and gravels are also present across

portions of the site. Generalized descriptions of the units encountered are provided in the subsequent sections. A geologic map of the region is presented on Figure 3.

6.2.1. Fill

Fill soils associated with previous agricultural activities and road grading are anticipated across much of the site and were encountered in each of our borings from the ground surface extending to depths of approximately 2.5 feet. As encountered, the fill materials generally consist of light brown and brown, dry to damp, loose to medium dense, silty sand. Scattered gravel was encountered in the fill materials.

6.2.2. Alluvium of Modern Washes

Though not encountered in our borings, Holocene age alluvium associated with modern washes (designated Qw) has been mapped near the northeastern portion of the site (United States Geological Survey [USGS], 2006). These deposits are the result of erosion, transport, and deposition of sediments caused by winter storm systems or intense summer thunderstorms. The alluvial materials are generally expected to consist of fine to coarse sand with scattered to abundant gravel to cobble-size clasts.

6.2.3. Alluvium of the Modern Colorado River Flood Plain

Though not encountered in our borings, Holocene age alluvium of the modern Colorado River flood plain (designated Qr), is mapped near the eastern boundary of the project site. These deposits are associated with flood events associated with the Colorado River and are expected to consist of fine to coarse sand, silt, and clay. These deposits are mapped immediately east of the site.

6.2.4. Eolian Sand

Though not encountered in our borings, Holocene age Eolian Sand (designated Qs) is mapped near the western portion of the project under the western portion of the proposed transmission line, and consists of unconsolidated sand dunes and sheets. The dunes are partially stabilized by vegetation.

6.2.5. Alluvial-Fan and Alluvial-Valley Deposits

Though not encountered in our borings, Holocene age alluvial-fan and alluvial-valley deposits (designated Qa_6), are mapped under portions of the proposed transmission line. This unit is characterized by sand, pebbly sand, sandy gravel and occasional eolian sand deposits. These sediments lack desert varnish.

6.2.6. Alluvial Deposits of Palo Verde Mesa

Pleistocene age alluvial deposits Palo Verde Mesa (designated Qpv) were encountered in our borings underlying the fill materials to the total depths explored. As encountered, the alluvial deposits of Pale Verde Mesa generally consist of brown and light brown, dry to damp, loose to very dense, sand, sand with silt, silty sand, and sandy silt. Scattered gravel was encountered in the alluvial deposits.

6.3. Surficial Soils

Review of the referenced soil survey report (United States Department of Agriculture [USDA], 1968) indicates surficial soils are present in the region of the subject site. A map depicting the boundaries of these soils is shown on Figure 4, Soils. A legend and general description of these soils is included on Figure 4A, Regional Soils Legend. A list of the site specific or impact soils and their classifications are shown on Figure 4B, Impacted Soils Legend. As previously discussed, much of the site has been or is currently being utilized for agricultural purposes. It is expected that the upper 1 to 3 feet of soil have been disturbed as a result of agricultural activities.

6.4. Mineral Resources

The review of the report from the Riverside County Planning Department, entitled *Fast Track 2011-01, Blythe Mesa Solar Project*, indicates the site was located in an area classified as MRZ-4 for mineral resources (areas of unknown mineral resource significance), and is not designated as being of regional or statewide significance for mineral resources.

6.5. Groundwater

The static groundwater table is anticipated to be below the depth of proposed excavations. Based on our borings at the Blythe Energy Center (Ninyo & Moore, 1999a), the static water table was found to be in excess of 90 feet below the existing ground surface or an elevation of approximately 245 feet MSL. A static water table was not encountered in our on-site borings that extended to a depth of up to approximately 51.5 feet below the ground surface. According to well data in vicinity of the subject site (California Department of Water Resources, 2013), groundwater levels in the past 40 years have varied in elevation from approximately 240 to 250 feet MSL. Groundwater levels are influenced by seasonal variations, variations in ground surface topography, precipitation, irrigation practices, soil/rock types, groundwater pumping, and other factors and are subject to fluctuations. In addition, shallow perched groundwater or groundwater seepage may also be present, particularly in or near areas of active citrus groves or other agricultural activities. Shallow groundwater can impact ground stability, and foundation design and construction.

7. GEOLOGIC HAZARDS

In general, geologic hazards associated with seismic activity include ground surface rupture, strong ground motion, and liquefaction. These hazards and other geologic considerations such as landslides, debris flows, slope stability, flood hazards, seiches, dam inundation, settlement, collapsible soils, expansive soils, erosion, and regional subsidence are discussed in the following sections.

7.1. Faulting and Seismicity

The subject site is not located within a State of California Earthquake Fault Zone (formerly known as an Alquist-Priolo Special Studies Zone) (Hart and Bryant, 1997). The project area is situated within the Sonoran zone, which is a relatively stable tectonic region located in southeastern California, southwestern Arizona, southern Nevada, and Northern Mexico (Euge and Lam, 1992). As defined by the California Geological Survey (CGS), an active fault is one that has had surface displacement during the Holocene (roughly the last 11,000 years). Potentially active faults are those that show evidence of surface displacement during the Quaternary

(roughly the last 1.6 million years) but for which evidence of Holocene movement has not been established. An inactive fault is one that has not shown evidence of surface displacement during the Quaternary. The approximate locations of the principal active faults in the region and their geographic relationship to the study area are shown on Figure 5, Fault Locations.

Table 1 lists principal known active faults within 60 miles (100 kilometers) of the subject site, the approximate fault-to-site distances, and the maximum moment magnitudes (M_{max}) as published by Cao et al. (2003) for the CGS. The approximate fault-to-site distances were calculated using the computer program FRISKSP (Blake, 2001), and from our review of published geologic maps.

Table 1 – Principal Active Faults

Fault	Approximate Fault-to-Site Distance [1] miles (kilometers)	Maximum Moment Magnitude [2] (M_{max})
Brawley Seismic Zone	57.9 (93.1)	6.4
Elmore Ranch	58.4 (93.9)	6.6
San Andreas (Coachella)	58.4 (94.1)	7.2

Notes:
[1] Blake, 2001
[2] Cao et al., 2003

7.1.1. Strong Ground Motion

The 2010 California Building Code recommends that the design of structures be based on the peak horizontal ground acceleration (PGA) having a 2 percent probability of exceedance in 50 years which is defined as the Maximum Considered Earthquake (MCE). The statistical return period for PGA_{MCE} is approximately 2,475 years. In evaluating the seismic hazards associated with the project site, we have selected a Site Class D. The site modified PGA_{MCE} is an estimated 0.22g using the USGS (USGS, 2011) ground motion calculator (web-based). The design PGA was 0.15g using the USGS ground motion calculator. These estimates of ground motion do not include near-source factors that may be applicable to the design of structures on site.

AR061589

7.1.2. Ground Surface Rupture

As part of our study we have reviewed referenced geologic and fault location maps, 1959 stereoscopic aerial photographs, and relatively recent aerial photographs (2008). The photographs and fault location maps reviewed are listed in the References section of this report.

Our review of the referenced photographs (aerial and stereoscopic) included general analysis of geomorphic landforms within and adjacent to the subject site. Features evaluated included abrupt changes in topography, changes in vegetation, and possible lineaments. As discussed, the topography across the site is relatively flat, with a gentle slope to the southeast. Our review indicated no lineaments or other indications of fault related features across the site. In addition, based on our review of the referenced geologic data and fault location maps, there are no known active faults underlying the site. Accordingly, the potential for surface rupture and lurching or cracking of the ground surface as a result of a nearby seismic event is considered low.

7.1.3. Liquefaction and Seismically Induced Settlement

Liquefaction is the phenomenon in which loosely deposited granular soils and non-plastic silts located below the water table undergo rapid loss of shear strength when subjected to strong earthquake-induced ground shaking. Ground shaking of sufficient duration results in the loss of grain-to-grain contact due to a rapid rise in pore water pressure, and causes the soil to behave as a fluid for a short period of time. Liquefaction is known generally to occur in saturated or near-saturated cohesionless soils at depths shallower than 50 feet below ground surface. Factors known to influence liquefaction potential include composition and thickness of soil layers, grain size, relative density, groundwater level, degree of saturation, and both intensity and duration of ground shaking.

A review of Riverside County Integrated Project Figure S-3 indicates the site is mapped within a zone described as “moderately susceptible” liquefaction associated with deep groundwater. However, our borings at the site indicate that groundwater is at a depth

greater than 50 feet. Based on the lack of shallow groundwater, it is our opinion that liquefaction and seismically induced settlement at the site are not design considerations.

7.2. Landslide and Debris Flows

Landslides may be induced by strong vibratory motion produced by earthquakes. Research and historical data indicate that seismically induced landslides tend to occur in weak soil and rock on sloping terrain. The process for zoning earthquake-induced landslides incorporates expected future earthquake shaking, existing landslide features, slope gradient and strength of earth materials on the slope. Based on review of Riverside County Integrated Project Figure S-4 and on the relatively gentle slopes in areas underlain by alluvium and the relatively dense nature of the older alluvium, the potential for seismically induced landslides and debris flows at the site is not considered likely. In addition, no landslides, debris flows or rock falls are known to present on the site based on the site reconnaissance and review of referenced documents.

7.3. Slope Stability

The review of topographic maps and preliminary project plans indicates that the proposed project will be located adjacent to the descending bluff located along the east site boundary. A review of Riverside County Integrated Project, Figure S-5, indicated this slope have a low to locally moderate susceptibility to seismically induced landslides and rockfalls. A review of the available project documents suggest that proposed improvements are not anticipated to be constructed on or near to the bluff slope.

7.4. Flood Hazard

The subject site is located on relatively flat to gently sloping terrain, west of the Colorado River. Our review of data on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) website, and Riverside County Integrated Project Figure S-9, Flood Prone Areas, indicates that the site is not located within a 100- or 500-Year Flood Zone.

7.5. Seiches

Review of topographic maps and aerial photographs do not indicate the presence of relatively large bodies of water (lakes, reservoirs, oceans) in the vicinity of the site. Several small irrigation reservoirs are located in the orchard areas of the site. These reservoirs will be removed as a result of the proposed project. Accordingly, seiches are not a design consideration.

7.6. Dam Inundation

Parker Dam on the Colorado River is located approximately 50 miles north-northeast of the project site. Review of the Riverside County Integrated Project, Figure 10, indicates the proposed project is not within a Dam Hazard Zone. Further, a review of topographic maps indicates that the site is on the order of 75 feet above existing river levels. Based on the topographic elevation above the Colorado River and the relatively broad nature of the Palo Verde Valley, inundation due to a failure of the Parker Dam is not expected to affect the project site.

7.7. Settlement

Based on the review of the referenced geotechnical report for the Blythe Energy Center, our geologic reconnaissance, and our subsurface evaluation, the underlying alluvium is expected to consist of loose to dense layers of silty sands, sands, and gravel. The soil encountered in our borings in the upper 2.5 feet has been plowed and disturbed and is in a loose condition. In boring B-2 loose material was encountered to a depth of approximately 7.5 feet. Materials below these depths were found to be medium dense or denser. Accordingly, some settlement of the loose soils underlying the near surface is possible.

7.8. Hydro-consolidation or Soil Collapse

Hydro-consolidation or Soil Collapse typically occurs in recently deposited, Holocene (less than 10,000 years old) soils that were deposited in an arid or semi-arid environment. Soils prone to collapse are commonly associated with man-made fill, wind-laid sands and silts, and alluvial fan and mudflow sediments deposited during flash floods. These soils typically contain minute pores and voids. The soil particles may be supported by clay or silt, or

chemically cemented with carbonates. When saturated, collapsible soils undergo rearrangement of their grains, and the water removes the cohesive (or cementing) material, this results in rapid substantial settlement (Riverside County Integrated Project).

Based on our subsurface exploration and laboratory testing data, the hydro-consolidation potential of the soils is moderate. Additional hydro-consolidation tests should be performed to verify this during the design stages of the project.

7.9. Expansive Soils

Expansive soils generally result from specific clay minerals that have the capacity to shrink or swell in response to changes in moisture content. Based on a review of regional geologic maps and our subsurface exploration, the deposits underlying the project site consist of relatively granular alluvial deposits. It is expected that grading recommendations would likely be specified as granular. Therefore, the potential for near-surface expansive soils at the project is considered low.

7.10. Erosion

In general, erosion refers to the process by which soil or earth material is loosened or dissolved and removed from its original location. Erosion can occur by varying processes and may occur in the project area where bare soil (or rock) is exposed to wind or moving water (both rainfall and surface runoff). The processes of erosion are generally a function of material type, terrain steepness, rainfall or irrigation levels, surface drainage conditions, wind velocity, and general land use. Review of geologic maps and soil data indicate that surface soils are generally comprised of sand and gravels. Based on the gentle gradients across the site, the potential for water erosion is low. However, portions of the site situated along the east boundary may be subject to water erosion down the bluff face.

Our observations indicated areas of eolian deposits (wind deposited) and areas of deflation (coarse sand and gravel concentrated due to wind erosion of the fine-grain silts and sands) are present across portions of the site. The presence of eolian sand across the site indicates that the site has been historically subject to moderate to relatively high winds. Based on review of Riverside County Integrated Project Figure S-8, the project site is moderately to highly susceptible to wind erosion.

7.11. Regional Subsidence

Subsidence is characterized as the sudden or gradual downward settling of the ground surface relative to surrounding areas, and can generally occur where deep alluvial deposits are present in valley areas. Subsidence in alluvial valley areas is typically associated with groundwater withdrawal or other fluid withdrawal from the subsurface such as oil and natural gas. Extraction of these geologic components can cause subsidence, which can result in the development of surface ground cracks and fissures, particularly near valley margins. Cracks and earth fissures can cause damage to improvements including roads, transmission lines, foundations, structures and pipelines. Review of Riverside County Integrated Project Subsidence Zone map (Figure S-7), the project area is located in a "Susceptible Area" with regard to potential subsidence. However, our review of Figure S-7 indicates the site is located outside of "Areas of Documented Subsidence".

During our site reconnaissance, we did not observe ground cracks or earth fissures. We note however that the site is generally covered with a mantle of eolian sand, or active or plowed agricultural fields that may conceal underlying cracks or fissures.

8. CONCLUSIONS

Based on our the results of our study, it is our opinion that construction of the proposed Blythe Mesa Solar Project is feasible from a geologic standpoint provided that the recommendations of this report are incorporated into the preliminary design of the project. Prior to final project design, additional subsurface geotechnical evaluation should be performed to further evaluate site-specific geotechnical conditions.

9. RECOMMENDATIONS

The potential geologic and seismic impacts that may affect the Blythe Mesa Solar Project may be mitigated by employing sound engineering practice in the planning, design and construction of the new improvements proposed for the project. This practice includes performance of the following general and specific techniques as part of the design and construction of the subject project.

9.1. Strong Ground Motion

Site-specific evaluation of the potential ground-shaking hazard for the proposed project would be performed prior to final design and construction so that appropriate structural design and mitigation techniques can be implemented. This evaluation would involve the use of geotechnical software programs utilizing site latitudinal and longitudinal coordinates and general site geologic information to evaluate the potential levels of ground shaking at the project site. Where deemed appropriate during project design, site-specific geotechnical evaluations to assess the subsurface characteristics of the on-site earth materials with regard to ground shaking could be performed. Subsurface data could be obtained through exploratory excavations and laboratory testing of soils.

Mitigation of the potential impacts of seismic ground shaking can be achieved through project design. During the design phase, site-specific geotechnical evaluations would be performed to analyze the site-specific ground motion anticipated for the improvements. Site-specific evaluation of the potential ground shaking hazard would involve an evaluation to develop seismic design parameters for use by the project structural engineer. Structural elements can then be designed to resist or accommodate appropriate site-specific ground motions and to conform to the current seismic design standards.

9.2. Ground Surface Rupture

Based on the review of the referenced fault location maps, aerial photo review, and site reconnaissance, there are no known active faults underlying the proposed project site. Accordingly, the potential for surface rupture and lurching or cracking of the ground surface as a result of a nearby seismic event is considered low. However, should future data suggest

the presence of active faulting at the project site, a fault evaluation may be performed. Such an evaluation may include review of geologic and fault location maps, a geologic reconnaissance to observe the earth units and geomorphology, and performance of a subsurface exploration to evaluate fault locations and conditions. Subsurface exploration might include the excavation and detailed logging of exploratory trenches and/or borings, geophysical studies such as high resolution seismic reflection, seismic refraction, ground penetrating radar, gravity and/or magnetic profiling or other applicable methods.

Recommendations for mitigation of potential fault rupture hazard would typically include locating improvements away from the trace of an active fault, designing structures for an acceptable amount of movement, or implementing systems to maintain safety and that allow for displacement that could be repaired.

9.3. Liquefaction and Seismically Induced Settlement

Liquefaction is the phenomenon in which loosely deposited granular soils and non-plastic silts located below the water table undergo rapid loss of shear strength when subjected to strong earthquake-induced ground shaking. Ground shaking of sufficient duration results in the loss of grain-to-grain contact due to a rapid rise in pore water pressure, and causes the soil to behave as a fluid for a short period of time. Liquefaction is known generally to occur in saturated or near-saturated cohesionless soils at depths shallower than 50 feet below ground surface. Factors known to influence liquefaction potential include composition and thickness of soil layers, grain size, relative density, groundwater level, degree of saturation, and both intensity and duration of ground shaking.

Based on our borings at the site, groundwater is at a depth greater than 50 feet. Therefore, liquefaction is not a design consideration. However, liquefaction should be re-evaluated when additional subsurface geotechnical evaluation is performed prior to final design. In general, mitigation for construction in liquefaction zones may include in-situ ground modification, removal of liquefiable layers and replacement with compacted fill, or support of project improvements with piles at depths designed to mitigate damage from liquefaction.

9.4. Landsliding

The subject site is located on relatively flat terrain that is not subject to landslides. The background review did not indicate the presence of landslides on or near to the subject property. Therefore, potential for landslides is not a design consideration. Accordingly, no recommendations pertaining to this issue are warranted.

9.5. Flood Hazard

To evaluate the potential for flooding, additional review of available data including a detailed hydrologic evaluation could be performed to assess the risks and potential effects of flooding. An evaluation of the flood hazard potential would be performed prior to final design and construction.

Measures to mitigate the potential for flooding may include raising the elevation of the proposed site improvements to keep them elevated above the potential flood level, and construction of berms, levees, and drainage channels.

9.6. Settlement

As noted, the underlying alluvium is expected to consist of loose to dense layers of silty sands, sands, and gravel. The soil encountered in our borings in the upper 2.5 feet has been plowed and disturbed and is in a loose condition. In boring B-2 loose material was encountered to a depth of approximately 7.5 feet. Materials below these depths were found to be medium dense or denser. Accordingly, some settlement of the loose soils underlying the near surface is possible.

Examples of possible mitigation for loose soils with potential for settlement include removal of the loose soil layers and replacement with compacted fill or specialized foundation design including the use of deep foundation systems to support structures.

AR061597

9.7. Hydro-consolidation or Soil Collapse

Hydro-consolidation or Soil Collapse typically occurs in recently deposited, Holocene (less than 10,000 years old) soils that were deposited in an arid or semi-arid environment. Soils prone to collapse are commonly associated with man-made fill, wind-laid sands and silts, and alluvial fan and mudflow sediments deposited during flash floods. These soils typically contain minute pores and voids. The soil particles may be supported by clay or silt, or chemically cemented with carbonates. When saturated, collapsible soils undergo rearrangement of their grains, and the water removes the cohesive (or cementing) material, this results in rapid substantial settlement (Riverside County Integrated Project).

Based on our subsurface exploration and laboratory testing data, the hydro-consolidation potential of the soils is low. However, additional hydro-consolidation tests should be performed to verify this during the design stages of the project. The mitigation recommendations for hydro-consolidation may include removal of the collapsible soil layers and replacement with compacted fill or specialized foundation design including the use of deep foundation systems to support structures.

9.8. Expansive Soils

Based on a review of regional geologic maps and our subsurface exploration, the deposits underlying the project site consist of relatively granular alluvial deposits. It is expected that grading recommendations would likely be specified as granular. Therefore, the potential for near-surface expansive soils at the project is considered low.

However, further evaluation of the potential for expansive soils to affect the proposed project components should be performed prior to final design and construction so that, in the event the hazard exists, mitigation techniques can be implemented. Mitigation for expansive soils may include techniques such as overexcavation and replacement with non-expansive soil, moisture control, and/or specific structural design for expansive soil conditions developed during design of the project.

9.9. Erosion

Construction for the proposed project is anticipated to create the potential for soil erosion during excavation, grading, and trenching activities. With the implementation of prudent site practices during construction, water and wind related soil erosion can be reduced within construction site boundaries. Such procedures may include appropriate surface drainage measures for erosion due to water, the use of erosion prevention mats or geofabrics, silt fencing, sandbags and plastic sheeting, and temporary drainage devices. Positive surface drainage should be developed and maintained at project construction sites to provide surface runoff to flow away from site improvements, slope faces or other areas susceptible to erosion.

As discussed previously, the site soils will be subject to wind erosion. To mitigate wind-related erosion, wetting of soil surfaces and/or covering exposed ground areas and soil stockpiles could be considered during construction operations, as appropriate. In addition, the use of tackifiers may be considered to reduce the potential for water- and wind-related soil erosion.

Long-term erosion potential can be mitigated through prudent site design and maintenance practices. Design procedures can be performed to reduce soil erosion such as appropriate surface drainage and design of roadways to provide for positive surface runoff. Design would address reducing concentrated run-off conditions that could cause erosion rilling and affect the stability of project improvements. The use of erosion control fabrics and roadway drainage devices can be designed and maintained to reduce erosion processes. As appropriate, a Storm Water Pollution Prevention Plan that would include the use of Best Management Practices should be developed for the construction site.

9.10. Regional Subsidence

Subsidence is characterized as the sudden or gradual downward settling of the ground surface relative to surrounding areas, and generally occurs where deep alluvial deposits are present in valley areas. Based on our review of Riverside County Integrated Project Subsidence Zone map (Figure S-7), the project area is located in a "Susceptible Area" with regard to potential subsidence. However, our review of Figure S-7 indicates the site is located outside of "Areas of Documented Subsidence".

If additional data should become available regarding the potential for subsidence and/or the presence of earth fissures underlying the proposed project area, a geologic evaluation should be performed. Such an evaluation would include review of geologic and topographic maps, performance of a geologic reconnaissance to observe and map the geomorphology, review of groundwater well records and well pumping history, and performance of a subsurface exploration to evaluate possible fissures concealed by eolian or other surficial sediments. A subsurface evaluation might include the excavation and detailed logging of exploratory trenches and/or borings, geophysical studies such as high resolution seismic reflection, seismic refraction, ground penetrating radar, gravity and/or magnetic profiling or other applicable methods.

Mitigation of potential subsidence and earth fissure hazard would typically include locating improvements away from the trace of an active fissure, designing structures for an acceptable amount of movement, minimization of groundwater pumping to allow recovery of water table levels at or above historic levels, or implementing systems to allow for displacement that could be repaired.

9.11. Corrosion

Laboratory testing was performed on a representative sample of the on-site earth materials to evaluate pH and electrical resistivity, as well as chloride and sulfate contents. The pH and electrical resistivity tests were performed in accordance with California Test (CT) 643 and the sulfate and chloride content tests were performed in accordance with CT 417 and CT 422, respectively. These laboratory test results are presented in Appendix C.

The results of the corrosivity testing indicated an electrical resistivity of 660 ohm-cm, a soil pH of 8.5, a chloride content of 390 parts per million (ppm) and a sulfate content of 0.029 percent (i.e., 290 ppm). Based on the Caltrans corrosion (2012) criteria and ACI 318 the on-site soils would be classified as corrosive. Corrosive soils are defined as the soils with electrical resistivities less than 1,000 ohm-cm, more than 500 ppm chlorides, more than 0.1 percent sulfates, or a pH less than 5.5. Mitigation recommendations for corrosive soils would typically include designing the structural elements to resist corrosion.

10. LIMITATIONS

This report was prepared to evaluate geologic site constraints in support of the environment impact document. Prior to design, a site specific geotechnical evaluation should be performed which includes subsurface exploration. The field evaluation, and geotechnical analyses presented in this geotechnical report have been conducted in general accordance with current practice and the standard of care exercised by geotechnical consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions, recommendations, and opinions presented in this report. Variations may exist and conditions not observed or described in this report may be encountered during construction. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Our evaluation was limited to assessment of the geotechnical aspects of the project, and did not include evaluation of structural issues, environmental concerns, or the presence of hazardous materials.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. If geotechnical conditions different from those described in this report are encountered, our office should be notified, and additional recommendations, if warranted, will be provided upon request. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no controls.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

BORING LOGS

Field Procedure for the Collection of Disturbed Samples

Disturbed soil samples were obtained in the field using the following methods.

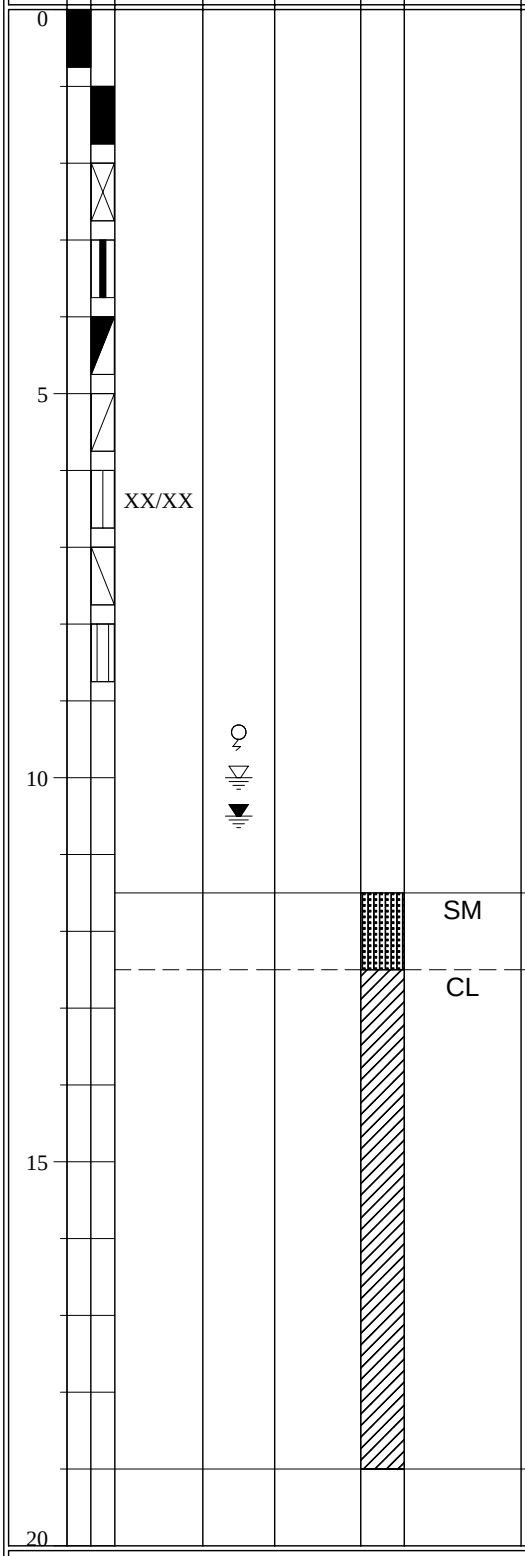
Bulk Samples

Bulk samples of representative earth materials were obtained from the exploratory borings. The samples were bagged and transported to the laboratory for testing.

The Standard Penetration Test (SPT) Sampler

Disturbed drive samples of earth materials were obtained by means of a Standard Penetration Test sampler. The sampler is composed of a split barrel with an external diameter of 2 inches and an unlined internal diameter of 1-3/8 inches. The sampler was driven into the ground 12 to 18 inches with a 140-pound hammer free-falling from a height of 30 inches in general accordance with ASTM D 1586. The blow counts were recorded for every 6 inches of penetration; the blow counts reported on the logs are those for the last 12 inches of penetration. Soil samples were observed and removed from the sampler, bagged, sealed and transported to the laboratory for testing.

Field Procedure for the Collection of Relatively Undisturbed Samples



Relatively undisturbed soil samples were obtained in the field using the following methods.

The Modified Split-Barrel Drive Sampler

The sampler, with an external diameter of 3.0 inches, was lined with 1-inch long, thin brass rings with inside diameters of approximately 2.4 inches. The sample barrel was driven into the ground with the weight of a hammer in general accordance with ASTM D 3550. The driving weight was permitted to fall freely. The approximate length of the fall, the weight of the hammer, and the number of blows per foot of driving are presented on the boring logs as an index to the relative resistance of the materials sampled. The samples were removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

Attachment I-8

BORING LOG EXPLANATION SHEET

Bulk sample.

Modified split-barrel drive sampler.

No recovery with modified split-barrel drive sampler.

Sample retained by others.

Standard Penetration Test (SPT).

No recovery with a SPT.

Shelby tube sample. Distance pushed in inches/length of sample recovered in inches.

No recovery with Shelby tube sampler.

Continuous Push Sample.

Seepage.

Groundwater encountered during drilling.

Groundwater measured after drilling.

MAJOR MATERIAL TYPE (SOIL):
Solid line denotes unit change.

Dashed line denotes material change.

Attitudes: Strike/Dip
b: Bedding
c: Contact
j: Joint
f: Fracture
F: Fault
cs: Clay Seam
s: Shear
bss: Basal Slide Surface
sf: Shear Fracture
sz: Shear Zone
sbs: Shear Bedding Surface

The total depth line is a solid line that is drawn at the bottom of the boring.

U.S.C.S. METHOD OF SOIL CLASSIFICATION

MAJOR DIVISIONS		SYMBOL	TYPICAL NAMES
COARSE-GRAINED SOILS (More than 1/2 of soil > No. 200 Sieve Size)	GRAVELS (More than 1/2 of coarse fraction > No. 4 sieve size	GW	Well graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	SANDS (More than 1/2 of coarse fraction < No. 4 sieve size	SW	Well graded sands or gravelly sands, little or no fines
		SP	Poorly graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (More than 1/2 of soil < No. 200 sieve size)	SILTS & CLAYS Liquid Limit <50	ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		OL	Organic silts and organic silty clays of low plasticity
	SILTS & CLAYS Liquid Limit >50	MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic clays of medium to high plasticity, organic silty clays, organic silts
HIGHLY ORGANIC SOILS		Pt	Peat and other highly organic soils

GRAIN SIZE CHART

CLASSIFICATION	RANGE OF GRAIN	
	U.S. Standard Sieve Size	Grain Size in Millimeters
BOULDERS	Above 12"	Above 305
COBBLES	12" to 3"	306 to 76.2
GRAVEL	3" to No. 4	76.2 to 4.76
Coarse	3" to 3/4"	76.2 to 19.1
Fine	3/4" to No. 4	19.1 to 4.76
SAND	No. 4 to No. 200	4.76 to 0.075

APPENDIX C

LABORATORY TESTING

Classification

Soils were visually and texturally classified in accordance with the Unified Soil Classification System (USCS) in general accordance with ASTM D 2488. Soil classifications are indicated on the logs of the exploratory borings in Appendix B.

Moisture Content

The moisture content of a sample obtained from the exploratory boring was evaluated in accordance with ASTM D 2216. The test results are presented on the logs of the exploratory borings in Appendix B.

In-Place Moisture and Density Tests

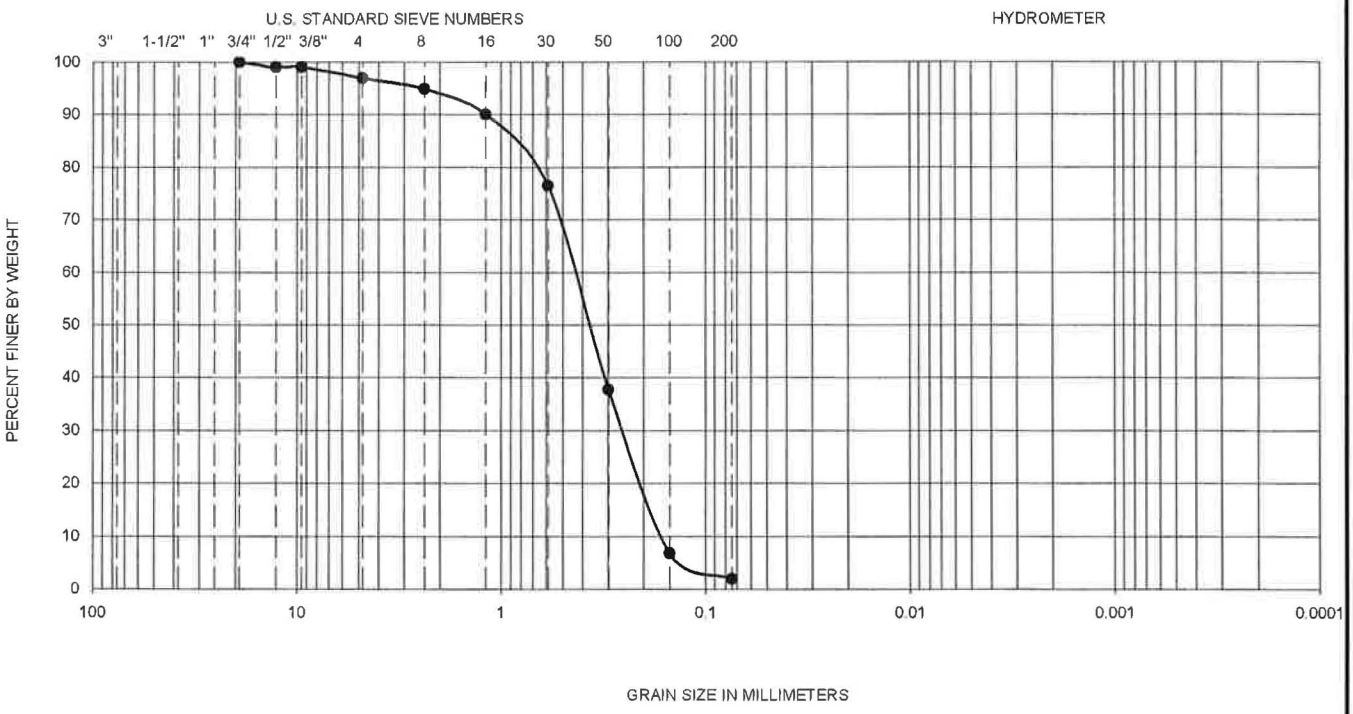
The moisture content and dry density of relatively undisturbed samples obtained from the exploratory borings were evaluated in general accordance with ASTM D 2937. The test results are presented on the logs of the exploratory borings in Appendix B.

Gradation Analysis

Gradation analysis tests were performed on selected representative soil samples in general accordance with ASTM D 422. The grain-size distribution curves are shown on Figures C-1 and C-2. These test results were utilized in evaluating the soil classifications in accordance with the Unified Soil Classification System (USCS).

Consolidation Tests

Consolidation tests were performed on selected relatively undisturbed soil samples in general accordance with ASTM D 2435. The samples were inundated during testing to represent adverse field conditions. The percent of consolidation for each load cycle was recorded as a ratio of the amount of vertical compression to the original height of the sample. The results of the tests are summarized on Figures C-3 and C-4.



Direct Shear Tests

Direct shear tests were performed on relatively undisturbed samples in general accordance with ASTM D 3080 to evaluate the shear strength characteristics of selected materials. The samples were inundated during shearing to represent adverse field conditions. The results are shown on Figures C-5 and C-6.

Soil Corrosivity Tests

Soil pH, and resistivity tests were performed on representative samples in general accordance with California Test (CT) 643. The soluble sulfate and chloride content of selected samples were evaluated in general accordance with CT 417 and CT 422, respectively. The test results are presented on Figure C-7.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 02/25/2011 has revealed that there are 2 CERC-NFRAP sites within the searched area.

Site	Address	Map ID	Page
FARMER AIR SERVICE	***17500 W HOBSON WAY***	***5***	***104***
WEST COAST FLYING SERVICE	***13-400 W 14TH SAVE***	***7***	***107***

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/09/2011 has revealed that there are 2 CORRACTS sites within the searched area.

FARMER AIR SERVICE	***17500 W HOBSON WAY***	***5***	***104***
WEST COAST FLYING SERVICE	***13-400 W 14TH SAVE***	***7***	***107***

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 06/15/2011 has revealed that there are 2 RCRA-NonGen sites within the searched area.

Site	Address	Map ID	Page

WEST COAST FLYING SERVICE	***13-400 W 14TH SAVE***	***7***	***107***

EXECUTIVE SUMMARY

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 04/14/2010 has revealed that there are 2 FINDS sites within the searched area.

FARMER AIR SERVICE	***17500 W HOBSON WAY***	***5***	***104***
WEST COAST FLYING SERVICE	***13-400 W 14TH SAVE***	***7***	***107***

STATE AND LOCAL RECORDS

WMUDS/SWAT: The Waste Management Unit Database System is used for program tracking and inventory of waste management units. The source is the State Water Resources Control Board.

A review of the WMUDS/SWAT list, as provided by EDR, and dated 04/01/2000 has revealed that there is 1 WMUDS/SWAT site within the searched area.

Site	Address	Map ID	Page
BLYTHE AIRPORT DUMP	***BLYTHE AIRPORT***	***2***	***3***

HIST CORTESE: The sites for the list are designated by the State Water Resource Control Board [LUST], the Integrated Waste Board [SWF/LS], and the Department of Toxic Substances Control [CALSITES].

A review of the HIST CORTESE list, as provided by EDR, and dated 04/01/2001 has revealed that there are 3 HIST CORTESE sites within the searched area.

Site	Address	Map ID	Page
SUNWORLD #1	***15550 WEST HOBSONWAY***	***3***	***6***
BLYTHE LEMON RANCH #41	15550 HOBSONEWAY	3	102
BLYTHE AIRPORT	***17240 HOBSONWAY***	***4***	***102***

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 08/09/2011 has revealed that there are 4 LUST sites within the searched area.

WOTEN AVIATION - BLYTHE	17798 BLYTHE WAY	6	107

HIST UST: Historical UST Registered Database.

A review of the HIST UST list, as provided by EDR, and dated 10/15/1990 has revealed that there is 1 HIST UST site within the searched area.

Site	Address	Map ID	Page
BLYTHE RCAG	BLYTHE AFSFO	2	3

CHMIRS: The California Hazardous Material Incident Report System contains information on reported hazardous material incidents, i.e., accidental releases or spills. The source is the California Office of Emergency Services.

A review of the CHMIRS list, as provided by EDR, and dated 12/31/2010 has revealed that there is 1 CHMIRS site within the searched area.

Site	Address	Map ID	Page
BLYTHE AIRPORT DUMP	***BLYTHE AIRPORT***	***2***	***3***

AST: The Aboveground Storage Tank database contains registered ASTs. The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the AST list, as provided by EDR, and dated 08/01/2009 has revealed that there is 1 AST site within the searched area.

Event date: 05/31/1989
Event: CA029WQ

Event date: 05/31/1989
Event: CA Prioritization, Facility or area was assigned a low corrective action priority.

Event date: 05/31/1989
Event: CA049PA

Event date: 08/31/1989
Event: CA049SI

Event date: 07/29/1992
Event: CA Prioritization, Facility or area was assigned a low corrective action priority.

Event date: 07/29/1992
Event: Stabilization Measures Evaluation,This facility is not amenable to stabilization activity at the present time for reasons other than 1- it appears to be technically infeasible or inappropriate (NF) or 2- there is a lack of technical information (IN). Reasons for this conclusion may be the status of closure at the facility, the degree of risk, timing considerations, the status of corrective action work at the facility, or other administrative considerations.

Event date: Not reported
Event: CA03192

Violation Status: No violations found

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 06/30/2011
Date Data Arrived at EDR: 07/12/2011
Date Made Active in Reports: 09/29/2011

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 06/30/2011

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Next Scheduled EDR Contact: 11/28/2011
Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/25/2011
Date Data Arrived at EDR: 03/01/2011

Last EDR Contact: 09/01/2011
Next Scheduled EDR Contact: 12/12/2011
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

FINDS: Facility Index System/Facility Registry System

Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 04/14/2010
Date Data Arrived at EDR: 04/16/2010

Next Scheduled EDR Contact: 12/26/2011
Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995
Date Data Arrived at EDR: 07/03/1995
Date Made Active in Reports: 08/07/1995

Last EDR Contact: 10/14/2011
Next Scheduled EDR Contact: 01/23/2012
Data Release Frequency: Varies

US HIST CDL: National Clandestine Laboratory Register

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 09/01/2007
